Flat bottomed and fire-heated stills are considered the best for the distillation of malt spirit, as by them the flavour is preserved. Coffey's still, on the other hand, is the best for the distillation of grain spirit, as by it a spirit is obtained almost entirely destitute of flavour, and of a strength varying from 55 to 70 over proof. Spirit produced of this high strength evaporates at such a low temperature that scarcely any of the volatile oils on which the peculiar flavour of spirits depends are evaporated with it, hence the reason why it is not adapted for the distillation of malt whisky, which requires a certain amount of these oils to give it its requisite flavour. The spirit produced by Coffey's still is, therefore, chiefly used for making gin and factitious brandy by the rectifiers, or for being mixed with malt whiskies by the wholesale dealers.

As the preparation of alcoholic spirit is the most important industry in which the operation of distillation occupies a prominent place, the establishments in which the manufacture is conducted are known as distilleries. But there are many other important industries in which distillation is an essential feature, being in them employed either for the separation, purification, or concentration of various products. A large proportion of the essential oils are, for example, obtained by the distillation of the substances containing them from water or a mixture of salt and water. The treatment of other bodies in which distillation plays a part will be found under their respective headings.

(W. D.—J. P.A.)

DISTRESS is one of the few cases in which the law still permits an injured person to take his remedy into his own hands. Other instances mentioned in the text-books are self-defence in the case of a personal assault, the

re seizure of property wrongfully taken away, the abatement of nuisances, &c. Distress differs from these as being a remedy for what is really a breach of contract, and it is the only case of the kind in which such a remedy is given. It is the right which the landlord has of seizing the personal chattels of his tenant for non-payment of rent. *Cattle damage feasant* (doing damage or trespassing upon a neighbour's land) may also be *distrained*, i.e., may be detained until satisfaction be rendered for the injury they have done. The cattle or other animals thus distrained are a mere pledge in the hands of the injured person, who has only power to retain them until the owner appear to make satisfaction for the mischief they have done. Distress for rent was also at one time regarded as a mere pledge or security, but the remedy, having been found to be speedy and efficacious, was rendered more perfect by enactments allowing the thing taken to be sold. Blackstone notes that the law of distresses in this respect "has been greatly altered within a few years last past." The legislature, in fact, converted an ancient right of personal redress into a powerful remedy for the exclusive benefit of a single class of creditors, viz., landlords. Now that the relation of landlord and tenant in England has come to be regarded as purely a matter of contract, the language of the law-books seems to be singularly inappropriate. The defaulting tenant is a "wrong doer," the landlord is the "injured party," any attempt to defeat the landlord's remedy by carrying off distrainable goods is denounced as "fraudulent and knavish." The operation of the law has, as we shall point out, been mitigated in one important respect by a recent Act, but it still remains an almost unique specimen of one-sided legislation.

At common law distress was said to be incident to *rent service*, and by particular reservation to rent charges, but by 4 Geo II c. 28 it was extended to *rent seek*, *rents of assize*, and chief rents (see **RENT**.) It is therefore a general remedy for rent certain in arrear. All personal chattels are distrainable with the following exceptions—1, things in which there can be no property, as animals *ferre naturæ*, 2, things in actual use, 3, things delivered to a person following a public trade, as a horse sent to be shod, &c., 4, things already in the custody of the law, 5, money, unless placed in a sealed bag, 6, things which cannot be restored in as good a plight as when distrained, 7, fixtures, 8, beasts of the plough and instruments of husbandry, 9, instruments of a man's trade or profession. These exceptions, it will be seen, imply that the thing distrained is to be held as a pledge merely—not to be sold. They also imply that in general any chattels found on the land in question are to be available for the benefit of the landlord, whether they belong to the tenant or not. This principle worked with peculiar harshness in the case of lodgers, whose goods might be seized and sold for the payment of the rent due by their landlord to his superior landlord. Now, however, by the Lodgers' Goods Protection Act (34 and 35 Vict c. 79), where a lodger's goods have been seized by the superior landlord the lodger may serve him with a notice stating that the intermediate landlord has no interest in the property seized, but that it is the property or in the lawful possession of the lodger, and setting forth the amount of the rent due by the lodger to his immediate landlord. On payment or tender of such rent the landlord cannot proceed with the distress against the goods in question. And originally the landlord could only seize things actually on the premises, so that the remedy might be defeated by the things being taken away. But by 9 Anne c. 14, and 11 Geo II c. 19, he may follow things fraudulently or clandestinely removed off the premises within thirty days after their removal, unless they have been in the meantime *bona fide* sold for a valuable consideration.

The sixth exception mentioned above was held to extend to sheaves of corn; but by 2 Will. and Mary c 5, corn, when reaped, as well as hay, was made subject to distress.

Excessive or disproportionate distress exposes the distrainer to an action, and any irregularity formerly made the proceedings void *ab initio*, so that the remedy was attended with considerable risk. The statute 11 Geo II c 19, before alluded to, in the interests of landlords, protected distresses for rent from the consequences of irregularity. In all cases of distress for rent, if the owner do not within

five days replevy the same with sufficient security, the thing distrained may be sold towards satisfaction of the rent and charges, and the surplus, if any, must be returned to the owner. To "replevy" is when the person distrained upon applies to the proper authority (the registrar of the county court) to have the thing returned to his own possession, on giving security to try the right of taking it in an action of replevin.

Duties and penalties imposed by Act of Parliament are sometimes enforced by distress

D I S T R I B U T I O N

THE subject specially discussed under this heading is the Distribution of Life, Animal and Vegetable, in Space and Time

So long as each species of organism was supposed to have had an independent origin, the place it occupied on the earth's surface or the epoch where it first appeared had little significance. It was, indeed, perceived that the organization and constitution of each animal or plant must be adapted to the physical conditions in which it was placed; but this consideration only accounted for a few of the broader features of distribution, while the great body of the facts, their countless anomalies and curious details, remained wholly inexplicable. But the theory of evolution and gradual development of organic forms by descent and variation (some form of which is now universally accepted by men of science) completely changes the aspect of the question and invests the facts of distribution with special importance. The time when a group or a species first appeared, the place of its origin, and the area it now occupies upon the earth, become essential portions of the history of the universe. The course of study initiated and so largely developed by Mr Darwin has now shown us the marvellous interdependence of every part of nature. Not only is each organism necessarily related to and affected by all things, living and dead, that surround it, but every detail of form and structure, of colour, food, and habits, must—it is now held—have been developed in harmony with, and to a great extent as a result of, the organic and inorganic environments. Distribution becomes, therefore, as essential a part of the science of life as anatomy or physiology. It shows us, as it were, the form and structure of the life of the world considered as one vast organism, and it enables us to comprehend, however imperfectly, the processes of development and variation during past ages which have resulted in the actual state of things. It thus affords one of the best tests of the truth of our theories of development; because, the countless facts presented by the distribution of living things in present and past time must be explicable in accordance with any true theory, or at least must never directly contradict it.

From these indications of the scope and bearing of the subject, it will be seen that its full and adequate treatment would require volumes, and would necessarily involve an amount of details only suited to specialists in the various branches of natural history. All that can be attempted here is to give such a general sketch of the whole subject as to place the reader in possession of the main results arrived at, and enable him to comprehend the bearing of the more detailed information he may meet with elsewhere.

Arrangement of the Subject—The three great heads under which the various matters connected with distribution may be classed are—1st, the geographical distribution of living organisms; 2d, the geographical distribution of extinct organisms; and 3d, the geological succession of the chief forms of life. Owing, however, to the fact that the study

of animals and of plants form very distinct sciences, and that there are special peculiarities in the phenomena presented by each which require to be carefully discriminated, it is found to be necessary to make a primary division of the subject into the distribution of animals and of plants respectively.

DISTRIBUTION OF ANIMALS

The distribution of living animals in space naturally forms the first division of our subject, both because the phenomena are simpler and better known, and because it puts before us the main problems and difficulties to the solution of which the other divisions furnish the key. Animals may be roughly divided into two great series, broadly distinguished as regards their mode of life—the terrestrial and the aquatic, and for the purpose of our present study these divisions are of primary importance, because that element which limits the range of the one class offers a free passage to the migrations of the other, and *vice versa*. The first series is by far the most important. It is the best known, and includes almost all the higher animals; while the variety and interest of the various land divisions of the globe are far greater than in the case of that portion of its surface covered by water. We shall therefore consider first, and with a greater amount of detail, the distribution of land animals, including among them the fresh-water forms whose range is limited by the same general conditions.

THE GEOGRAPHICAL DISTRIBUTION OF LAND ANIMALS.

As soon as we begin to examine into the distribution of animals over the land surface of the globe, we meet with two very distinct and sometimes conflicting classes of facts, which may be conveniently grouped as *climatal* and *geographical* distribution. The first is the most obvious, and was long considered to be the most essential, since we find that not only many species, as the polar bear and musk sheep, are strictly limited to cold countries, and others, as the tapir, to warm, but that entire groups, as the sheep on the one hand and the trogons on the other, seem almost equally dependent on temperature. But when we come to compare the productions of the several continents, we find a set of differences in which climate appears to play no part. Thus, almost the whole of the warblers (*Sylviidae*) of Europe and North Asia are absent in similar climates in North America, their place being taken by a totally distinct family, the wood-warblers (*Mniotiltidae*), the ant-eaters, sloths, and tapirs of tropical America are replaced in tropical Africa by aard-varks (*Orycteropus*), lemurs, and hippopotami, while islands like Borneo and New Guinea, situated in the same ocean not very far apart, and whose climates and physical conditions are, as nearly as possible, identical, are yet as radically different in their chief forms of animal life as are remote countries situated respectively in the cold and tropi-

cal zones. It is evident then, that although climate has a certain amount of influence on the distribution of animal forms, yet geographical conditions are far more important. There is reason to believe that the direct action of climate on animal life is far less effective than its indirect action through the limitation of the variety and quantity of vegetable and insect food, whereas geographical isolation has led to diversity of type by its influence on development during successive ages, as pointed out by Mr Darwin (*Origin of Species*, 6th ed. p. 81, 83.) It follows that zoological regions, or those primary divisions of the earth characterized by distinct assemblages of animals, will, for the most part, coincide with natural geographical divisions. They do not, however, conform to the actual divisions of our geographies, because these are often political or ethnographical, rather than physical—as in the separation of Europe from Asia. In another case, the coincidence of a mountain chain (the Himalayas) and the plateau of Thibet, with the demarcation of the tropical and temperate zones, forms a zoological division across a continent almost as complete as would be effected by a considerable extent of ocean.

Vertical Distribution of Animals.—Besides the horizontal distribution dependent on the various causes just indicated, the range of animals is more or less determined by the altitude of the land surface above, or its depth below the sea-level. As we ascend lofty mountains, the forms of life change in a manner somewhat analogous to the changes observed in passing from a warm to a cold country. This change is, however, far less observable in animals than in plants, and it is so unequal in its action, and can so frequently be traced to mere change of climate and deficiency of food, that it must rank as a phenomenon of secondary importance. Vertical distribution among animals will be found in most cases to affect species rather than generic or family groups, and to involve in each case a mass of local details which can hardly be introduced in a general sketch of the whole subject of distribution. The same remarks apply to the bathymetrical zones of marine life. Many groups are confined to tidal, or shallow, or deeper waters; but these differences of habit are hardly “geographical,” but involve details, suited rather to the special study of individual groups than to such a general outline of the distribution of the animal kingdom as we are here attempting to lay before our readers.

Powers of Dispersal of Animals.—Animals differ greatly in their powers of dispersal or migration, and this is an important element in determining the causes of their actual distribution. Mammalia as a class are more limited in this respect than birds, because the former have no means of passing over seas and oceans, or, with few exceptions, over lofty mountains or arid deserts, all of which when of moderate width can be easily traversed by many birds. Reptiles in their adult state are almost as restricted in their powers of dispersal as mammals, but most of them being oviparous, their eggs may be floated on drift wood over seas and straits, or even, in rare cases, be carried by birds; whereas the young of mammalia are for some time wholly dependent on their parents. Amphibia and fresh-water fishes have yet another advantage, that many of them can endure great cold, and their ova may sometimes be frozen without injury. Thus floating ice becomes an important agent in their dispersal, and enables us to account for the curious fact that their distribution often differs in a remarkable manner from that of the three higher classes of vertebrates. When we come to insects, we find the power of dispersal (as regards land animals) at a maximum, for not only can they travel by almost every mode available to other groups, but their small size, low specific gravity, and (in many cases) great tenacity of life, give them altogether

exceptional advantages in this respect. They are easily carried for great distances through the air by gales and storms; and there is evidence to show that many remote islands have been thus stocked, and that many wide-spread groups owe their extensive range to this cause. Others can float uninjured for many days at sea; while their eggs or larvae, inclosed in crevices of tree-trunks or concealed under bark, may be carried for hundreds or even thousands of miles by surface currents across extensive seas (Wallace, *Geographical Distribution of Animals*, vol. i. pp. 32, 209–214). The fact, then, that these small creatures have often a more extensive range, and present greater anomalies in their distribution, than larger animals, is only what we might expect; and if we keep their unusual powers of dispersal ever present to our minds, we shall be able to account for most of the anomalies they present, and thus bring them under the same general classification of the phenomena of distribution which is most serviceable in studying the history of the higher animals.

But the actual power of dispersal is by no means the only factor in determining the distribution of a species or a group. It is no use to bring a creature to a new country if it cannot live and maintain itself there. Whether it can do so depends upon many causes. It must be able to adapt itself to a different climate, and generally to different physical conditions; it must be able to live upon whatever food it may find in its new abode; and, most important of all, it must be able to defend itself against new kinds of enemies and to live in successful competition with allied organisms which are already in possession of the soil.

Wide-spread and Local Groups.—There is much reason to believe that the last-mentioned condition is the most difficult for an intruder to fulfil, and that a large proportion of the immigrants which from any cause arrive in a new country, are unable to maintain themselves in it, not because the country itself is not well adapted to their wants, but solely because it is already occupied by other creatures somewhat better adapted to all the surrounding conditions. Hence arise the phenomena of wide-spread or dominant species, and others which are exceedingly local and often rare, that is, consisting of but a small group of individuals. The former are best adapted to the entire environment, and are generally increasing their numbers and area of distribution; the latter are less perfectly adapted, and probably diminishing in numbers and on the road to final extinction. The power of adaptation seems, generally speaking, to be in an inverse ratio to the power of dispersal. The larger mammalia and many birds are capable of enduring a great variety of climates, and even of maintaining themselves in many new countries in competition with the native inhabitants. Thus horses and cattle from the Old World have run wild and greatly multiplied in both North and South America, and are probably capable of existing in any country where there is a sufficiency of open uncultivated land. Insects, on the other hand, are often dependent on some one kind of vegetable food, are especially liable to injuries by climate, and unless very numerous would be liable to be at once exterminated by their various enemies.

Barriers which Limit the Distribution of Animals.—These are of many kinds, and affect the several groups in unequal degrees. The nature of the vegetation alone determines the range of a number of animals. Deserts, marshes, open plains, and especially forests, have each their peculiar inhabitants which can hardly stray far beyond their limits. This is particularly the case with the tropical forests, whose perennial foliage and almost perennial succession of flowers and fruits supply the wants of an immense number of peculiar forms of life. These forests are, in fact, the home

of all that is most characteristic of the tropics, and their limits form the dividing lines between very distinct faunas. Rivers, when very large, also determine the range of many species, but this is probably because their valleys have been once arms of the sea separating districts with somewhat different faunas. Mountains, when rising to a great height in unbroken ranges, form an impassable barrier to many groups, but their geological age is also an important factor, and they are seldom so ancient and so continuous as to form absolute barriers. Climate, whether determined by latitude or by elevation above the sea, is also a very effective barrier, though probably its action is indirect, and is determined by its influence on vegetation, and by bringing diverse groups into competition. The limits of the tropical and temperate zones, generally marked out by more or less extensive deserts, form the boundary between regions or sub-regions all round the globe. Oceans are, however, by far the most important barriers; and thus is due not only to their great extent and general impassability to land animals, but also to their enormous antiquity, so that for countless ages they have separated the faunas of remote continents from each other.

In accordance with these principles, it is found, that continents separated by the widest and deepest oceans differ most radically in the entire series of their animals; while those which are less completely separated, or which are only divided by climatal differences or by mountain ranges, are less unlike in their chief forms of life. Thus are constituted zoological regions, which represent the most permanent geographical features of the globe, and afford us an indication of that permanence in the isolation and peculiarity of their animal inhabitants.

Zoological Regions.—Although there is some difference of opinion as to the number and limits of the primary divisions of the earth termed regions, the following are now generally admitted to be the most satisfactory. They are nearly identical with those first proposed by Mr P. L. Selater in 1857.

1 The Palearctic Region, which includes all Europe to the Azores and Iceland, all temperate Asia from the high Himalayas and west of the Indus, with Japan, and China from Ningpo and to the north of the watershed of the Yang-tse-kiang; also North Africa and Arabia, to about the line of the tropic of Cancer. This may be popularly called the European region, Europe being the richest and most varied portion of it and containing representatives of all the more important types; but it must not be forgotten that the region includes a much larger area in Asia, and that there are many peculiar North Asiatic animals.

2 The Ethiopian Region, which includes all Africa south of the tropic of Cancer, as well as the southern part of Arabia, with Madagascar and the adjacent islands. It may be popularly termed the African region.

3 The Oriental region, which is comparatively small, including India and Ceylon, the Indo-Chinese countries and southern China, and the Malay Archipelago as far as the Philippines, Borneo, and Java. It may be popularly called the South Asiatic or Indian region.

4 The Australian Region, which is composed of the remainder of the Malay Archipelago, Australia, New Zealand, and all the tropical islands of the Pacific, as far east as the Marquesas and the Low Archipelago.

5 The Neotropical Region, which comprises the whole of South America and the adjacent islands, the West Indies or Antilles, and the tropical parts of Central America and Mexico. It may be well called the South American region.

6. The Nearctic region, which consists of all temperate and arctic North America, with Greenland, and is thus well described as the North American region.

These six regions, although all of primary importance from their extent, and well marked by their total assemblage of animal forms, vary greatly in their zoological richness, their degree of isolation, and their relationship to each other. The Australian region is the most peculiar and the most isolated, but it is comparatively small, and poor in the higher animals. The Neotropical region comes next in

peculiarity and isolation, but it is extensive and excessively rich in all forms of life. The Ethiopian and Oriental regions are also very rich, but they have much in common. The Palearctic and Nearctic regions, being wholly temperate, are less rich, and they too have many resemblances to each other; but while the Nearctic region has many groups in common with the Neotropical, the Palearctic is closely connected with the Oriental and Ethiopian regions. The cause of these various resemblances and differences depends on the past history of the earth, and will be better understood when we have sketched the zoological features of each region and the changes they have undergone in the latest geological periods.

I. The Palearctic Region.—This extensive region, though varied in physical aspect, and often covered with luxuriant vegetation, is poor in animal life when compared with the great tropical regions of the Old and New Worlds. This is no doubt due mainly to climate, but also in part to so much of its surface being densely populated and highly cultivated. It contains, however, a number of characteristic and not a few altogether peculiar animal forms. Beginning with the Mammalia, we have first the sheep and goats with such allied forms as the chamois and saiga-antelope, which are especially characteristic, deer are abundant and varied, the smaller cats, the wolves, the foxes, and the bears abound, with a variety of smaller groups, as weasels, badgers, and some others. Seals are plentiful on the northern coast, and even in the Black and Caspian Seas; wild horses and asses abound in Asia, as they once did in Europe, there are many peculiar forms of mice, voles, and hamsters, while dormice, squirrels, marmots, hares, and pikas are well-marked features of the region. The insectivorous family of the moles is almost peculiar, as are the curious mole-rats (*Spalax*). The genera which are peculiar to the Palearctic region belong to the following families.—to the moles (*Talpidae*) 7 genera; to the dogs (*Canidae*) 1 genus; to the weasels (*Mustelidae*) 3 genera; to the pandas (*Ailuroidae*) 1 genus, to the seals (*Phocidae*) 1 genus; to the camels (*Camelidae*) 1 genus, to the deer (*Cervidae*) 6 genera, to the hollow-horned ruminants (*Bovidae*) 7 genera; to the rats (*Muridae*) 6 genera; to the mole-rats (*Spalacidae*) 2 genera, to the *Octodontidae*, a peculiar group of rat-like animals only found in South America, Abyssinia, and North Africa, 1 genus.

In birds, the Palearctic region is pre-eminently rich in thrushes, warblers, titmice, jays and magpies, sparrows, and buntings. It also abounds in grouse, and in its eastern half in magnificent pheasants. Water-birds are plentiful, and its northern districts produce many fine ducks and divers. The following enumeration of the families of which the Palearctic region possesses peculiar genera will help to give an idea of the characteristic features of its ornithology.—Of the warblers (*Sylviidae*) 15 genera, many of which, however, migrate into tropical Africa and India in winter; of babblers (*Timaliidae*) 1 genus, of reedings (*Panuridae*) 4 genera, of creepers (*Certhiidae*) 1 genus; of tits (*Paridae*) 1 genus; of the crow family (*Corvidae*) 4 genera, of finches and buntings (*Fringillidae*) 12 genera; of starlings (*Sturnidae*) 1 genus, of larks (*Alaudidae*) 2 genera; of sand-grouse (*Pteroclididae*) 1 genus; of grouse (*Tetraonidae*) 4 genera; of pheasants (*Phasianidae*) 5 genera; of vultures (*Falconidae*) 1 genus, of rails (*Rallidae*) 1 genus; of snipes (*Scolopacidae*) 4 genera, of coursers (*Glareolidae*) 1 genus; of bustards (*Otididae*) 1 genus.

Of the remaining groups less accurate information is obtainable, and their distribution is less generally interesting. Reptiles, being heat-loving animals, are comparatively scarce, yet in the desert regions they are more plentiful and furnish a considerable number of peculiar types, there

being two genera of snakes and four of lizards not found in any other region. All reptiles diminish rapidly as we go north, and cease before we reach the Arctic circle. The common viper reaches 67° N. lat. in Scandinavia, the northern limit of reptiles in the region. Amphibia are much more patient of cold, the common frog ranging to the extreme north of Europe. There are no less than 16 peculiar genera of Amphibia, 8 of the tailed and 8 of the tailless group, the most remarkable being the *Proteus*, found only in subterranean lakes in Carniola and Carinthia.

Of fresh-water fishes about 20 genera are wholly confined to the region, of which the perches (*Percidæ*) have 3 genera; the salmon and trout (*Salmonidæ*) 3 genera; the carp (*Cyprinidæ*) 13 genera; with a peculiar genus and family (*Comephorus*) found in Lake Baikal, and another (*Tellia*) belonging to the *Cyprinodontidæ*, in the Atlas Mountains.

Insects are so extensive a class that the barest enumeration of their most remarkable forms would be out of place in such a sketch as this. We can only mention that, although butterflies are not very numerous, yet no less than 15 genera are peculiar to the region. Beetles, however, abound, and the most characteristic Palearctic group is undoubtedly the *Carabidæ*, or predaceous ground-beetles, which are more predominant here than in any other region, and are also of larger average size—a most unusual circumstance in the insects of a temperate as compared with those of tropical regions.

Land shells are tolerably numerous both in species and individuals, but are of small size and little beauty as compared with those of warmer countries. Very few of the genera are peculiar.

The total number of the generic forms of Vertebrata peculiar to the Palearctic region is, as nearly as can be estimated, 138,—a very large number when we consider the general severity of the winter, and the circumstance that along its whole southern margin this region is bounded by tropical lands with no absolute barrier against intermigration. The amount of peculiarity may be even better estimated by the fact that, out of a total of 274 genera of Mammalia and birds inhabiting the region, 87, or somewhat less than one-third, are confined to it. This mode of estimating the zoological character of a region by *genera*, gives a far truer idea than any enumeration of peculiar *species*, because the former imply more radical and important differences than the latter.

Subdivisions of the Palearctic Region.—The general zoological characters here given apply with considerable uniformity to the whole of the Palearctic region, the similarities being of course greater where climate and physical conditions generally correspond. Thus, even between such remote islands as Great Britain and Yesso (North Japan) there is a wonderful similarity in the general forms of life, many of our most familiar birds and insects reappearing at the other extremity of the region under identical or but slightly modified forms. Owing perhaps to the great climatal changes the north temperate zone has undergone in recent geological times, and the vast amount of migration thereby produced, as well as to the absence of any continuous barriers, it is very difficult to mark out with accuracy the zoological subdivisions of this region. Certain broad divisions, depending partly on climate, partly on physical features, and partly on geographical proximity to other regions, may, however, be indicated.

Europe, north of the Pyrenees, Alps, Balkans, and Caucasus, may perhaps be considered as the most typical portion of the Palearctic region, possessing most of its characteristic features in their full development. It may be termed the European sub-region. South of this comes the Mediterranean sub-region, including South Europe and North Africa, which wonderfully resemble each other in all their chief forms of animal life, although some few purely African species are found south of the Mediterranean. This sub-region includes also Asia Minor and Persia, with Syria and Northern Arabia. It is chiefly characterized by a number of desert forms, such as gazelles, civets, jerboas, quails, desert-larks, and numerous lizards, and by a number of species which cannot endure the colder climate of the north, as porcupines, monkeys, ichneumons,

and a host of peculiar groups of insects. To this region belong the Atlantic islands from the Azores to the Canaries, the animal productions of all of them being closely related to those of South Europe or North Africa. It is a curious fact that the remotest of these islands, the Azores, offer less peculiarity in their birds and insects than Madeira and the Canaries, which are so much nearer the continent, but this is sufficiently explained by the greater prevalence of storms and gales in the more northern latitude of the Azores, and helps to prove that aerial currents are the chief means by which these two classes of animals are dispersed. For a discussion of this interesting subject and its bearing on the theories of distribution and development, see Wallace, *Geographical Distribution of Animals*, vol. i. p. 206.

The northern part of Asia differs very little in the main features of its zoology from the corresponding parts of Europe, but as we approach the northern slopes of the great plateau of Central Asia many peculiar forms occur, as wild horse, pikas (*Lagomys*), starlings of the genus *Podiceps*, and many others. The great desert plateaus of Thibet and Mongolia form another subdivision, with many peculiar forms. Here are found the yak, some peculiar antelopes, with wild sheep and goats, and several peculiar rodents, and among birds many peculiar forms of grouse, partridges, and pheasants.

Another well-marked division is formed by the temperate portion of Eastern Asia, comprising Japan, Manchuria, Northern and Central China, with parts of East Thibet and the higher portions of the Himalayas as far west as Nepal. This is a fertile and luxuriant district which receives several tropical forms of life from the adjoining Oriental region. It is rich in insectivora and in deer, the deer-like musk being confined to it, it has a peculiar form of wild-dog (*Nyctercutis*), and even several peculiar species of the monkey tribe. It is also pre-eminently the home of the pheasant tribe, such magnificent birds as the golden, silver, and Reeves' pheasants being peculiar to it. It has also a number of showy jays, finches, tits, and warblers; and its insects present a number of fine tropical-looking species. The Manchurian sub-region has thus a very beautiful and varied fauna, but the intermingling of Oriental types, and the uncertainty of its southern boundary, render it less characteristically Palearctic than the European sub-region.

II. *The Ethiopian Region*.—This region is much less extensive than the last, but being almost wholly tropical it presents a richer and more varied assemblage of animals. Its southern extremity, although really extra-tropical, is yet so warm and so little subject to extremes of temperature that the growth of vegetation and the corresponding development of animal life are scarcely diminished, and the same may be said of the elevated interior of the continent. As Madagascar is quite isolated and its productions very peculiar, it will be best first to sketch the main features of African zoology, which are tolerably well marked and homogeneous.

The African continent is pre-eminently the country of large Mammalia. It possesses an abundance of elephants, rhinoceroses of several species, giraffes (now peculiar to it), gorillas and baboons—the largest of the ape tribe, a host of large and remarkable antelopes, the huge hippopotamus, several species of zebras, wild buffaloes, several remarkable forms of swine, and an abundance of lions, leopards, and hyenas,—forming together an assemblage of large and highly organized animals such as occur nowhere else upon the globe. There are also many smaller, but very remarkable forms. There are 7 peculiar genera of apes, 3 of lemurs, 5 of *Insectivora*, 12 of *Viverridæ*, the remarkable *Proteles* forming a distinct family allied to hyenas and weasels, 2 of *Canidæ*, 2 of *Mustelidæ*, 2 of *Suidæ*, 1 of *Tragulidæ*, 12 of *Bovidæ* (antelopes), 18 of various families of Rodents, and the curious aardvark (*Orycteropus*), forming a distinct family of *Edentata*.

In birds Africa is not so peculiar, yet it has many remarkable groups. Such are the plantain-eaters (*Muscophagidæ*), the colics (*Coliidae*), the secretary-birds (*Serpentariidæ*), the ground horn-bills, and the guinea-fowl,—all of which are peculiar. It abounds also in peculiar flycatchers, shrikes, sun-birds, weaver-birds, starlings, larks, barbets, grouse, and hawks,—more than half the genera of land-birds being peculiar, and, if we include those of Madagascar, nearly two thirds.

Reptiles abound, there being three peculiar families of snakes and one of lizards: and there is one peculiar family

of toads. There are also three peculiar families of freshwater fishes.

It is impossible to give any idea of the special features presented by the insects and land-shells without going into details which would be out of place in such a sketch as we are here giving. In both these groups Africa is fully as rich as the other tropical regions, and exhibits perhaps more peculiar features than among the higher animals.

We must, however, just mention the remarkable absence from the Ethiopian region of certain groups of Mammalia which abound in the countries to the north and east of it, as this phenomenon has an important bearing on the probable origin of the fauna. The most striking of these deficiencies are the two families of the deer and the bears, which abound over the whole northern hemisphere, in tropical Asia and the Malay islands, and even in North Africa, but are both entirely unknown over the whole Ethiopian region, as are, among smaller groups, the goats and sheep, the true oxen, and the mulo family. Among birds such wide spread groups as the wrens (*Troglodytidae*), dipper (*Cinclus*), and the true pheasants are also entirely wanting.

The exceeding speciality of the forms of life which are still found in the Ethiopian region is well shown by the fact that there are about 21 family groups of vertebrate animals which are entirely confined to it, while two thirds of its genera of Mammalia, and three-fifths of the genera of birds, are also peculiar.

Solitary islands of the Indian Ocean.—The most remarkable of these is undoubtedly that comprising Madagascar and the Mascarene islands, a district which contains so many singular forms of life that it has been proposed by some naturalists to make it one of the primary zoological regions. The peculiarity of these islands is twofold, consisting as much in the absence of a great number of the most characteristic African forms as in the possession of others entirely peculiar. The apes and monkeys, the large Carnivora, the rhinos, giraffes, antelopes, elephants, and rhinoceroses, and even such smaller forms as the porcupines and squirrels, are entirely wanting. Yet Madagascar possesses a host of remarkable *Lemnidae*, consisting of 7 genera and 35 species, all of which are peculiar, a peculiar family of *Insectivora*, comprising 5 genera and 10 species, a peculiar family and 5 peculiar genera of small *Carnivora*; and 3 peculiar genera of *Martidae*. Even among birds, so much better able to traverse a narrow sea, there are some curious deficiencies, the families of woodpeckers (*Picidae*), honey-guides (*Indicatoridae*), barbets (*Momotidae*), plantain-eaters (*Micropodidae*), rollers (*Coliidae*), hornbills (*Bucconidae*), and mockers (*Artamusidae*)—all abundant on the opposite coast of Africa—being entirely wanting. Yet birds are sufficiently abundant, nearly 120 species of true land-birds being known, while there are no less than 33 genera which are altogether confined to Madagascar and the Mascarene islands. If we consider the species, the peculiarity is even more remarkable, there being more than a hundred which are peculiar to about a dozen which are found elsewhere. These numbers, however, by no means fully represent the special character of the Mascarene bird-fauna, which consists in the anomalous character of many of the genera, so that it is to this day a matter of dispute among ornithologists in what families a considerable number of them should be classed. Among these anomalous genera are *Meotus*, *Tylas*, *Arctopus*, *Cathartus*, *Eurostus*, *Phalacrocorax*, *Leptocorax*, *Atalapha*, and several others. Taking all these facts into consideration, we arrive at the conclusion that the fauna of Madagascar is more peculiar than that of any other single island on the globe.

The reptiles of Madagascar are less known, but they exhibit some remarkable peculiarities. Many African groups are wanting, others are represented by peculiar genera, while a considerable number of groups have their nearest allies, not in Africa, but in tropical Asia and in South America. Among insects the butterflies are allied to those of Africa; but the beetles, like the reptiles, show many cases of affinity with the Malay islands and South America, though the majority are perhaps related to true Ethiopian forms.

The continental part of the Ethiopian region appears to have no subdivisions clearly marked out by natural barriers, yet it may be divided into three tolerably well-defined sub-regions in accordance with differences of climate and vegetation. These may be termed the sub-region of open plains, the forest sub-region, and the south temperate sub-region.

The first comprises the greater part of Central and East Africa,

and a northern belt from Senegambia through Lake Chad to Abyssinia, while it extends to the Atlantic coast from Angola to Danara Land. This extensive district may doubtless be further subdivided, but it exhibits throughout the main features of Central African zoology as distinct from that of West and South Africa. Its zoological characters are negative rather than positive, as it has very few peculiar groups, but all the great African Mammalia abound, and a greater variety of antelopes are found here than in the other sub-regions.

The West African or forest sub-region extends from the Gambia to the Congo, and inland to the sources of the Nile and the western watershed of the great lakes. It is characterized generally by a luxuriant forest-vegetation, and it possesses many peculiar animal forms. Here we find the gorilla and chimpanzee, a great variety of monkeys, and two peculiar genera of lemurs, as well as some remarkable genera of *Insectivora*, *Viverridae*, and *Tragulidae*. It is the home of the gray parrots (*Psittacus*), the typical plantain-eaters (*Micropodidae*), one of the Eastern group of ground thrushes (*Pitta*), and many peculiar genera of passerine birds. Reptiles are very abundant, no less than 13 genera of snakes and 3 of lizards being peculiar to this sub-region. As is always the case in tropical forest-districts, insects are especially numerous, of large size and brilliant colours.

The South African or extra-tropical sub-region, though quite open to the central districts and to a large extent overrun with the same fauna, yet presents so many peculiarities as to indicate, probably, a former southward extension of the continent. We find here 3 peculiar genera of *Viverridae*, the remarkable *Proteles*, peculiar *Canidae* and *Mustelidae*, many peculiar rodents, including *Rattus* (one of the mole-rats), *Putorius* (one of the spiny-rats), and *Pedetes* (the Cape-hare). There are also some peculiar genera of birds, among which are a sun-bird, 2 weaver-birds, 3 larks, and a curious woodpecker (*Geocolaptes*). Reptiles are still more peculiar, 4 genera of snakes and 10 of lizards being almost or quite restricted to this limited district. Insects, too, are very remarkable, there being 7 peculiar genera of butterflies, and a host of beetles which are either quite peculiar or have their nearest allies in Madagascar, in India, or America. This remarkable and isolated fauna must be considered, in connection with the wonderful Cape flora—so much richer and more isolated than that of any other part of Africa—as indicating important changes in the past history of this part of the globe.

III. *The Oriental Region.*—The Oriental region is wholly tropical, but is of smaller extent than the Ethiopian. It is very largely covered with forest-vegetation, and is much broken up into islands and promontories, conditions so favourable to animal life as fully to compensate for its smaller area.

In the larger Mammalia there are many resemblances between the Oriental and Ethiopian regions. Both have anthropoid apes, elephants, rhinoceroses, large felines, buffaloes, and an abundance of civets. But the Oriental region abounds in deer and bears, it has many remarkable *Insectivora*, the Malay tapir, and many wild cattle. It has also a great number of characteristic forms of life. It has 6 peculiar genera of apes, and 3 of lemurs, 5 of *Insectivora*, among which are two peculiar families, *Galeopithecidae* and *Tupaia*; 12 of *Viverridae*, 1 one of *Canidae*, 5 of *Mustelidae*, 2 of *Ursidae*, 1 of *Tragulidae*, 1 of *Cervidae*, 4 of *Bovidae*, and 5 of *Rodents*.

The birds of this region are exceedingly abundant, varied, and remarkable. Among them are 3 peculiar families of passerine birds—the lull-tits (*Liotrichidae*), the green bulbuls (*Phyllornithidae*), and the gapers (*Eurylemidae*), while the babblers (*Timalidae*), the fruit-thrushes (*Pycnonotidae*), and the king-crows (*Dicruridae*) are far more abundant than in the adjacent regions. Tits, flycatchers, crows, sun-birds, starlings, kingfishers, pigeons, and pheasants are also very abundant, and are represented by many remarkable forms. More than 340 genera of land-birds inhabit the region, of which number 165 are peculiar to it. Reptiles are very abundant. Three small families of snakes are peculiar, and there are a large number of peculiar genera both of snakes and lizards.

Insects are exceedingly varied and beautiful, especially in the Himalayas and in the Malay islands. Among butterflies the *Danaidae* are very abundant, while the true *Papilio*s are perhaps finer than in any other part of the

world Among beetles the *Lucanidae*, *Cetoniidae*, and *Buprestidae* are especially remarkable, while the elegant Longicorns have their full quota of curious and beautiful forms

Subdivisions of the Oriental Region—These are tolerably well marked, though very unequal in extent and productiveness. The Himalayan slopes with all the Indo-Chinese countries form the chief and most typical part of the region. Here are the greatest variety of Mammalia and birds, and almost all the more important groups are represented. Three genera of Mammalia and 44 of birds are peculiar to this sub-region.

The Malay Peninsula, with the larger Malay islands, as far as Java, Borneo, and the Philippines, form a sub-region which has much in common with the last, and is almost equally rich, and in some groups even richer and more peculiar. Thus it has no less than 14 genera of Mammalia and more than 40 genera of birds which are wholly peculiar to it, among which are such interesting forms as the orang-utans (*Sima*), the spectre-lemur (*Tarsius*), the flying-lemur (*Galeopithecus*), the feather-tailed rat (*Philocerus*), the sun-bear (*Helarctos*), and the magnificent argus-pheasants (*Argusianus*). About an equal number of genera are common to the Malayan and the Indo-Chinese sub-regions, but are not found elsewhere, so that the two have much in common, and together comprise nearly all that is most remarkable and beautiful of the Oriental fauna.

The other two sub-regions consist of the peninsula of India and Ceylon, whose chief feature is their comparative zoological poverty. Taking first what may be termed the Indian sub-region, extending from the foot of the Himalayas to the Carnatic, we find that this extensive and fertile region, though abounding in life of every kind, yet possesses no peculiar genus of either Mammalia or birds, while, favoured by the open and arid plains of which much of the surface consists, some African types are more abundant than in other parts of the region, though these are numerically unimportant.

Ceylon and Southern India are somewhat more interesting, as they possess some peculiar forms, and others in common with the Malay islands. Among the former is *Loris*, a peculiar lemur; and there is a peculiar genus of *Murida*, as well as one or two peculiar genera of birds. There are also several peculiar species of monkeys, and the Malayan genus *Tupaia*, while among birds we find Malayan forms of cuckoos and *Timalidae*. The reptiles, however, best characterize this sub-region, as it possesses an entirely peculiar family of snakes (*Uropeltidae*), consisting of 5 genera and 18 species, as well as 4 other peculiar genera of snakes. There are also many peculiar genera of lizards belonging to the *Agamidae* and *Acontidae*, and 3 peculiar genera of tailless Batrachia. The insects also offer some remarkable cases of Malayan affinity, the genus *Hestia* (or spectre-butterflies) being found in Ceylon only beyond the Malay islands, while 6 genera of Malayan Longicorns and the wingless *Tricordylia* belonging to the *Cicadellidae*, are in the same category. The combination of so many peculiarities justifies the separation of Ceylon and a portion of Southern India as a distinct Oriental sub-region.

IV *The Australian Region*—On entering this region we meet with such a radical change in all the higher forms of life, that the zoologist seems to have got into a new world. Even the Austro-Malay islands, though differing in no way in climate or luxuriance of vegetation from the Indo-Malay islands to the west of them, exhibit this change in an almost equally marked degree. With the exception of Celebes, which is a debatable land hardly belonging to either region, the other islands only possess a few deer and pigs to represent the host of varied Mammalia—from the elephant and tapir to the squirrel and monkey—which characterize every part of the Oriental region to its extreme south-eastern limits in Java and Borneo. In place of these we have Marsupials only, in great variety in the extensive country of Australia and less abundantly in the islands; and besides these, only those flying mammals—the bats, which can traverse the ocean, and the smallest forms of rodents, the mice—which may be occasionally carried by floating trees or other accidental means across narrow arms of the sea. There are 5 distinct families and 33 genera of Australian Marsupials, as well as 2 families and genera of the still more lowly-organized Monotremata which comprise the anomalous *Ornithorhynchus* and *Echidna*.

Birds, as might be expected, are not so excessively peculiar, a large number of almost cosmopolitan families extending into Australia, yet there are no less than 16 families altogether characteristic of the region, among which

are such remarkable forms as the Paradise-birds (*Paradisæidae*), the honey-suckers (*Meliphagidae*), the lyre-birds (*Menuridae*), the cockatoos (*Cacatuidæ*), the lorries (*Trichoglossidae*), the mound-builders (*Megapodidae*), and the cassowaries (*Casuaridae*). Among the important groups which are entirely wanting in Australia are the barbets (*Megaluridae*), the woodpeckers (*Picidae*, otherwise cosmopolitan), the trogons (*Trogonidae*), and the pheasants (*Phasianidae*). The reptiles, as in most other cases, offer less marked peculiarities than the birds; but a large proportion of the genera are peculiar, and there are even 3 peculiar families of lizards, as well as the singular *Hatteria* of New Zealand, which constitutes not only a separate family but a new order of reptiles. The Amphibia and fresh-water fishes present a corresponding amount of peculiarity; and the recent discovery of the genus *Ceratodus* (the mud-fish) is very interesting, since its nearest allies appear to have lived early in the Secondary period, while other members of the same group are found isolated in the rivers of tropical Africa and America.

Insects are very abundant in Australia and the Austro-Malay islands; but owing to the various means by which these small creatures are conveyed across the seas, and the identity of physical conditions in the Oriental and Australian portions of the archipelago, the true Australian fauna is chiefly developed in Australia itself, where there are a considerable number of peculiar genera in all orders of insects.

Subdivisions of the Australian Region—Besides the Australian continent, which is by far the richest and most important part of the region, there are three groups of islands which have each some distinctive peculiarities. These are the Austro-Malay islands, comprising New Guinea, the Moluccas, and the Timor group; the Pacific islands, and the New Zealand group. The first is very rich, especially in birds and insects while the other two are exceedingly poor.

The Austro-Malayan sub-region, of which New Guinea is the central mass, is comparatively poor in Mammalia, only 9 genera of marsupials being yet known, 6 of them being peculiar, with pigs, a few mice, and some deer (perhaps introduced) in the Moluccas. Birds are far more numerous, the Paradise birds and the true crimson lorries being peculiar to the sub-region, while more than 40 genera of land-birds are confined to it. It is exceptionally rich in peculiar forms of flycatchers, honey-suckers, kingfishers, cockatoos, and pigeons, and its birds are generally characterized by a brilliancy of plumage far exceeding that which prevails in the surrounding regions. The insects exhibit a similar brilliancy, some of the finest butterflies and beetles in the world belonging to this sub-region.

Directly we pass east of the Solomon Islands we enter upon one of the poorest zoological regions in the world in proportion to its extent and luxuriant vegetation, the only exception to this poverty being in the land-shells, which are very largely developed and very peculiar. Indigenous Mammalia are wholly wanting. Birds are very scarce, no more than about 150 species being known from the numerous islands scattered over 5000 miles of the Pacific, while there are only about a dozen peculiar genera. Reptiles are more numerous than might be expected, considering the wide extent of ocean separating many of the islands. There are 14 genera of lizards, of which 6 are peculiar, but few extend eastward of the Samoa Islands. Snakes are much less abundant, and none are found east of the Fiji Islands. Insects are exceedingly scarce, and of little interest.

The New Zealand group, though situated beyond the tropics and very remote from other lands, yet possesses a more ample and more interesting fauna. If we except two bats, mammals are wanting; but birds are tolerably abundant, and are very peculiar and interesting. There are 34 genera of land-birds, of which 16 are peculiar. Twelve of these are passerine birds, chiefly *Meliphagidae* and *Sturnidae*, with *Nestor* and *Stringops*, peculiar genera of parrots, and the extraordinary wingless *Apteryx*. Reptiles are few. There are a few lizards, with one peculiar genus, but no snakes. The anomalous *Hatteria* has been already mentioned. There is also one frog belonging to a peculiar genus. There are some interesting fresh-water fishes, one genus belonging to the *Salmonidae*, a family not occurring elsewhere in the southern hemisphere; and there are several species allied to South American fishes.

Insects are very few, and generally of small size and inconspicuous colours. Many of them are peculiar, but they have mostly affinities with Australian groups, or with those from the Oriental region.

V. *The Neotropical Region*—This is in some respects the richest zoological region on the globe, yet it has certain resemblances to the Australian region, which is the poorest, and which it follows in natural order. This is owing to both being inhabited mainly by low types of Mammalia and birds, some of which have been preserved from early geological times, the Marsupials being a good example. But there has also been some intermigration between south temperate America and Australia, by means of intermediate islands and floating ice, and this has led to a community of forms in a few groups to which such a mode of transmission was possible.

The Mammalia are as abundant and varied as in any other countries except Africa and tropical Asia; but the region is characterized by poverty in the more highly organized forms, with a corresponding abundance of lower types. Monkeys are abundant, but all belong to two peculiar families—*Cebidæ* and *Haplidæ*—different in structure and of a somewhat lower organization than those of the Old World. About half of them have powerfully prehensile tails, a character unknown among the monkeys of the eastern hemisphere. Bats are very numerous, and one extensive family—the *Phyllostomidæ*, or vampyrobats—is peculiar. Insectivora are unknown in South America, but one peculiar genus occurs in the larger Antilles, and a few shrews in Central America. The Carnivora are but moderately numerous, the *Civet* family being entirely wanting, as are the bears, with the exception of a solitary species in Chili. There is, however, one peculiar family—the *Procyonidæ*—which extends over North America as well. A marked feature is the excessive scarcity of the great family of the Ungulata, or hoofed animals. There are no wild cattle, sheep, goats, antelopes, horses, or rhinoceroses, and only a very few species of tapirs, peccaries, llamas, and deer in their place. Coming to the small and feeble Rodents, however, we find a great abundance and variety of forms, including the largest on the globe. Five families are peculiar or nearly so,—the chinchillas and the cavies being the most important, while all the genera, except *Sciurus* and *Lepus*, are peculiar to the American continent. We now come to the Edentata, the most imperfectly organized and the most characteristic of the Neotropical mammals. There are twelve genera belonging to the three families of the sloths (*Bradypodidæ*), the armadillos (*Dasypodidæ*), and the anteaters (*Myrmecophagidæ*). Lastly, we have the Marsupial opossums, which range far over temperate North America, but are most abundant in the tropical regions of South America.

In birds the Neotropical region is wonderfully rich. It possesses far more distinct genera and species than any other region, and it has 24 entire families peculiar to it, while the region which comes next in speciality and isolation as regards this order—the Australian—has only 16. Most of these peculiar families are, however, of a somewhat low grade of organization, and it is these which abound most in genera and species and give a special feature to the ornithology of the country. These peculiarly American families (for some of them range into North America) are the tyrant fly-catchers (*Tyrannidæ*), the manakins (*Pipridæ*), the chatterers (*Cotingidæ*), the plant-cutters (*Phytotomidæ*), the tree-creeper (*Dendrocolaptidæ*), the ant-thrushes (*Formicariidæ*), and the wren-thrushes (*Pteroptochidæ*). All these have a deficiency in the singing-muscles of the throat, and they comprise more than 200 genera. Then, among the *Picariæ*, which are a low though wide-spread order, we have the toucans (*Rhamphastidæ*), the puff-birds (*Bucconidæ*), the jacamars (*Galbulidæ*), the motmots (*Momotidæ*), and the humming-birds (*Trochilidæ*), comprising 140 genera. The only

peculiar families of high organization are the sugar-birds (*Cærebidæ*), the greenlets (*Vireonidæ*), the hang-nests (*Icteridæ*), and the tanagers (*Tanagridæ*), comprising in all 82 genera. The most highly organized groups of birds, and those which are most abundant in the eastern hemisphere, such as crows, starlings, thrushes, warblers, and flycatchers, are either scarce or entirely wanting. Finches are numerous, as are parrots. Among game-birds the higher types, as the grouse (*Tetraonidæ*), are scarce, while the more lowly-organized curassows (*Cracidæ*) and tinamous (*Tinamidæ*) are much more abundant and more widely distributed over the whole region. Among the wading groups (*Grallæ*), which are decidedly of low organization, there are 6 peculiar and very isolated families, the most remarkable being the *Caramidæ*, the *Psophidæ* (trumpeters), the *Eurypygidæ* (sun-bitterns), and the *Palamedidæ* (horned-screamers). The very low struthious type is represented by the American ostriches (*Rhea*).

Reptiles are also very abundant in the Neotropical region, and there are many peculiar groups. Snakes are represented by peculiar genera only, the families being almost always widely and often universally distributed in warm regions; lizards are more restricted in their range, and no less than 5 families are peculiar to the region, while 9 are found only in the American continent. All are of very small extent except two, the *Teiidæ* and *Iguanidæ*, which are very numerous, and comprise the most characteristic American lizards. There are also 4 peculiar families of tailless Batrachians, the most popularly known being the *Pipidæ*, which contains the remarkable Surinam toad.

Fresh-water fishes are probably more abundant and varied than in any other region. Three entire families and several sub-family groups are peculiar, and the enormous forest-bordered rivers and extensive tracts of annually flooded woodland have led to the development of special groups of fruit-eating fishes, which, as articles of food, are not only unsurpassed but altogether unequalled in any other part of the globe. Fresh-water rays (*Trygonidæ*) and electric eels (*Gymnotidæ*) are also peculiar to Neotropical rivers, and there are an immense variety of *Siluridæ*, *Characidæ*, and *Cyprinodontidæ*. It is reported that Professor Agassiz obtained more than a thousand species of fishes in the Amazon alone; but, although this may be exaggeration, there is no doubt that a still greater number exists in that wonderful river and its tributaries.

The insects of tropical America are so inexhaustible in their variety, and so wonderful in their beauty, that it is hopeless to attempt to give an adequate idea of them. The butterflies are far more abundant and more gorgeous than in any other region, and their variety may be imagined from the fact that the peculiar genera are nearly equal in number to those of the rest of the world. The beetles, though very abundant, are not so clearly preponderant over those of all other regions. The stag-beetles (*Lucanidæ*) and resin-chafers (*Cetoundæ*) are somewhat peculiarly developed; but all the other large families are very abundant, and comprise many forms of extreme beauty and interest. Such are the genera *Agra* among Carabidæ, *Pyrodes* among Longicorns, and *Eutimus* among Curculionidæ. Land-shells equally surpass those of all other regions, but this is owing to the exceptional richness of the West Indian islands, the continent of America being by no means extraordinarily rich in this class of animals.

Subdivisions of the Neotropical Region—The manner in which this region may be most naturally and conveniently divided for zoological purposes is doubtful. Almost the whole of tropical South America (excluding only the higher Andes south of Chumborazo and the dry plain to the west) forms a compact area in which all the more characteristic Neotropical animal groups are developed in their highest luxuriance. This, however, falls natu-

rally into three subdivisions, which may be generally indicated as Guiana, Brazil, and the Eastern Andes, each of which is characterized by a great number of peculiar generic types. These three areas are considered by Professor Newton (in his article Birds in this work) to be sub-regions, each equivalent to the whole of south temperate America, and to the tropical part of North America, which may be termed the Mexican sub-region. But each of these latter may be also divided. South temperate America consists of a western and an eastern division, each with many distinct groups, while the southern parts of Central America differ greatly from the northern; and all these subdivisions may be considered as provinces of their respective sub-regions. It seems better, therefore, for the purposes of such a general sketch as the present, to consider the tropical parts of South America, as above limited, to be one great sub-region, characterized by possessing a large proportion of the animal forms of the whole region. It will therefore only be necessary to indicate in what way the other sub-regions differ from this.

The Chilian sub-region, or temperate South America as above defined, is well characterized by its exclusive possession of the family of the *Chinchillidae* (comprising three genera) and the genus *Auchenia* (the llamas and alpacas), the only representatives of the *Camelidae* in the New World. It also has a peculiar form of bear, several peculiar genera of rodents, and two peculiar forms of armadillos. Among birds it has the curious plant-eaters (*Phytoloma*), a peculiar family of waders (*Thalassidroma*), about 25 peculiar genera of passerine birds—1 of parrots, 2 of pigeons, and 2 of tinamous. It also possesses the American ostriches (*Elea*), and 3 peculiar genera of plovers. The reptiles are usually of tropical genera, but a few are peculiar. Many of the fresh-water fishes are of peculiar genera, but there are some Australian forms, and even one species (*Galaxias attenuatus*) is common to New Zealand, Tasmania, and Patagonia.

Among insects alone we meet with indications of a decided affinity for forms of the north temperate zone. There are several butterflies allied to *Erebia*, an Arctic genus, and others belonging to the northern genera *Hipparchia*, *Argynnis*, and *Celaia*. The mass of the butterflies, however, are purely Neotropical. Of the beetles some are Australian, but the majority are allied to Neotropical forms, yet among the *Carabidae*, or carnivorous ground-beetles, there are many truly northern genera, such as *Carabus*, *Anchomenus*, *Trechus*, &c., whose presence supports the theory of a migration along the Andes from the northern hemisphere. (See Wallace's *Geographical Distribution of Animals*, vol. ii. pp. 44-45.)

In tropical North America, or the Mexican sub-region, we find far less peculiarity. The southern portion from Panama to Nicaragua can hardly be separated zoologically from the adjacent parts of South America, while further north the chief difference consists in the absence of many typical Neotropical groups, and the appearance of a few which more especially characterize the Nearctic region. A peculiar form of tapir (*Elanognathus*) inhabits Central America, with one or two peculiar genera of rodents; while such northern forms as *Sorex*, *Vulpes*, *Lepus*, and *Peromyscus* range as far south as Guatemala. Birds are more especially characteristic, since the sub-region possesses no less than 37 peculiar genera of land birds; but many Neotropical groups are absent. The most important of these deficiencies are the *Psittacidae*, and the sub-families *Furnariinae*, *Conoploginae*, and *Rhipidolinae*, as well as most of the peculiar groups of waders. In place of these are found tits (*Paridae*), creepers (*Certhiidae*), waxwings (*Amphispidae*), and turkeys (*Phasianidae*) from the north. The fresh-water fishes as well as the insects are almost wholly Neotropical in character, but exhibit a considerable amount of speciality.

There remains the West Indian Islands or the Antillean sub-region, which in the amount of isolation and speciality it exhibits is better marked than any other part of the region. The Mammalia are few but very interesting, as is usually the case in islands separated from continents by very deep sea. There are no monkeys, Carnivora, Ungulates, or Edentata, the only orders represented being the Insectivora and the Rodentia. The former, which is unknown in South America, is here represented by a peculiar genus, *Solenodon*, belonging to a family, *Centetidae*, only found elsewhere in Madagascar. The Rodents consist of two very peculiar genera—*Cupomys* and *Plagiodontia* belonging to a family, which is especially South American, with a peculiar mouse, and an agouti (*Dryomys*) in the lesser Antilles. The birds are far more abundant, about 200 resident species being known, besides a large number of migrants from the United States. These belong to 95 genera, of which about one-third are peculiar. The only entirely peculiar family group is that of the todes (*Totulidae*), small and elegant birds whose nearest allies are the South American motmots and juncamars.

The reptiles are not very well known, but they seem tolerably numerous, and mostly allied to South American groups; and the same remark applies to the fresh-water fishes. Insects are not very abundant, and beetles seem especially scarce considering the luxuriant vegetation of most of the islands. In land-shells, however, the very reverse is the case, the Antilles being more productive than

any other part of the world. The number of species of West Indian land-shells is equal to that of the entire continent of America, while the number of genera is greater. No less than 11 of the genera are peculiar, a very unusual degree of speciality considering the extensive range of most of the genera of land-mollusca.

VI. The Nearctic Region.—This comprises all temperate North America; and its peculiar fauna is best represented in the United States, and especially in that portion extending from the Mississippi valley to the Atlantic. It is allied both to the Neotropical and the Palearctic regions, but it also possesses a considerable number of peculiar or characteristic forms. Among Mammalia it possesses 3 peculiar genera of moles, 2 of weasels, 2 of hollow-horned ruminants—*Antilocapra* (the prong-buck) and *Apyloceus* (the mountain goat or antelope)—and a number of Rodents, among which the most peculiar are the *Saccomys* or pouched rats. Of those groups which are more peculiarly Neotropical it has skunks (*Meleutis*), raccoons (*Procyon*), and opossums (*Didelphys*). The number of Palearctic groups is greater, the more important being lynxes, vultures, martens, bears, elks, bison, sheep, flying-squirrels, and marmots.

Of birds there are between forty and fifty genera which are peculiar or highly characteristic. Most of them belong to the passerine families, the wood-warblers (*Parulidae*) and the finches (*Fringillidae*) being especially rich in peculiar groups; and there are also a few among the thrushes, wrens, crows, hang-nests, woodpecker, grouse, and some other families. Among the larger birds the turkeys (*Meleagris*), the ruffed grouse (*Caperdonia*, &c.), and the crested partridges (*Oreortyx*, &c.) are the most remarkable.

Reptiles seem to be more numerous than in the Palearctic region. About a dozen genera of snakes are peculiar or characteristic, the most remarkable being the well-known rattlesnakes (*Crotalus*). Among lizards the so-called "glass-snake" (*Ophiosaurus*) is a peculiar form analogous to our slow-worm; while the horned-lizards (*Phrynosoma*) and many other genera of Iguanidae are peculiar. Fresh water fishes are exceedingly numerous and highly peculiar, there being no less than five (or, according to recent authors, eight) peculiar families, and a large number of peculiar genera. The perches and their allies (*Percidae*, *Ictalidae*, *Labridae*, and *Etheostomidae*), the carps (*Cyprinidae*), the suckers (*Catostomidae*), and the catfish (*Siluridae*) are the most abundant groups.

In insects the Nearctic region is not remarkably rich or very peculiar. Its butterflies, though tolerably abundant, belong for the most part to well-known European groups with a small infusion of Neotropical forms in the Southern States. The same may be said of its Coleoptera. Land-shells are tolerably plentiful but not strikingly peculiar; the Alleghany district being the most productive, and possessing a large number of peculiar species. In fresh-water shells North America surpasses every other part of the globe, considerably over a thousand species, most of them *Unionidae* or fresh-water mussels, having been described.

Subdivisions of the Nearctic Region.—Owing to the researches of American zoologists these have been ascertained with tolerable accuracy, and may be termed respectively the Californian, the Rocky Mountain, the Alleghany, and the Canadian sub-regions.

The western or Californian sub-region comprises the narrow tract between the Sierra Nevada and the Pacific, not including Lower California, but extending northward into British Columbia to about 53° N. lat. It is characterized by a few very peculiar forms, and by a greater infusion of South American types than are found in similar latitudes on the east coast. Among Mammals *Neotoma*, a genus of vampire bats, among birds a cuckoo of the genus *Geococcyx*, and 2 genera of humming-birds (*Selasphorus* and *Atthis*); and among reptiles *Lachniscus*, a snake allied to the hogs, are Neotropical forms. California has also five or six peculiar genera of mammalia,—*Urotrichus*, one of the moles, and *Haplocterus*, forming a distinct family of Rodents, being the most remarkable; while

Chamæa, forming a distinct family allied to the wrens, is the most interesting and peculiar bird.

The central or Rocky Mountain sub-region extends eastward from the Sierra Nevada across the Rocky Mountains to a line a little eastward of the 100th meridian, where a marked change in the climate, vegetation, and animal life is found to occur. To the north it is bounded by the great Canadian forest-zone on the upper Saskatchewan, while southwards it extends into Texas and Lower California and along the line of highlands to beyond the city of Mexico. This sub-region is characterized by many peculiar animals, some of which are closely allied to Palearctic types—as the so-called buffalo (*Bison americanus*), the big-horned sheep (*Ovis montana*), the glutton (*Gulo arcticus*), and the pika (*Lagomys princeps*), while others are altogether distinct forms, as the prong-horn (*Antilocapra*) and the antelope or mountain goat (*Aplocerus*). Of Palearctic forms of birds it has two peculiar genera of grouse (*Centrocercus* and *Pedioctes*), and the Arctic wood-pecker and ptarmigan. More especially Nearctic are a genus of wrens (*Salpinctes*) and some peculiar genera of finches and crows. The Nearctic pouched-rats (*Sacomyidae*) are abundant.

The eastern or Alleghany sub-region comprises the country to the east of the last, and as far north as Wisconsin and the southern parts of Canada. It contains examples of all that is most characteristic in Nearctic zoology, and has besides a few peculiar groups. Of these the most noteworthy is the star-nosed mole (*Condylura*), and among birds the passenger-pigeon (*Ectopistes*) and a few groups of wood-warblers and finches. The reptiles are more peculiar, as there are several genera of snakes, including two of *Homalopsidae* and two of rattle-snakes, which hardly extend beyond it. Among lizards the glass-snake (*Ophisaurus*) is peculiar, and no less than four genera of tortoises are almost or quite confined to the sub-region. Here, too, are found the peculiar Amphibia for which North America is so remarkable, such as the two genera of the Sirenidae (*Siren* and *Pseudobranchius*), *Menobranchius* allied to the *Proteus* of Europe, *Amphiuma*, an eel-like creature with four rudimentary feet constituting a distinct family, and three peculiar genera of salamanders (*Salamandridæ*). Fishes, too, are very abundant, and several of the peculiar North American forms are confined to this sub-region; such are the pirate-perch (*Aphredoderus*), the cave-fishes (*Amblyopsidae*), the trout-perches (*Percomysidae*), several genera of sun-fishes (*Ichthyidae*), and many others.

The sub-Arctic or Canadian sub-region has very few distinctive features, but it serves at once to connect and separate the other three regions which almost merge into it. The musk-sheep (*Oribos*) is almost the only form peculiar to it, though this is more properly Arctic. Many of the most characteristic Nearctic animals, such as *Condylura* and *Mephitis*, only just enter its southern borders, while most of the Arctic forms are more abundant here than further south. Great numbers of birds migrate here in summer from the Southern States and Mexico; while a few especially Palearctic groups (as *Budytes*, *Phylloscopus*, and *Pyrrhula*), which do not occur elsewhere in North America, have been found in Alaska. The scanty fauna of Greenland shows that it forms a part of this sub-region.

DISTRIBUTION OF THE HIGHER ANIMALS DURING THE TERTIARY PERIOD.

Before we proceed to other divisions of our subject, we shall find it useful to consider briefly the geographical relations of the Tertiary and post-Tertiary faunas to that which now exists, as we shall thereby arrive at a better comprehension of the true nature of zoological regions, and the meaning of the diverse and complex relations that exist between them.

Post-Tertiary Faunas.—Researches in alluvial clays and gravels, cave-earths, and other superficial deposits have made known to us very completely the character of the fauna which immediately preceded that now existing, and which lived at the close of the glacial period and in the era of prehistoric man. We find, as might be expected, that a considerable number of the Mammalia were identical with living species, but along with these we almost always find a number of extinct forms, some closely related to living species in the same district, while others seem to indicate migration and a change of climate, by their resemblance to species which now only live further north or south. More extraordinary is the fact, that many of these recently extinct forms were of huge size as compared to any now living, often reminding us of the bulkiest inhabitants of the tropics or of those huge animals which we

associate with an earlier condition of the earth's surface. Thus, in Europe during the post-Tertiary period, the reindeer, the glutton, and the Tartarian antelope inhabited France, along with powerful felines allied to the existing lion. At the same time elephants and rhinoceroses of several species roamed all over Europe; and at one period hippopotami ranged as far north as the Thames, while the European beaver was replaced by a much larger species. In North America about the same time we find extinct lions, horses, tapirs, and camels, with bisons and musk-sheep, as well as elephants and mastodons, and along with these, three genera of gigantic sloths as large as rhinoceroses and elephants,—forming an assemblage of large Mammalia wonderfully different from that which now exists in the same country. In South America we find that there were larger monkeys than any now living, together with lions, bears, horses, tapirs, and antelopes, as well as mastodons, and a tree-porcupine as large as a peccary. Here also were armadillos as large as a rhinoceros, and huge sloths as in North America but of more varied kinds. Even in Australia very similar phenomena occur. Extinct wombats as large as tapirs, kangaroos the size of elephants, and a phalanger nearly as large as a lion have been found in cave-deposits, along with a number of other forms more nearly like those now living. But in this case *all* are Marsupials or Monotremes, and there is no sign of any migration from other lands, which indeed, owing to the insular nature of the country, we could hardly expect. Again, in New Zealand and Madagascar we have a similar phenomenon presented to us by the great extinct terrestrial birds—the “moas,” the “dodos,” and the *Epyornis*, which, from the conditions under which their remains are found, have evidently not long ceased to exist.

It appears then that in all parts of the world where we have been able to obtain the requisite information, the period which immediately preceded that in which we live was characterized by great movements or migrations of the higher animals where that was possible; and everywhere, by the extinction of a variety of huge animals belonging to almost every order of Mammalia and to several orders of birds, many of which are now totally unrepresented on the globe.

Tertiary Faunas, and their Geographical Relations with those of the six Zoological Regions.—When we go back to the late and middle Tertiary deposits, we find a series of remains of the higher animals which exhibit yet more remarkable changes of distribution. Various parts of central and southern Europe, for example, were then inhabited by animals which now form the most characteristic features of Ethiopian and Oriental zoology—such as apes and monkeys, lions and hyenas, horses, tapirs, elephants, rhinoceroses, giraffes, and various antelopes, and along with these a number of extinct ancestral forms of many of the same groups. Among birds, too, we find the eastern jungle-fowl, the edible-nest swift, and the trogon, along with African parrots and plantain-eaters. In the Miocene beds of Northern India are found such typical African groups as the hippopotamus and giraffe.

Now geology teaches us, that in the Eocene, or earliest portion of the Tertiary epoch, a continuous arm of the sea extended from the Bay of Bengal to the Atlantic Ocean, cutting off the peninsula of India and Central Africa from the Palearctic region; and it is therefore highly probable that, when this sea-bed became dry land, the various large Mammalia now so characteristic of Africa entered it for the

¹ See Mr Searles V. Wood, jun., “On the Form and Distribution of the Land Tracts during the Secondary and Tertiary Periods respectively, and on the effect upon Animal Life which great changes in Geographical Configuration have probably produced” (*Philosophical Magazine*, 1862).

first time from the north. This will explain many of the peculiarities of the Palearctic, Oriental, and Ethiopian regions, and of their several sub-regions, and especially the persistence of low types in those districts which were wholly or partially protected from the competition of more highly organized animals.

The Tertiary fauna of North America compared with that of Europe exhibits proofs of a former communication between the two northern continents both in the North Atlantic and North Pacific, but always, probably, in rather high latitudes. This is indicated both by the groups which appear to have originated in one continent and then to have passed across to the other, and also by the entire absence from America of many important groups which abounded in Europe (and *vice versa*), indicating that the communication between the two hemispheres was always imperfect and of limited duration.

The past zoological history of North and South America exhibits a somewhat analogous series of phenomena. Their productions were generally very dissimilar. North America, in closer connection with the great northern continent, made an almost equal advance in the development of the more highly-organized animals; while South America, for the most part isolated and thus prevented from receiving a constant supply of immigrants from the larger land-areas, developed a series of lowly-organized creatures, the smaller forms of which still constitute its chief zoological feature.

The knowledge we possess of Tertiary and post-Tertiary Mammalia thus gives us an important clue to the successive migrations of the various groups of animals from one region to another, and to the geographical changes which rendered such migrations possible. The general result arrived at is, that the great northern continents represent the original seat of mammalian life, and the region of its highest development; while the southern continents—Australia, South America, and Africa—have been isolated for varying periods, and, after receiving an immigration of lowly forms, have developed and preserved these to a greater or less extent, according as they were more or less completely protected from the irruption and competition of higher types. Australia, during the Secondary period, received from the northern continent a stock of Marsupials and perhaps some still lower forms, and, having been since completely isolated, has developed these groups alone into its existing fauna. South America, at a somewhat later period, obtained the ancestors of its Edentata and Rodents; and though at various times some higher forms entered it from the north, these never seem to have been sufficiently numerous to overcome its indigenous fauna. In Africa the case was different. For a long time its Mammalia were probably analogous to those of South America; but when the great irruption of higher animals took place in the latter part of the Tertiary period, most of these were destroyed, and a few only remain—such as the *Orycteropus*, the Lemurs, and the peculiar Rodents—as indications of the character of the primeval fauna. In the peninsula of India a very similar course of events occurred, and the fauna of both these countries now consists mainly of comparatively recent immigrants. (For a fuller discussion of this subject see Wallace's *Geographical Distribution of Animals*, chapters vi. to xv.)

The Birth-place and Migrations of some Mammalian Families and Genera—From the knowledge we now possess of the extinct fauna of most of the great continents, it is possible to determine approximately the original birth-place of some now widely distributed groups. The true bears, for example, date back in Europe to the older Pliocene, while in North America they occur only in post-Pliocene deposits. We may conclude, therefore, that they originated in the Old World and are comparatively recent

immigrants in America. True horses of the genus *Equus* are also of older Pliocene date in Europe and of the post-Pliocene, or perhaps newer Pliocene, in America, and are therefore also recent immigrants into the latter country. But it is a curious fact that the most perfect series of ancestral forms of horses occur in the Miocene and Eocene deposits of North America, whence it would seem probable that the earlier stages of the development of this wonderfully specialized animal were effected in America, whence they passed to the eastern hemisphere, and there attained to the full development of the equine type, again, perhaps, to be transferred to America,—to be largely developed there (for remains of eight or ten distinct species have been discovered), and finally to become wholly extinct, while continuing to exist in the Old World, whence the most perfect form has been again introduced, and seems quite capable of maintaining itself in a wild state. Tapirs, though now more abundant in America than in Asia, are an Old World group, going back to the Lower Miocene in Europe, but only appearing in America in the post-Pliocene epoch. The peccaries (*Dicotyles*), now almost wholly Neotropical, are really a North American group, and probably only entered South America in later Pliocene times. Camels, though now confined to Asia and South America, are really a North American form, having been largely developed during the Miocene period, whence the true camels appear to have passed into Asia and the llamas into South America. True deer are European from Miocene times, but only appear in America in the later Pliocene and post-Pliocene epochs. Elephants are an Old World type, abounding from the Miocene period in Europe and Asia, but only appearing in America in the later Pliocene and post-Pliocene times. It is possible, however, that the Eocene *Dinocera* of North America may be ancestral forms of *Proboscidea*, and that, as in the case of the horses, the development of elephants may have begun in America to be subsequently perfected in the larger area of the eastern hemisphere. As a last and curious example we may refer to the marsupial opossums, now exclusively American, but which are certainly recent immigrants from Europe or Asia. No trace of them occurs in American deposits before the post-Pliocene period, while they existed in Europe both in Eocene and Miocene times.

The cases now adduced are sufficient to show how much interest attaches to the distribution of the ancestral forms of our existing animals; but we wait for fuller knowledge of the Tertiary deposits of Asia, Africa, and South America in order to complete the history of these migrations, and to gain some knowledge as to many other groups whose origin is now involved in obscurity (*Geog. Dist. of Animals*, vol. i. p. 153.)

DISTRIBUTION OF MARINE ANIMALS

The zoological regions which serve to represent the main facts of the distribution of land animals are evidently inapplicable to those inhabiting the ocean, except in a few cases where the group is confined to shallow waters or to estuaries. It is true that, as the great continents are separated by the oceans, so the oceans are to some extent separated by the continents, but owing to the superior area of water the separation is far less complete and effective. In the southern hemisphere the Pacific, Atlantic, and Indian oceans freely communicate, and for truly oceanic animals there would seem to be hardly any obstacle against universal distribution. Yet even in this case physical conditions, especially depth and temperature, are found to be effective barriers. The fact that the deep waters even of the tropical seas are cold, renders it indeed possible for some temperate or Arctic forms to cross the equator if they can travel at great depths, but for sur-

face-dwellers the broad expanse of warm water between the tropics, with its hosts of specially adapted organisms, forms an absolute barrier. In like manner the inhabitants of the tropical shallow waters are limited, and it is only by temporary subsidences of land or elevations of the sea-bottom to near the surface, allowing of a passage east or west, that they can migrate into remote areas. We have good reason to believe, however, that subsidences have often occurred between North and South America, allowing of a free interchange of aquatic animals between the Atlantic and Pacific oceans, while in Eocene times a strait is supposed to have connected the Atlantic and Indian oceans, and more recently the Red Sea and Mediterranean have almost certainly been united. We cannot, therefore, expect to find any such strongly-marked zoological regions among aquatic as among terrestrial animals, and the facts at our command entirely confirm this view. For many groups the warm and the cold, or the northern, tropical, and southern seas, are the only well-marked divisions; while for others the North Atlantic, the North Pacific, and the Indian Ocean form additional regions of a more or less defined character. For special studies of the more highly-organized marine groups—as the Mollusca or Crustacea—a host of provinces and sub-provinces have been formed, each important sea or coast presenting some peculiar features, but as these divisions mostly depend on specific rather than generic distribution, they need hardly be noticed here.

Owing to the absence of any well-marked regions, and the general imperfection of our knowledge of the distribution of marine animals, we must follow a different plan in our sketch of this subject from that adopted for the terrestrial fauna. We propose, then, to notice successively the more important classes of marine animals, and to state briefly what general facts are established as to their distribution.

Foraminifera.—These exceedingly low organisms are important, because their shells or tests are found extensively in various geological formations, and often form a considerable part of the constituents of rocks. They are found in all seas, and the species have often an enormous range. The surface swimmers are almost universally distributed, while the bottom-livers—as the writer is informed by Mr H B Brady—appear to be distributed according to depth and latitude rather than to follow any circumscribed areas. This gentleman is now engaged in working out the “Challenger” collections, and already sees reason to think that there may be found some differences between Atlantic and Pacific, and also between North Atlantic and South Atlantic forms. These organisms have been found living in the surface waters and down to a depth of 2000 fathoms, but only their dead remains are brought up from the floor of the deep ocean.

Spongiada.—Sponges form another extensive group, often preserved as fossils, of which our knowledge of the recent forms is rapidly increasing. There seems, however, to be little geographical limitation of groups. The freshwater *Spongiellæ* are found in all regions. The horny and calcareous sponges are widely distributed, but are much more abundant in warm and tropical seas. The beautiful siliceous sponges—of which the glass-rope (*Hyalonema*) and Venus's flower-basket (*Euplectella*) are conspicuous examples—are found scattered throughout all warm seas, and have recently been found in abundance in many of the great ocean depths,—in the Atlantic at 2650 fathoms, and in the Pacific at 3000 fathoms,—so that they probably exist wherever the nature of the bottom is favourable (Sir Wyville Thomson, *Depths of the Sea*, “Reports from the ‘Challenger,’” *Proc. Roy. Soc.*, vol. xxiv., Bowerbank's “Papers on Sponges” in *Proceedings of Zoological Society*, 1869–1874.)

Actinozoa.—The coral-bearing groups of these animals are the more important, because of the abundance of fossil forms of every geological age. By far the greater number of these are found exclusively in tropical seas. Many of the *Alcyonaria* are temperate and even Arctic, while among the *Zoantharia* the *Caryophyllidæ* alone are well represented beyond the tropics. The distribution of corals is in great part determined by the physical conditions of the sea-bottom. An influx of fresh water or of mud brought down by rivers is fatal to them, and volcanic deposits seem to be almost equally prejudicial. A high temperature is also necessary for most of the groups. Coral reefs are therefore restricted to certain seas and coasts within or near the tropics. They abound in and near the West Indies, on the east coast of Africa, in the Indian Ocean, in the Malay and Pacific archipelagoes, and on the coast of Australia, while they are absent from the whole of the west coasts of South America and of Africa, from the Indian peninsula, and from much of the east coast of South America. The coral-reefs of the Bermudas, in 33° N. lat., are the farthest from the equator, in the Red Sea they reach 30° N., in the Pacific 27° N., while they nowhere extend to more than 29° S. of the equator. Besides the corals actually forming the reefs, the same localities abound in what are termed deep-sea corals, and thus the general distribution of the group is determined by similar conditions. The coral regions are therefore somewhat peculiar, and differ considerably from those which best exhibit the distribution of other marine animals. The regions adopted by Mr Dana are three,—the first comprising the Red Sea and Indian Ocean, the second, the whole of the Pacific islands and the adjacent coasts of Australia, and the third the West Indies. This last region is the most isolated in position, and it is not surprising that it should contain the largest proportion of peculiar forms. The corals of the Central Pacific are also very peculiar, as are those of the Red and Indian seas. Considering the great similarity of the molluscan fauna of the Pacific and Indian oceans, it is remarkable that the corals should be so different as Mr Dana's tables show them to be. Although some corals exist at great depths in the ocean, they diminish rapidly when we pass the moderate depth of 200 fathoms. The “Challenger” expedition obtained 27 genera at a greater depth than 250 fathoms, but only 3 of these extended below 1500 fathoms. Count Pourtales on the American coast found them at 400 fathoms, the “Porcupine” expedition first found them at a greater depth than 1000 fathoms in the North Atlantic, while in the Pacific a single species has been found at the enormous depth of 2900 fathoms. The following genera were obtained by the “Challenger” dredgings at a greater depth than 1000 fathoms:—*Caryophyllia*, *Deltocyathus*, *Ceratopichus*, *Flabellum*, *Amphipheelia*, *Cryptohelia*, and *Fungia*. Some of these were of brilliant colours—pink, madder-red, white, and emerald green. A large proportion of fossil genera of corals survive in the deep seas, no less than seven genera, before only known in the fossil state, having been added by the explorations of the “Challenger,” seven of these are found at or below 1000 fathoms. It is curious, however, that the deepest by far of all corals, *Fungia*, is not known to be fossil, nor is any member of the family *Stylasteridæ*, six genera of which are deep-sea corals, so that too much importance must not be attached to the fact of genera hitherto only known as fossils having been found living at great depths in the ocean. (Dana's “Zoophytes” in *U.S. Exploring Expedition*, vol. vii., “Report on Corals Dredged by the ‘Challenger,’” by H. N. Moseley, *Proc. Roy. Soc.*, vol. xxiv. p. 544.)

Polyzoa.—The coral-like Molluscoida forming the extensive group of marine polyzoa, have been carefully studied,

but they are so widely distributed as to offer few special features of distribution. One or two families—as the *Selenariadæ*—are almost exclusively tropical, others—as the *Catenicellidæ* and *Vinculariadæ*—are confined to the southern hemisphere. The *Diastoporidæ* are mostly northern, while the *Celleporidæ* are found in both north and south temperate seas. But the great mass of the families are either universally distributed or widely scattered over the globe. They range to high northern latitudes, having been found abundantly by the Swedish expedition on the shores of Nova Zembla in 70° N. lat. They inhabit the profound depths of the ocean, having been dredged from near 2000 fathoms in the North Atlantic, 2500 fathoms in the Pacific, and 2650 fathoms in the Southern Ocean during the voyage of the “Challenger.” (Bask’s *Brit. Mus. Catalogue of Marine Polyzoa*; “Challenger” Reports,” *Proc. Roy. Society*, vol. xxiv. pp. 466, 468, 572, 635.)

Echinodermata—The best-known groups—the starfishes and sea-urchins—occur abundantly as fossils, but their existing distribution does not offer many features of special interest. The *Asteroidæ*, or star-fishes, are most abundant in the Indian and Pacific oceans, while the *Ophiuroidea* (brittle stars) are better represented in the European and African seas. A few genera are exclusively American, but on the whole star-fishes are far less abundant in the western than in the eastern hemisphere. Although most abundant in shallow seas, they also inhabit the floors of the deepest oceans, some having been obtained by the “Challenger” expedition from a depth of 2700 fathoms in the Pacific. They abound even in the Arctic seas, “hundreds of seastars” having been obtained by a single haul of the swab at 76° N. lat. in Novaya Zembla by the Swedish exploring ship “Proven” in 1875. The *Echinoidea* (sea-urchins) are also very abundant in Eastern seas, while they are comparatively scarce in America. Although much larger and more varied in the tropics, they are tolerably abundant in temperate and cold seas, and they probably reach the greatest depths in the ocean, since some have been obtained by the “Challenger” from a depth of nearly 3000 fathoms in the North Pacific. (*Nature*, vol. xii. p. 556, Van der Hoeven, *Handbook of Zoology*.)

Crustacea—The distribution of the higher Crustacea has been discussed in detail by Mr James Dana in the *Zoology of the United States Exploring Expedition*; and, considering that most of the species are shore-dwellers, the facts are very interesting and often quite unexpected. We will, therefore, give an abstract of the conclusions of this writer.

The marine regions which best represent the distribution of these animals are three in number, termed by Mr Dana the Occidental, the Africo-European, and the Oriental. The first comprises both coasts of the American continent; the second, the eastern shores of the Atlantic both African and European, and the third comprehends the vast area from the east coast of Africa to the Central Pacific. Each of these is of course subdivided into climatal and local provinces, but the primary divisions alone are those which we have now to consider. The facts adduced in support of this scheme of distribution are very interesting. No less than 47 genera are exclusively American, and 15 are common to both the east and west coasts, but as 26 genera are said to be confined to the west coast, and 6 to the east, it will be seen that these two provinces are really very distinct, even if they do not form primary regions. The Africo-European region has 19 peculiar genera, and only 8 in common with the American region, so that the eastern and western shores of the Atlantic are decidedly more distinct than the eastern and western coasts of America. The extensive Oriental region is by far the richest, containing

no less than 115 peculiar genera, and only 19 in common with the Africo-European region. About 40 genera are said to be found in all three regions.

The distribution of Crustacea in relation to temperature also presents some peculiar features. The species are almost equally divided between the tropical and the extra-tropical regions. The highest form of Crustacea—the Brachyura—are most abundant in the tropics, while the less developed Amphipoda and Isopoda are more numerous in temperate and frigid zones. This may, however, in part depend on these groups having been less assiduously collected in the tropics. More interesting, and less open to doubt, is the fact that among the four chief types of Crustacea—Brachyura, Macroura, Isopoda, and Amphipoda—the most highly developed species are extra-tropical. The largest species of the Macroura are found in temperate seas, and though the largest Brachyura are tropical, yet the Maioids—the highest group of Brachyura and of all Crustaceans—reach their largest dimensions in the temperate zone. Mr Spence Bate adduces the curious fact that in the cosmopolitan sub-family *Lyconacina*, the largest species are found in Arctic and Antarctic latitudes, while a species from the Straits of Magellan so closely resembles one from Spitzbergen that they may even be identical, and in the family *Caprellula* the same species often occurs in both the northern and southern hemispheres. Mr Dana lays great stress on similar cases of wide and discontinuous distribution, which (he considers) necessitate the adoption of the theory of special creations. Thus, two species (*Kraussia rugulosa* and *Galeus natalensis*) are found at the Hawaiian islands and Natal, but in no intermediate localities. Other identical species occur in the Japan seas and Natal. The same species (*Plagusia torrentosa*) occurs in South Africa, New Zealand, and Valparaiso; and another (*Cancer Edwardsi*) at New Zealand and Valparaiso. The same species and several identical genera (*Labidulla*, *Ephysa*, *Sigonia*) are found in the Mediterranean Sea and Japan, but in no intermediate districts. Closely allied species (of the genera *Amphiroidea* and *Ozura*) are found in Australia and Chili, but perhaps the most singular fact is the occurrence of closely allied or perhaps identical species of *Palaemon* in New Zealand and the British Sea, and also of certain British or American genera (as *Portunus* and *Cancer*) in New Zealand. Many of these cases, and more especially the last, undoubtedly offer great difficulties on the theory of transmission and specific modification. There are, however, some considerations which afford hints for a possible solution of the difficulty. We now know many cases in which the distribution of an animal or a group of animals has been rendered discontinuous by its recent extinction in intermediate localities. The tapirs, for example, exist only in tropical America and the Malay islands, and it might well be argued that no passage from one of these localities to the other is conceivable for such an animal. But we now know that the South American tapir lived in North America down to post-Pliocene times, that in Europe there were tapirs in the later Pliocene period, while in the Pliocene or Miocene periods allied species inhabited North India and some parts of China. The present remotely isolated forms are therefore seen to be the remnants of a genus which once ranged over almost the whole northern hemisphere. Perhaps more to the point is the case of the genus *Panopæa*, adduced by Mr Woodward in his *Manual of the Mollusca*. There are only 11 living species, which occur widely scattered in the northern seas, the Cape of Good Hope, Australia, New Zealand, and Patagonia. But of this same genus nearly 150 fossil species are known, distributed over many intermediate localities, so that the existing species are seen to be but relics of an ancient form of life lingering at various points on the outskirts of the

vast area it once occupied. Such cases as these occur in all classes of animals where our knowledge of the extinct fauna is sufficiently extensive, and we are therefore justified in believing that a large proportion of the existing instances of anomalous and discontinuous distribution are to be explained in a similar way. In the case of the Crustacea we must also take into account our comparative ignorance of many parts of the globe, and especially our ignorance of the powers of dispersal of the ova, and of the young animals during their earlier larval condition. This dispersal may systematically occur to a far greater extent than we are yet aware of, though only in rare and exceptional instances may a species succeed in maintaining itself beyond the normal limits of its race. The certainty we are now acquiring of the long duration and wide spread influence of the glacial period must also materially affect such questions as these; for although the equatorial lowlands may never have suffered from its influence, it is highly probable that during the period of greatest cold the temperature of the entire ocean may have been lowered, while in certain directions cold currents may have afforded a passage for temperate forms of marine animals from the northern to the southern hemisphere. While admitting, therefore, that the distribution of Crustacea presents to us some problems of extreme difficulty, we must deny that they are such as to justify us in resorting to a solution such as "special creation," which is negatived by the evidence afforded by almost every other class of animals.

The reports of the "Challenger" expedition already published afford valuable information on the distribution of Crustacea in the oceanic depths. The higher forms (Decapoda) have been found living at a depth of 1875 fathoms in the North Pacific, 2600 fathoms under the equator, and 2385 fathoms in the South Pacific. In the North Atlantic, at a depth of 1900 fathoms, was found a cray-fish allied to the *Astacidae*, but deprived of even the rudiments of eyes, while others equally blind (from both the Atlantic and Pacific) are believed to have their nearest allies among the extinct *Uryonidae* of the Jurassic period. The higher Crustacea, which are most abundant at great depths, and which have afforded the greatest variety of new and interesting forms, belong to the Selizopoda. They have been found at depths of more than 2000 fathoms in the Pacific, and down to 2550 fathoms in the Atlantic Ocean. Some of them are blind, but a more remarkable fact is, that many of them are brightly coloured, though living in absolute and perpetual darkness. Among the Edriopthalmata (sessile-eyed Crustacea) examples of the remarkable blind family *Munopsidae* have been found at a depth of 2175 fathoms in the Atlantic, and at nearly 2000 fathoms in the Southern Ocean. Other forms usually found in shallow water (*Serolis*) also occurred at great depths—more than 2000 fathoms in the Pacific, and one of these, obtained near the southern ice-barrier at a depth of over 1900 fathoms, was of "a fine blue colour with a red spot over the middle of the body." Entomostraca also occur at great depths, the most remarkable being a gigantic Ostracod found at 1600 fathoms in the Southern Ocean. At 1375 fathoms, near the Crozets, a Pycnogonoid (sea-spider) was obtained, measuring 2 feet across the legs. But besides these bottom-dwellers, the trawl nets at different depths showed that the ocean is inhabited by peculiar tribes of free swimmers—principally Copepoda, Amphipoda, and Cypridinæ, often of a bright orange colour. Those occurred in all parts of the Pacific to a depth of 2000 fathoms, but they were never found in the surface nets. (*United States Exploring Expedition*, vols. xiii. and xiv., Spence Bate on "Geographical Distribution," in Spence Bate and Westwood's *British Sessile-Eyed Crustacea*; Dr. Rudolf von Willemoes-Suhm's "Report on the

Crustacea of the 'Challenger,'" *Proc. of the Royal Society*, vol. xxiv. p. 585.)

Cirrhupedia—The barnacles are a tolerably extensive group of anomalous Crustacea, whose distribution differs somewhat from that of the more typical portion of the class. The genera are almost all widely or universally distributed, from 74° 18' N. lat. to Cape Horn, and some of the species have an equally wide range. No genus having more than a single species is confined to the torrid zones, and only two genera are limited to the southern hemisphere. Although the temperate zones have a smaller area than the torrid, they possess rather more species of Cirrhupeds, which Mr Darwin imputes to the fact of these zones being *two*, while the torrid is but *one*. As in some groups of the higher Crustacea, large species are most abundant in the temperate zones. Owing to the wide range of the genera the Cirrhupedal regions can only be determined by the distribution of species. These, according to Mr Darwin, are as follows:—1. The North Atlantic, comprising North America and Europe down to N. lat. 30°, 2. The West American, from Behring Straits to Tierra del-Fuego; 3. The Malayan, from India to New Guinea, 4. The Australian, comprising Australia and New Zealand. The Malayan and Australian regions are the richest in Cirrhupeds. During the voyage of the "Challenger" these animals were found to inhabit the deep seas, the most remarkable being a gigantic *Scalpellum* from a depth of 2850 fathoms in the North Atlantic, while other forms occurred at almost the same depth in the Pacific. (Darwin's "Monograph of Cirrhupedia," *Roy. Society*, 1854.)

Mollusca—The marine Mollusca, from their great abundance in all seas, the ardour with which they have been collected and studied, and the frequency of their occurrence as fossils, offer an extensive field for the study of distribution. But many causes have combined to render the results yet arrived at unsatisfactory. Their classification has been for some time undergoing a progressive change, owing to the greater attention paid to the organization and development of the animals, but there is still much uncertainty as to the limits of genera and subgenera. Owing to their being in many cases articles of commerce, either on account of their uses or their beauty, the place where they were originally obtained has often been confused with the place from which they were exported. Their numbers, too, have so rapidly increased that few persons have been found to devote themselves to the great labour of geographical tabulation. And, lastly, the genera are so often of great extent and world-wide distribution that the range of species alone has generally been attended to.

The late Dr Woodward established a series of eighteen marine provinces, founded professedly on the fact of one-half of the species being peculiar. The distribution of the genera is only casually mentioned, and it is almost certain that a large number of these provinces have no claim to rank as primary regions as regards the distribution of the Molluscan fauna. Dr Woodward himself states that his Arctic province is comparatively small and exceptional, while the three southern faunas of America, Africa, and Australia differ extremely. All the warmer provinces may, he says, be naturally grouped into three great divisions—the Atlantic, the Indo-Pacific, and the West American, and these are perhaps the only true Molluscan regions. The Indo-Pacific extends from the Red Sea and east coast of Africa to the easternmost Pacific islands, and exactly corresponds to Mr Dana's Oriental region for Crustacea. About 100 species are said to range over nearly the whole of this vast area. The Atlantic region unites the fauna of the east coast of America with that of West Africa and South Europe, but it also has considerable affinity for that

of West America, since about 60 genera are common to both. Several important genera appear to be restricted to the north temperate zone, which should perhaps form a distinct region. About 30 important genera are confined to the Indo-Pacific region; and nearly 20 are peculiarly tropical. The Atlantic coasts have few peculiar genera of importance, and the west coast of America hardly any, its difference from the Atlantic fauna on the one side and the Pacific on the other being chiefly specific. There is said to be not a single species common to the east and west coasts of tropical South America; while the corresponding coasts of North America have more than 50 species in common, and many others so closely representative as to be almost equivalent to identical species.

The shells of the Mediterranean were once supposed to be very peculiar, but recent dredgings have proved that most of them exist also in the Atlantic, and it is now doubted if any are really confined to that sea. A small number (about 70 or 80 species) are identical with Red Sea shells. The marine-shells of Australia and New Zealand are exceedingly unlike those of Britain,—exactly the reverse of what obtains among the Crustacea.

The influence of temperature on the distribution of Mollusca is very marked, the warmer regions presenting a greater variety of forms, with a greater proportion of large and finely-coloured species. Yet in some cases the largest species are extra-tropical, a striking example being found among the volutes, which abound in tropical seas, yet attain their largest size in New Zealand. In temperate and even in Arctic seas Mollusca are perhaps as abundant individually as in the tropics, but the number of species and genera is far less, and they are generally dwarfed in size, and of obscure colours.

Until a comparatively recent period very few shells had been obtained at a greater depth than 200 fathoms. These were mostly of small size and obscure colours, belonging to groups of wide range and great geological antiquity. *Dentalium*, *Cryptodon*, *Leda*, and *Arca* were the most important, and it was generally believed that the zero of Molluscan, if not of all but the very lowest forms of life, would be found at a depth of 300 or 400 fathoms. The recent development of deep-sea dredging has, however, completely changed our ideas on this subject, and the Mollusca as well as most other groups of Invertebrata are found to be capable of existing in the profoundest depths of the ocean. Off the coast of Norway Professor Sars has obtained Mollusca from a depth of 450 fathoms; and near Florida, Agassiz found them at 500 fathoms. During the cruise of the "Porcupine" Professor Wyville Thomson obtained species of *Pleurotoma* and *Dentalium* from the enormous depth of 2500 fathoms in the Bay of Biscay. During the recent voyage of the "Challenger" many other groups have been discovered in the deepest seas. In the North Atlantic, 500 miles west of Tenerife, three small living Mollusca belonging to the genera *Arca*, *Limopsis*, and *Leda* were dredged from a depth of 2740 fathoms; while in the Central Pacific, from a depth of 2425 fathoms, species of *Arca*, *Neora*, *Pleuronectia*, *Trochus*, *Fusus*, *Dentalium*, and some others have been obtained. All are small obscurely-coloured forms, resembling Arctic rather than tropical shells, due no doubt to the fact that in these profound depths the water is permanently at a temperature very little differing from that of melting ice. Equally interesting is the fact ascertained by the naturalists of the "Challenger," that the waters of the ocean down to the enormous depth of 1500 fathoms abound with true pelagic Mollusca belonging to the orders Pteropoda, Heteropoda, and Gasteropoda, while below this limit they appear to be absent (Woodward's *Manual of the Mollusca*; "Challenger" Reports," *Proc. Royal Society*, vol. xxiv.

pp 536, 578; Letters of Sir Wyville Thomson, in *Nature*, vols. 7-10.)

Fishes.—The distribution of marine fishes appears to agree generally with that of the Mollusca and Crustacea; their greater powers of locomotion, leading to a wider dispersal, being to some extent compensated by the more recent origin of most of the species, genera, and families. There are about 80 families of marine fishes, and no less than 50 of these are almost universally distributed. Several other families range over all tropical seas. About 5 families are found only in the Arctic and temperate seas of both hemispheres, while two (*Discobolus* and *Accipenseridae*) are found in the north temperate seas only. The best marked region is undoubtedly (as in the Mollusca and Crustacea) that which extends from the Red Sea and east coast of Africa to the Sandwich Islands and Australia. About ten families are confined to this region (which may be termed the Oriental or Indo-Pacific marine region); many genera of other families equally characterize it, while there are even a number of species which range over the greater part of its vast area. On the other hand, no family of importance seems to be confined to the Atlantic, or to the coasts of Eastern or Western America, the differences of these provinces, as of the European and American shores of the Atlantic, being confined to generic and still more largely to specific forms. Many species of fish have enormous ranges, extending from the North Atlantic to Australia, from the Red Sea to the Sandwich Islands, and from New Zealand to South America. Some species range over almost the whole Atlantic Ocean, and a considerable proportion of those inhabiting the Atlantic and Pacific coasts of Central America have been found by Dr Günther to be identical.

It has long been known that a considerable number of fishes inhabit very deep water, never coming to the surface when alive, but the researches of the "Challenger" expedition have added greatly to our knowledge of these curious forms. A large number of genera and species, many of them new, and belonging to ten distinct families, have been obtained in the nets and trawls from a depth of 200 to 2400 fathoms in all the great oceans. These often come up greatly inflated by the expansion of the intercal gas; some were transparent, several were blind, and some had curious phosphorescent organs on the head. These deep-sea forms generally have a wide range. The greater number of the new and remarkable forms obtained during the voyage of the "Challenger" belong to the *Scopelidae*, a family known to inhabit the deep waters of all the warmer seas. The size attained by marine fishes appears to have no relation to latitude or temperature. (Günther's *British Museum Catalogue of Fishes*, Mr J. Murray's "Preliminary Report on Vertebrates collected by the 'Challenger,'" *Proc. Roy. Soc.*, vol. xxiv. p. 537.)

Marine Turtles.—These reptiles, forming the family *Cheloniidae*, are too few in number and too widely distributed to afford any indications as to oceanic regions.

Cetacea.—The whales and dolphins form the only group of truly oceanic Mammalia. They are very widely distributed, but their classification is too unsettled, and their history too imperfectly known, to throw much light on the general question of oceanic distribution. Two of the families—*Balaenidae* and *Balaenopteridae*—seem to be confined to the cold and temperate seas of both hemispheres. The *Catodontidae* (comprising the sperm whales), on the other hand, are more especially tropical and sub-tropical. The *Hyperoodontidae*, or beaked-whales, are widely distributed in northern, southern, and tropical seas; while the largest family—the *Delphinidae*—are universally distributed. The largest whales inhabit the cold northern and southern seas (Dr J. E. Gray's *British Museum Catalogue of*

Whales and Seals, Mr Andrew Murray's *Geographical Distribution of the Mammalia*.)

General Relations of Marine with Terrestrial Zoological Regions.—The general facts of distribution of marine animals now adduced accord very well with what we know of those terrestrial changes which have led to the actual distribution of land animals. The great Indo-Pacific region—so well marked in every important group of marine animals—probably owes its individuality to the fact that Australia has been isolated during the whole of the Tertiary, and probably during much of the Mesozoic epoch, while numerous islands in the Indian and Pacific oceans have always afforded an extensive shore-line favourable to the development of aquatic forms of life. The Atlantic has probably been for long periods even more inclosed than it is now, owing to the greater southward extension of South Africa and South America; while the profound depths of its central channel have served as a barrier between the inhabitants of the shallow waters of its eastern and western shores. In like manner the great trough of deep water which separates the most eastern groups of the Pacific islands from the west coast of America has necessarily led to the establishment of distinct oceanic faunas in these regions; while this very fact—the remarkable distinctness of the Pacific and West American faunas—tells us plainly that this barrier of deep ocean is one of the ancient features of the earth's surface.

We shall find, too, that many of the details, and not a few of the anomalies, of the distribution of marine animals become intelligible from our knowledge of past geographical changes. The considerable affinity between the Crustacea, Mollusca, and fishes of the eastern and western coasts of America exactly corresponds to the fact, clearly established by a consideration of the distribution of living and extinct land animals, that these oceans have been united, at several distinct periods, by two or more channels over what is now Central America, the final union of the two continents being comparatively recent. The fact that the routing channels were always situated within the same limited area sufficiently explains the considerable amount of generic and specific difference of two faunas ranging over coast-lines running north and south for many thousand miles on the opposite sides of great continents. The curious fact (only recently established) that so deep and extensive an inland sea as the Mediterranean contains but few peculiar marine animals, becomes quite intelligible when we consider that till middle or late Tertiary times it consisted of two inland seas or lakes. Such inland seas are always very poor in animal life; and it is therefore not surprising that the Mediterranean should now contain hardly any forms but such as it has received from the Atlantic, or from the Red Sea during a submergence of the Isthmus of Suez. The numerous allied or even identical forms in the northern and southern oceans, which are not found in the intervening warm regions, are more difficult to explain. Mr Darwin believes that such facts are due to the action of the glacial period, which at its height may have cooled certain tracts of the tropical ocean sufficiently to allow temperate forms to cross from the northern to the southern hemisphere or the reverse. Perhaps, however, the agency of icebergs may have been sufficient without any permanent cooling of the equatorial ocean; for even now these huge floating glaciers often reach to 40° N. lat and 35° S., and, Captain Maury assures us, sometimes even reach the tropics. We may therefore well suppose that during the height of the glacial period icebergs would not only regularly reach the tropics, but, carried on by currents in definite lines, might often pass across the equatorial zone, carrying with them a girdle of cold water in which many inhabitants of the Arctic or Antarctic seas might safely

make the passage to another hemisphere. The fact that many forms of plants peculiar to cold or temperate regions are found scattered on isolated mountain summits in the tropics is, as Mr Darwin has shown, to be explained only by the influence of an extreme glacial period, and this must have produced analogous effects on the inhabitants of the ocean. (*Origin of Species*, 6th ed p 330)

DISTRIBUTION OF ANIMALS IN TIME.

This subject will necessarily be treated in some detail under the articles GEOLOGY and PALÆONTOLOGY. Here we shall only sketch its outlines and general principles.

The past history of living things as revealed by geology is an ever-changing panorama. At each successive stage some forms disappear, while new ones take their place. The farther we go back the more unlike is the general assemblage of animals and plants to that which now exists. If we confine our attention to any one class or order of animals, we find that it makes its first appearance at some definite epoch, and, under successively changing forms, either continues till the present time, or reaches a maximum, diminishes, and finally disappears. Thus some groups are altogether modern, others extremely ancient, some have run through all their phases in a comparatively short period, others have lived from the earliest epochs of the earth's history of which we have any record and still survive. If we could be sure that the numerous fossils yet discovered gave us anything like an adequate idea of all the varied forms of life that had ever lived upon the globe, and the order in which they had appeared, we should be in a position to decide as to the truth and value of the development hypothesis. But the more we examine the question, the more certain it becomes that the "geological record," as it is termed, is extremely imperfect, and that the whole of the extinct animals which we have discovered do not form any fair representation of the entire series that have lived upon the earth. This is the case even with the more recent deposits and those which are richest in animal remains; but as we go back into the past the record becomes more and more imperfect, till in the Secondary, and still more in the Paleozoic formations, we only have preserved to us a few scattered fragments, equivalent perhaps to a few pages with here and there a short chapter taken at random out of a voluminous history. The causes of this necessarily imperfect record of the past have been fully discussed by Sir Charles Lyell and Mr Darwin; we need only refer here to two general causes of such imperfection. The first is, that every aqueous deposit is formed by the wearing down of previous deposits, so that the records of one age are, to a large extent, necessarily destroyed to provide the records of the next, which in its turn is destroyed in a succeeding age. The other cause of imperfection is, that extensive areas are always sinking (to allow now deposits to be formed over them), and are being subjected to subterranean heat to such an extent as to change their texture and obliterate their fossils, when they become crystalline or metamorphic rocks. The more recent deposits so acted on will rarely have had time to have become raised above the sea-level, and subsequently exposed by denudation, yet certain Eocene strata in the Alps are stated by Sir C. Lyell to be truly metamorphic (*Students' Elements of Geology*, p 600). The older a formation is, therefore, the more frequently will it have been exposed in one area or another to this metamorphic action; and it follows that, going backward in time, we shall at last come to a period, all the formations antecedent to which will have become metamorphosed, and their fossils, if any, obliterated. We appear to have almost reached such a state of things at the base of the Paleozoic rocks, and there is good reason to believe

that an extensive series of fossiliferous deposits may have once existed, whose record of the earlier stages of the history of life upon the earth has been either destroyed by denudation or obliterated by internal heat. This being the case, we must carefully distinguish between positive and negative evidence, and we may also fairly apply such principles as can be established by means of the fuller record afforded by the Tertiary deposits, to interpret the more scanty and fragmentary record with which we have to deal in the older rocks. We will now proceed to sketch very briefly the successive stages of the development of animal life as indicated by the materials at our command.

The lowest and most ancient of all the stratified rocks is the Laurentian, consisting of crystalline beds of gneiss, mica-schist, quartzite, and limestone, reaching in Canada the aggregate thickness of 30,000 feet. The whole mass was long thought to be destitute of organic remains, till in one of the beds of limestone in the lower part of the series a curious structure was discovered, which is held by Dr Carpenter and Professor Rupert Jones, who have made a special study of the Foraminifera, to be the fossilized remains of one of that group of the Protozoa. It has been named *Eozoon canadense*, and if really organic (which is denied by some naturalists of eminence) is by far the oldest trace of animal life. The Upper Laurentian deposits, 10,000 feet thick, lie unconformably on the lower, and seem to be entirely destitute of fossils.

The next formation is the Cambrian, largely developed in Wales, Scandinavia, Bohemia, and North America, and consisting of a variety of distinct deposits. But in the very lowest of these (the Longmynd group) abundant organic remains have recently been found, comprising perfectly developed brachiopods and pteropods, Mollusca, entomostracous Crustacea, and Trilobites. In the overlying beds of the same formation similar forms abound, and are accompanied by sponges, annelids, graptolites (which are supposed to be peculiar extinct Hydrozoa), starfishes, and encrinurites. Here also first appear lamellibranchiate Mollusca, belonging to the families *Arcada*, *Nuculida*, and *Atlantida*, and there are even some *Orthoceratida*, belonging to the highest order of molluscs—Cephalopoda. The Trilobites are already wonderfully varied, the smallest and largest kinds being found here (one 2 feet long), species with the least and with the greatest number of rings, blind Trilobites, and others with the most largely developed eyes. (Lyell's *Students' Elements of Geology*, pp 483, 485, 634.)

We next come to the Silurian formation, in which we first meet with corals, of the three great divisions Rugosa, Tabulata, and Perforata,—ostracode Crustaceans, Trilobites in enormous variety, Merostomata—extinct Crustaceans of gigantic size, Echinoidea (*Palæchuus*), and true gastropodous Mollusca. And lastly, in the Upper Silurian deposits, we find vertebrates, whose first representatives are several genera of fishes belonging to the Ganoid and Plagiostomous groups.

In the succeeding Devonian formation we find an abundance of new families of fishes, a fresh-water mussel of the living genus *Anodon*, and no less than six forms of winged insects. These have been found in the Devonian rocks of New Brunswick, and are considered by Mr Scudder to be ancient forms of Neuroptera.

The Carboniferous formation is very rich in animal as well as vegetable remains, and, along with most of the animals already met with, we find several higher types of great interest. The higher macrurous Crustacea (*Anthropalemon*) are here first met with, as are true air-breathing molluscs, numerous specimens of the living genera, *Pupa* and *Zonites*, having been found in the coal-fields of Nova Scotia. Along with these are insects of various orders—

Myriapoda, scorpions, spiders, Orthoptera, Neuroptera, Coleoptera, and even Lepidoptera. Here, too, we meet with air-breathing vertebrates—the Labyrinthodonts, ancient forms of Amphibia which occur in considerable abundance and variety. (Lyell's *Students' Elements*, p 408, *Annales de la Société Entomologique de Belgique*, 1875, tom xviii, where a wing from the coal-measures, closely resembling those of moths belonging to the family *Saturniidae*, is photographed.)

In the Permian formation, which closes the series of Palæozoic rocks, we have the important addition of true Lacertian reptiles (*Protosaurus*), which, according to Professor Huxley, differ wonderfully little from some living groups. What are supposed to be Chelonian footprints have been discovered in the Permian sandstones of Dorsetshire (Huxley's *American Addresses*, p. 41.)

Entering the Secondary period with the Triassic formation, we at once meet with higher forms of life. Among Crustacea we first find traces of the brachyurous division of Decapods (Etheridge, in Lyell's *Students' Elements*, p. 632) and many new forms of Mollusca. Among reptiles the Dinosauria, Dicynodontia, Plesiosauria, and Crocodilia appear, what seem to be undoubted footprints of birds have been found in the New Red Sandstone of Connecticut (see figures in Lyell's *Students' Elements*, p. 371, and Nicholson's *Palaontology*, p. 389); and all improbability of this early appearance of birds is removed by the fact that a little higher in the same formation remains of a true Mammalian have been undoubtedly discovered. This is the *Micolestes*, founded on well-preserved teeth from a bone bed in the Upper Trias of Wurtemberg, and since found also in the Rhaetic beds of Somersetshire; while in rocks supposed to be of the same age in North Carolina the lower jaw of an allied form (*Dromatherium*) has been obtained. Both are believed to be Marsupials, and most nearly allied to the *Myrmecobius* of Australia.

In the Jurassic or Oolitic period, the main forms of life which have already appeared are further developed. Insects of all orders are found, and they can mostly be classed in existing families and even genera, as—*Locusta*, *Nepa*, *Sphinx*, *Termes*, *Ephemeræ*, *Agrion*, *Eshna*, *Agrion*, *Prionus*, *Libellula*. (Rev. P. B. Brodie, in *Proc. Warwickshire Nat. Hist. Soc.*, 1873.) Among reptiles, *Chelon* and *Ichthyosaurus* are added. Of birds we have the long-tailed and feathered *Archæopteryx*; while no less than eight genera of small Mammalia have been discovered, most of them Marsupials, though some may have been ancestral forms of Insectivora. Many living genera of shells, both marine and fresh-water, first appear; and among fishes, true sharks of the existing family *Notidanidae*.

In the Cretaceous period, we make a still further approach to living forms. The highest Crustacea (Brachyura) are tolerably abundant, and the living genus *Cancer* appears. Mollusca (Lamellibranchiata and Gastropoda) are represented by a number of living genera. Malacopterous fishes now appear. Reptiles are still mostly of extinct types—Pterosauria, Ichthyosauria, Dinosauria, &c; but among birds we find some allied to existing waders, as well as the curious extinct group of Odontornithes, or toothed birds (Marsh, in *American Jour. of Science and Arts*, vol. x 1875.)

When we pass over the great chasm of time which separates the Mesozoic from the Cainozoic or Tertiary period, we at once come upon a host of new forms closely resembling those which now live upon the earth. The majority of living genera of Mollusca now appear, with a gradually increasing proportion of living species, as we pass from the Eocene to Miocene and Pliocene times; the highest forms of Crustacea are plentiful; Insecta of all orders, and almost all of living genera, abound; fishes of

living genera gradually appear, and true snakes (*Ophidia*) are first met with. Among birds, all the existing orders, many families, and some living genera appear in the Miocene period. Mammalia, however, exhibit the most surprising advance. Ancestral forms of all the existing orders are found in the Eocene formation; in the Miocene, most living families are well developed; while in the Pliocene and post-Pliocene deposits we find the genera and species for the most part closely resembling those that still

inhabit the earth. The following diagrammatic table will enable the reader better to comprehend the main facts which we have here endeavoured to set forth. It comprises only the larger or more important groups of animals, and of each of these the known range in time is indicated by a thick line. It has not been attempted to show the breaks which occur in our knowledge of the range of a group, since no one now doubts that where any type appears in two remote periods it must have been in existence during the whole

intervening period, although we may have no record of it. Neither has it been attempted to indicate the abundance or scarcity of the group in each period, this being a detail suited only to a special treatment of science of palæontology. It must also be remembered that it is often impossible for us to determine whether the increased prevalence of fossil remains of a particular group is due to a really greater development of the animals, or only to more favourable conditions for their preservation and discovery.

On considering the successive phases of animal life presented to us by the fossil remains preserved in the rocks, we cannot help perceiving that there has been on the whole a steady advance in organization and an increase in variety and complexity, from the earliest geological periods to the present day. Thus the oldest known fossil belongs to the lowest type of animal life—the Protozoa. Then we have the lower forms of Molluscs,—Brachiopoda and Pteropoda—followed by the Cephalopoda and Gasteropoda.

The Entomostraca, Trilobites, and Phyllopoas, come before the higher Decapod Crustacea, and of these the highest form—the Brachyura—appears much the latest. Again, all the aquatic classes of invertebrates appear in abundance before the earliest of the aquatic vertebrates—fishes—make their appearance. These are followed by Amphibia, and later still by true reptiles. The more highly organized birds and mammals appear later, and almost simultaneously.

There are, it is true, many anomalies, the higher and more complex organisms in some of the minor groups appearing before the lower; but these cases generally occur in the oldest (Palæozoic) formations, where, on the principles already laid down, the record must be necessarily more imperfect. In the Mesozoic and Tertiary formations the succession is more regular, and accords better with the grade of organization of the several groups, and the best examples of this are to be found among the Mammalia of the Tertiary period, the series of which is, in some groups, tolerably complete. Thus, among the Ungulata we find in the Eocene deposits the remains of a number of generalized types, such as the *Palæotherium*, allied to the horse, tapir, and rhinoceros; *Lophiodon*, an ancestral form of tapir; *Anoplotherium*, intermediate between pigs and ruminants; *Phiolophus*, allied to the tapir and horse; and the North American *Orohippus*, a remote ancestor of the horse¹. This last-named animal, Professor Marsh tells us, had four toes in front and three behind, and was no larger than a fox, yet an almost perfect series can be traced, in succeeding deposits, of animals with smaller and smaller lateral toes, the size and speed increasing, the head and neck becoming longer, the canine teeth decreasing in size, the bones of the fore-arm consolidating, and other modifications successively taking place till we come, by almost imperceptible gradations, to an animal so completely unlike the one we started from as our existing horse. In like manner we have the extinct families of the *Anoplotheriæ*, *Anthracotheriæ*, *Oreodontiæ*, and many groups of doubtful affinities, which seem to be ancestral forms from which sprung the swine, hippopotami, and all our ruminants. These become more specialized in the Miocene, but it is only in the later Miocene and Pliocene that we find true deer, canals, oxen, and antelopes. So, the oldest form of the Carnivora, found in the very lowest bed of the Eocene formation, is the *Arctocyon*, one of the generalized types which cannot be referred to any existing family. A little later the *Canidae* and *Fuerridae* appear, while the more specialized and highly organized *Felidae* are not found till the Miocene period. To exhibit in detail the succession and affinities of extinct forms is the province of palæontology; we can here only give the chief facts in outline, which however are sufficient to render intelligible the great principle which almost all palæontologists have arrived at, viz.—that extinct animals exhibit more generalized structures, as compared with the more specialized structures of recent animals (Owen's *Palæontology*, p. 406).

Having now laid before our readers a sketch of the more important facts of the distribution of animals in time, we will conclude this branch of our subject with a brief discussion of its bearing on the theory of evolution, and on the imperfection of the geological record. The abruptness with which animal remains in considerable variety first appear in very ancient deposits is undoubtedly a most remarkable phenomenon. With the exception of the still somewhat doubtful *Lozoon*, the vast series of Laurentian rocks have produced no fossils. But the moment we enter

the Cambrian formation we at once meet with a somewhat extensive series of complex and varied organisms. Besides the Brachiopoda we have Pteropoda, a by no means low form of Mollusca; while the Trilobites and Phyllopoas exhibit a considerable amount of specialization. Almost as early, we have sponges, annelids, star-fishes, cucumbers, lamellibranchiata, and Orthoceratidæ,—a variety of divergent and complex types, which, on any theory of development, indicates a very long succession of ancestral forms. But we must also bear in mind that the few fossiliferous deposits of this early age cannot possibly have made us acquainted with more than a minute fraction of the organisms which then existed on the whole earth. We are therefore compelled to believe that the absence of all remains of more ancient forms of life in the pre-Cambrian rocks is fallacious, and due solely to no record of them having been preserved, or, if preserved, to their not having been discovered by us. This conclusion is supported by analogous facts which occur and recur in every succeeding formation. The highly specialized corals and fishes of the Silurian rocks must have had ancestors in Cambrian times of which we know nothing; and the sudden appearance of perfectly developed winged insects in the Devonian formation, plainly tells us that during countless unrecorded ages various lower forms of terrestrial Annulosa must have been gradually developing into these marvellously specialized types,—yet these lower forms (Myriapods, &c.) only appear as fossils in the succeeding Carboniferous formation. Such highly organized insects also imply the existence of vegetation, and, by analogy, of other terrestrial animals of an equally high grade of development. Hence the discovery of these winged insects (which can, with great probability, be classed in one of our existing orders—the Neuroptera) opens up to the imagination of the evolutionist a wonderful picture, far removed from the dreary waste of waters which was once thought to characterize the epoch of the early Palæozoic formations. Geologists, indeed, have long taught us that the vast piles of sedimentary rocks of the Silurian, Cambrian, and even the Laurentian period necessarily implied the co-existence of extensive continents or islands whose denudation could alone produce them, and now the theory of evolution enables us to clothe these ancient lands with vegetation and people them with animal life, since it is only thus that we can find space and time sufficient for the development of the wonderful insects, the land shells, the Amphibia, and the reptiles,—all of which appear suddenly, in perfect and completely organized forms, in some parts of the Palæozoic series. When we consider that we have indications of the existence during the Carboniferous age of such diversified and highly specialized types of Annulosa as myriapods, spiders, cockroaches, locusts, dragon-flies, ephemeras, lamellicorn-beetles, and bombyceiform moths,—so that it is highly probable that no fresh ordinal type of insects has originated during all succeeding ages, and when we further consider that all these are specialized modifications of simple Annulosa, we shall be forced to conclude that, whatever time may have elapsed from that epoch to the present day, a far longer time is required, antecedent to the Carboniferous period, to allow of the development of such varied terrestrial forms of life.

As bearing upon this question it is important to consider how scattered and fragmentary are the few indications of mammalian life older than those of the Tertiary period. Sir Charles Lyell tells us, that up to the beginning of the present century it was a generally received dogma in geology that the Mammalia had not been created before the Tertiary period, and the first discovery of the jaw-bone of a small Marsupial in the lower Oolite caused as much sensation as would now be excited by our finding a

¹ A still more remote ancestral form *Eohippus* has since been discovered in the lowest Eocene deposits of West America. See Huxley's *American Addresses*, p. 90.

Secondary monkey, or (we may add) a Silurian bird or mammal. The following table is abbreviated from that in the *Students' Elements* (p. 315), as it is well calculated to show how scanty and accidental is our knowledge, and how necessarily imperfect must be the geological record in still earlier periods.

For an account of the characteristics of these small animals, and for some details of their history, we refer the reader to Sir Charles Lyell's work; it is here only necessary to state the circumstances under which these remains have been preserved and discovered. Fossil remains of land animals are, of course, rarely found except in lacustrine or estuarine deposits, and these are often entirely wanting throughout extensive geological formations. But even where such fossiliferous beds occur, the conditions favourable to the preservation of small Mammalia are exceedingly rare,—the entire series of fresh-water Wealden beds having yielded no trace of them, although we are quite certain that they were then both varied and abundant. Even more remarkable is the fact that the whole 25 species of Purbeck mammals, belonging to 10 genera, were obtained from a single stratum only a few inches thick, and from an area of less than 500 square yards. Yet these small animals must have abounded at this period; and it is impossible to believe that anything but a most imperfect and fractional representation of the mammalian fauna of the country could have been gathered into this narrow graveyard. But this thin stratum occurs amid a mass of fresh-water deposits 160 feet thick, the whole of which have been thoroughly and systematically examined by the officers of the Geological Survey of Great Britain; and though many of the layers contain remains of land organisms—plants, insects, and land-shells—no other part of the whole series has yielded a single fragment of mammalian remains! Having this striking example of the worthlessness of negative evidence, it behoves us to be cautious of rejecting any legitimate conclusions from the facts in our possession, on account of the absence of the direct evidence of fossil remains. The varied and highly-

developed Mammalia of the Eocene period really necessitate (to the evolutionist) the long-continued previous existence of this class of animals, and the discovery of isolated species in the Oolite and Trias would (had it been delayed to our time) have been but a confirmation of theoretical deductions.

In his anniversary address to the Geological Society in 1870, Professor Huxley adduces a number of special cases showing that, on the theory of development, almost all the higher forms of life must have existed during the Palæozoic period. Thus, from the fact that almost the whole of the Tertiary period has been required to convert the ancestral *Oryxippus* into the existing horse, he believes that, in order to have time for the much greater change of the ancestral Ungulata into the two great divisions of Perissodactyles and Artiodactyles (of which change there is no trace even among the earliest Eocene Mammals), we should require a large portion, if not the whole, of the Mesozoic period. Another case is furnished by the bats and Cetacea, which occur fully developed in the Eocene formation, and these would have required still more time for their modification out of ancestral Insectivora and Carnivora. The Marsupials of the Trias, again, were already differentiated into herbivorous and carnivorous forms, so that on the lowest estimate we must place the common ancestor of the Mammalia very far back in Palæozoic times. Reptiles furnish evidence of the same character. Professor Huxley says, "If the very small differences which are observable between the *Crocodylia* of the older Mesozoic formations and those of the present day furnish any sort of approximation towards an estimate of the average rate of change among the *Sauropsida*, it is almost appalling to reflect how far back in Palæozoic times we must go before we can hope to arrive at that common stock from which the *Crocodylia*, *Lacertilia*, *Ornithoscelida*, and *Plesiosauria*, which had attained so great a development in the Triassic epoch, must have been derived." And if to these indications we add the appearance of two orders of fishes—Elasmobranchs and Ganoids—in the Silurian period, we shall be compelled to place the origin of the whole vertebrate stock at an epoch far beyond that of the lowest fossiliferous rocks of the Cambrian series.

If, then, we bear in mind the very early appearance of so many highly complex organisms, representing all the great types of animal life—almost all the great invertebrate groups in the Cambrian and Lower Silurian, with many Vertebrata and almost all forms of Insecta in the Devonian and Carboniferous periods,—while a large number of these have hardly increased in complexity of organization down to our times, we shall be prepared to admit the extreme probability of Mr Darwin's view, that "before the lowest Cambrian stratum was deposited, long periods elapsed, as long as, or probably far longer, than the whole interval from the Cambrian ago to the present day; and that during these vast periods the world swarmed with living creatures" (*Origin of Species*, 6th ed p. 286).

Professor Ramsay has recently expressed analogous views, founded on an extensive survey of the whole series of geological formations. In a paper "On the comparative value of certain Geological Ages (or Groups of Formations) considered as items of Geological Time" (*Proceedings of the Royal Society*, 1874, p. 334), he says—speaking of the abundant and well-developed fauna of the Cambrian period, a sketch of which we have given at p. 282:—"In this earliest known varied life we find no evidence of its having lived near the beginning of the zoological series. In a broad sense, compared with what must have gone before both biologically and physically, all the phenomena connected with this old period seem, to my mind, to be of quite a recent description; and the climates of seas and lands were of the very same kind as those the world enjoys at the present day."

It thus appears that the general geological principle with which we started, of the more complete destruction by denudation and metamorphism of the earlier as compared with the later records of life upon the earth, receives ample support in the apparently sudden appearance of whole groups of complex and specialized forms in some of the earliest rocks, while the general imperfection of the geological record is made manifest by such facts as the very few and isolated remains of Mammalia in the Mesozoic rocks, although we know they must have existed in abundance throughout the whole Secondary and much of the Palæozoic periods. The great lesson we have to learn from the facts of palæontology is, that its negative evidence is at the best of but little value, but when this negative evidence is opposed to general principles established upon a wide basis of physical and biological research, it becomes absolutely worthless. Just in proportion as the series of fossiliferous deposits is more complete, and the fossil remains more abundant and varied, does the evidence for evolution and progressive development become more powerful. The difficulties are almost wholly dependent on incomplete knowledge, and on the assumption (which we have endeavoured to show is entirely unfounded) that the earliest traces of the fossil remains of any animal type which have been discovered can give, even approximately, the period of its first appearance upon the earth.

We find, then, that just as a study of the distribution of animals in space enables us to learn much of the immediately preceding condition of the earth's surface, and especially of the recent changes of land and water,—so a study of the distribution of animals in time, when aided by the modern theory of evolution, gives us some knowledge of the physical condition and life of the earth in times beyond the reach even of geological history. (A. R. W.)

DISTRIBUTION OF VEGETABLE LIFE.

The literature in which the immense multitude of distinct kinds of plants which are dispersed over the earth's surface and form its vegetation has so far been described has necessarily been adapted to the divisions of political geography. The causes which have brought about the formation of such divisions have rarely, however, had anything in common with those which have determined the characteristic features, whether superficial or profound, of the floras of different countries. The great mass of catalogues and descriptive enumerations of the plants of such countries, the boundaries of which are for the most part quite artificial, are therefore ill adapted for bringing out any general conclusions as to the mode in which plants are distributed. It is only by making some kind of analysis of the often heterogeneous contents of such catalogues, and piecing together the results obtained from different sources, that any clue can be obtained to the approximate lines of demarcation of floras which are really naturally limited and characterized. The process is, however, enormously laborious, and, even apart from that, must for a long time to come be exceedingly imperfect in its application, owing to the immense tracts of land—and those with the most varied and copious vegetation—of the natural products of which our knowledge is still most defective.

Numerous attempts have, however, been made, notwithstanding the difficulty of the task, to map out the earth's surface into "regions of vegetation." The real significance of these regions will, of course, entirely depend upon the principles which have been relied upon in forming them. And in this respect the progress of geographical botany has been exactly similar to that of classification. The characteristic distinctions which were first seized upon in

either case proved on closer scrutiny to be superficial, and to bring about merely artificial and arbitrary assemblages. The doctrine of evolution has in fact effected the same revolution in both, it has shown in the one that community of descent is the real meaning of a natural classification, it has shown in the other that community of origin is the real key to geographical distribution.

Most of the writers on geographical botany have been content to set aside all considerations of origin and history in attempting to define the limits of botanical regions. They have not attempted to see in the peculiar features which such regions may possess anything more than adaptations to physical conditions working on plants created in great measure where they are found. Although, therefore, the literature of geographical botany has been useful in enabling the reader to realize the local features—the colouring, if one may so express it—of particular countries, the facts have hitherto been presented in a form void of any true significance. And these remarks apply to the system of Schouw (1833), which has been much employed, partially to that of De Candolle, and conspicuously to that more recently published by Grisebach. It is to the writings of Darwin, Hooker, Asa Gray, and Bentham that we must look for a real insight into the origin and dispersion of floras, and for the real causes of the existing distribution of plant life.

The first attempt to review the whole subject of plant-distribution from the modern point of view—afforded by evolution—is due to Bentham, who made it the subject of a presidential address delivered to the Linnean Society in 1869. Bentham's conclusions are based upon the experience of a long life devoted to systematic botany, and will probably always hold a fundamental position in the study of the subject; at any rate for some time to come, until the distribution of a large number of subordinate groups has been carefully worked out, the main points established by him are not likely to be materially modified.

The general *facies* of vegetation is obviously largely affected by purely physical causes. In the polar regions, arboreal and even shrubby plants become incapable of existence, and only small perennials which are safely covered up by snow during the long winter are able in the brief summer to expand their flowers and ripen their seeds. Putting aside for the moment the severances effected by large bodies of water and mountain chains, it is easy to see that the vegetation of the earth must have always been separable into three great latitudinal zones, two belonging to the north and south hemispheres respectively, and one dividing them lying between the tropics. The constituents of the vegetation of these zones must always have had a certain homogeneity; very considerable divergences, however, have grown up within the zones themselves, owing to circumstances of geographical isolation. Even without these, distance alone, independently of isolation, would in time be sufficient to effect it. It is also obvious that the precise northern and southern limitations of such hypothetical zones must have varied with secular changes in the earth's climate, and when these changes have taken place over a broken configuration of land and sea, the intermixture of diverse floras must necessarily have become very complicated.

Underlying, however, the tangled fabric of the earth's existing floral covering, we may agree with Bentham¹ in recognizing the existence of three tolerably ancient floras—the Northern, the Tropical, and the Southern.

I. The Northern is characterized by its needle-leaved Coniferæ, its catkin-bearing *Amentaceæ* and other forest

¹ Presidential address to Linnean Society, 1869, p. 18.

trees deciduous in winter, and its vast assemblage of herbaceous types, *Ranunculaceæ*, *Cruciferae*, &c. These spread over Europe, northern and central Asia, and great part of North America.

II The Southern is broken up into numerous divergent floras. Their original connection is now traceable only in the common possession by two or more of them of large characteristic groups, such as *Restiaceæ*, *Proteaceæ*, *Diosmeæ*, &c., the subordinate divisions of which have been locally specialized. To this belong the floras of extra-tropical South America, South Africa, and Australia with New Zealand, to which must probably be added an area borrowed from the northern hemisphere in Mexico and California.

III. The Tropical is characterized by the predominance of mostly evergreen arborescent *Polypetalæ* (*Anonaceæ*, *Meliaceæ*, *Leguminosæ*, &c.), and gigantic Monocotyledons, of which *Palus*, *Scitamineæ*, and *Bambuseæ* amongst grasses are especially striking.

I THE NORTHERN FLORA.—This has been long divided into that of Old and New World by the severance of North America from Northern Asia, and by the barrier to an interchange of vegetation in the upheaval of the Rocky Mountain range. Nevertheless its marked continuity (with only a gradual east and west change in the arctic regions, but an increased divergency southwards) requires it to be treated as a whole. The Old and New World divisions of this flora, which, no doubt, began to diverge from the mere influence of distance, have now had that divergence immensely increased by isolation. According to Lesquereux,¹ the essential types of the present arborescent flora of North America are indicated in the Cretaceous rocks of that country, and become more distinct and numerous in the Tertiary, and he believes that the origin of the existing American flora is American. The analogy between the Miocene flora of Central Europe and the present North American flora is unquestioned, and is greater than between the same fossil flora and that now existing in Europe. Lesquereux's conclusion is that the American element in the vegetation of Miocene Europe was derivative, and this is one of many illustrations of the curious observation of Asa Gray that plants have in general a greater tendency to migrate from east to west than from west to east. This Miocene flora was, however, gradually driven back again, and it is only as we travel from Europe to the East that we gradually find its traces getting stronger and stronger. Thus, as Oliver² has pointed out, in passing from the Mediterranean to the Levant, the Caucasus, and Persia, we meet with living representatives of the Miocene genera *Chamaecrops*, *Platanus*, *Liquidambar*, *Pterocarya*, *Juglans*, &c. Along the Himalayas and through China we trace other Miocene genera, Japan forming part of the same botanical region as Eastern Asia. Among the remarkable existing North American types which may be mentioned as reappearing in the Himalayas and Japan are *Aralia quinquefolia*, *Phryma leptostachya*, and *Trillium erectum*. One of the most interesting additional facts which has recently come to light is the occurrence of a species of tulip tree (*Liriodendron*) in Central China, which genus, though a member of the European Miocene flora, has in recent times been regarded exclusively characteristic of America.³ With respect to other American genera which are not necessarily part of the Miocene flora, the same general principle holds good. Bentham remarks, that while some, like *Astragalus*, have multiplied largely in both continents, "other genera, like *Eupatorium*, *Aster*, *Phlox*, *Solanum*, &c., very nume-

rously represented in America, have transmitted or produced a smaller number in Eastern Asia, gradually diminishing westward till they disappear altogether or attain Western Europe in single species but little altered from American ones."⁴ The Europeo-Asiatic genera, on the other hand, such as *Cruciferae*, *Umbelliferae*, &c., which are so dominant a feature in the existing Old World Northern flora, appear "to have left but few representatives in America, and those much more modified than the American races left in Asia."

Besides the internal migrations of the various constituents of the great Northern flora, its boundaries have been changed longitudinally under the influence of secular variations of climate alluded to above. The nature of these cannot be better summed up than in the words of Bentham:—⁵

"Where the chief portion of this great northern flora originated, and whether it may be best termed Scandinavian, or North Asiatic, or Caucasian, is a question for the determining of which we have little or no data; but, as observed by Hooker, it is probably one of the most ancient and widest spread, having at different epochs travelled over a great part of the globe. Shown by the researches of Lesquereux, as well as by the recent ones of Heer and others, to have extended far north during the warmer preglacial times, it must have been slowly driven southwards as the glacial epoch came on, and either then, or at some one or more other periods, have been for a time continuous, in two lines at least, into the southern hemisphere, for it has left traces still discernible, especially in its herbaceous and mountain forms, in the mountains of tropical Asia, down at least to the Indian peninsula, and westward to the Abyssinian and Cameroons mountains of Africa, and, again, down the Andes to the extreme south of America, where it is still luxuriant, and in a less degree in New Zealand, Tasmania, and Victoria. In all these migrations, whilst retaining a general identity, the flora must have undergone continual changes, losing species or other races of limited areas and propagation as their habitations became unfit for them, and gradually forming new ones when favoured by long-continued isolation or other requisite conditions."

The Northern flora has further undergone a specialization into three secondary floras, due to the combined influence of physical and genetic causes.

1 The Arctic-alpine flora ("consisting chiefly of plants of small stature, slow growth, and limited means of dispersion, compensated by long lives and great powers of endurance") is perhaps the most interesting of the three subdivisions, both because in its arctic aspect it reduces the divergence of the Old and New World divisions of the Northern flora to a minimum, and more especially on account of the great interest which attaches to the problem of its scattered alpine outliers. With regard to the first point, Hooker found that estimating the whole Arctic flora at 762 species, Arctic East America possessed 379, of which 269 were common to Scandinavia. Of the whole flora 616 species are found in Arctic Europe, and of these 586 are Scandinavian, and this leads Hooker to the striking observation that "the Scandinavian flora is present in every latitude of the globe, and is the only one that is so."⁶ Christ objects to Hooker's giving the title of Scandinavian to the Arctic flora, but we must agree with Bentham⁷ that Scandinavia "would, according to older rules, have been regarded as the centre of creation for the arctic lands, and may now be termed the chief centre of preservation within the arctic circle, owing perhaps partly to its more broken conformation, and partly to that warmer climate which, while it now admits species which Christ objects to being included in the Arctic flora, was during the glacial period a means of preservation of some colder species which were everywhere else expelled or destroyed."

Just as at present the Arctic is more homogeneous than

⁷ Presidential address, 1869, p. 21.

the more southern divisions of the Northern flora, so we may infer that towards the close of the Tertiary epoch the continuous circumpolar land was covered with a vegetation also largely composed of identical plants but adapted to a warmer climate. As the climate became less warm there would commence a migration southwards, which would result in the modified descendants of these plants being now blended with the vegetation of Central Europe and the United States. As the glacial period gradually advanced, "the tropical plants and animals will have retreated from both sides towards the equator, followed in the rear by the temperate productions, and these by the arctic."¹ When the climate of the earth again ameliorated, the migration took place in the reverse direction, and in this way mountain ranges became the havens of refuge of fragments of the original arctic floras which were exterminated on the lowlands. Even the equatorial region ceased to be a barrier during the glacial period, and to migration at that time must be attributed the survival of arctic forms in the south temperate zone. The southern migration of the Arctic flora does not appear to have taken place in one continuous wave. Thus, as Bentham points out,² "many facts showed separate communications between the north and each of the three chains of the Pyrenees, the Alps, and the Himalayas, whilst these three gave little evidence of any lateral communication of their respective alpine vegetations."

The fact that the migration southwards and remigration northwards of the Arctic flora took place along parallels of longitude, accounts for some of its existing peculiarities. Hooker explains in this way the comparative poverty of the Greenland flora.³

"If it be granted that the polar area was once occupied by the Scandinavian flora, and that the cold of the glacial epoch did drive this vegetation southwards, it is evident that the Greenland individuals, from being confined to a peninsula, would be exposed to very different conditions to those of the great continents. In Greenland many species would, as it were, be driven into the sea, that is exterminated, and the survivors would be confined to the southern portion of the peninsula, and not there being brought into competition with other types, there could be no struggle for life amongst their progeny, and consequently no selection of better adapted varieties. On the return of heat, these survivors would simply travel northwards unaccompanied by the plants of any other country."

"In Arctic America and Asia, on the other hand, where there was a free southern extension and dilatation of land for the same Scandinavian plants to occupy, these would multiply enormously in individuals, branching off into varieties and sub-species, and occupy a larger area the further south they were driven; and none need be altogether lost in the southern migration over plains, though many would in the struggle that ensued when they reached the mountains of those continents and were brought into competition with the alpine plants, which the same cold had caused to descend to the plains. Hence, on the return of warmth, many more Scandinavian species would return to Arctic America and Asia than survived in Greenland; some would be changed in form, because only the favoured varieties could have survived the struggle; some of the alpine Siberian and Rocky Mountain species would accompany them to the arctic zone; while many arctic species would ascend those mountains, accompanying the alpine species in their reascend."

The Arctic-alpine flora is obviously in its present condition a composite one. Portions of the Northern flora, probably originally very distinctly characterized, became adapted to the peculiar physical conditions of high mountain ranges and of the extreme north. The gradual deterioration of the climate brought the alpine flora, to the lowlands and the arctic flora southwards till they intermingled. When they again returned to their original territories they were so far changed that each gave the other some new members, while both had experienced many losses.

A. de Candolle has very ingeniously applied the general principles laid down above to the detailed explanation of the distribution of the flora of the Alps themselves. The following is a brief summary of his conclusions:—⁴

The valleys and groups of mountains which have at present a maximum of rare species and the most varied flora belong to districts on which the glaciers disappeared earliest. On the other hand, where the duration of snows and glaciers has been most prolonged, the existing flora is poor. From a variety of causes which A. de Candolle enumerates, it seems probable that the southern and eastern glaciers of the Alps were of smaller extent than the northern, and would consequently be the soonest to retreat. We have consequently the curious fact that some of the most ancient fragments of the alpine flora are now only to be found on the southern slopes of the Alps. This is the case with species of *Primula*, *Pedicularis*, and *Oxytropis*, which exist neither in the interior of Switzerland, nor in the north of Europe. But it is easy to see that, like the other members of this flora, they were driven south during the glacial period, returning as the mountains reappeared from underneath their snowy covering, while on the northern side they were in great measure exterminated. A. de Candolle points out as a fact in further confirmation that the Alpine species of *Campanula*, peculiar to Mont Cenis and the Simplon and neighbouring valleys, are not related to the Arctic species, but find their nearest allies in Greece, Asia Minor, and the Himalaya.

A further indication of the great antiquity of the Arctic-alpine flora is afforded by the fact of its absence in the comparatively modern volcanic mountains of France. "The Monts d'Or and Cantal, at an elevation of 6000 feet, offer scarcely any of those alpine and sub-alpine plants which abound at the same or lower elevations in the Pyrenees on the one side, and in the Alps on the other, as well as in the British and Scandinavian mountains to the north."⁵ Hooker, however, points out that the absence of the alpine-arctic flora in Auvergne may be due to severe glaciation rather than to its absence (see *Nature*, Nov. 11, 1875, pp. 31, 32).

2 The *Intermediate* or *Temperate* flora is best described in the words of Bentham as

"A mongrel vegetation of mixed origin, including a large proportion of species of the most extended geographical range, with a very few local ones, and those chiefly in the extreme west. The majority, whether trees, shrubs, or herbs, are plants of comparatively rapid growth, very prolific, endowed with great facilities for dispersion, and constitutions capable of adapting themselves to a great variety of physical and climatological conditions. They are great travellers, and soon take possession of any district left denuded by the abandonment of cultivation. To the great majority of them no primeval antiquity can be ascribed in Central or Western Europe; ⁶ they appear to have come from the east, a considerable number perhaps from Western Asia, where their types appear to be more varied, but many also must have made half the tour of the globe. Large American genera have sent out offshoots into Eastern Asia, which gradually diminishing in number of species, and sometimes slightly modifying their character, have spread over the whole of Asia, and invaded almost every part of Europe. These plants are, moreover, generally continuous, that is, interrupted only by intervals which under present condition they have means of crossing; and they are abundant in individuals, ascending in latitude and elevation, or descending to the south, until checked in their career by competing species, better enabled to endure the increasing rigour or the searching drought of the respective climates. Many of them will even assume slight modifications suited to their exceptional circumstances, and it is then as difficult to separate them from the genuine northern or southern floras as in many cases to give plausible grounds for establishing the precise origin of individual species."⁷

The peat deposits of Denmark tell an unmistakable tale of the gradual advance of successive waves of vegetation from the south-east. The Scotch fir was once abundant within

⁴ These are given in greater fulness in *Nature*, April 27, 1876, p. 516.

⁵ Bentham, *Nat. Hist. Rev.*, 1864, p. 370.

⁶ Martins, however, considers that many of the plants of the existing south of Europe flora are of great antiquity in their present situations; thus the *Oleander* (*Nerium Oleander*) has been found in deposits from the Eocene upwards (*Mém. de l'Acad. d. S. de Montpellier*, ix. p. 95).

⁷ *Nat. Hist. Rev.*, 1864, pp. 370, 371.

the Roman period in the Danish islands, but is now extinct, it was succeeded by the sessile-fruited oak, to be in turn supplanted by the pedunculated form of the same tree, associated with the alder, birch, and hazel. The oak is now almost supplanted by the beech.¹ According to Areschoug, the original post-glacial flora of Scandinavia has retreated to the north, and is probably still retreating, while the flora of central and south Scandinavia consists of "an eastern and north-eastern vegetation, which spread into Europe after the glacial period and before the beech tree had invaded Sweden, with the admixture of more southern species, which, with the beech, have since penetrated into Sweden through Denmark."² The beech and the chestnut occur in Japan, and, as far as Europe is concerned, there is good reason to regard their origin as Eastern.

As already pointed out, the American element in the European flora suffered severely during the glacial period, and has never since recovered itself. Japan, however, appeared to have been a great centre of preservation, and hence the numerous points of contact which its flora presents with that of the North American continent. In the New World itself, the continuity of the pre-glacial and post-glacial temperate floras has been better preserved. The following passage from an address of Asa Gray's may be quoted as giving its history in a concise form:—

He "considered that the present vegetation or its proximate ancestry must have occupied the arctic and sub-arctic regions in Pliocene times, and that it had been gradually pushed southward as the temperature lowered and the glaciation advanced, even beyond its present habitation; that plants of the same stock and kindred probably ranging round the arctic zone as the present arctic species do, made their forced migration southwards upon widely different longitudes, and receded more or less as the climate grew warmer, that the general difference of climate which marks the eastern and western sides of the continents,—the one extreme, the other mean,—was doubtless even then established, so that the same species and the same sorts of species would be likely to secure and retain foothold in the similar climates of Japan and the Atlantic United States, but not in intermediate regions of different distribution of heat and moisture; so that different species of the same genus, as in *Torreya*, or different genera of the same group as redwood, *Taxodium* and *Glyptostrobus*, or different associations of forest-trees, might establish themselves each in the region best suited to the particular requirements, while they would fail to do so in any other."³

The west of Europe possesses the remains of a local and probably more ancient flora of very great interest, characterized by Gorse, and allied shrubby *Leguminosae*, Heaths, Lobelias, Sibthorpias, &c. These are closely checked in any tendency towards eastern dispersion by the severity of the winter climate away from the ameliorating influence of the sea. The probability of a southern extra-tropical connection of this peculiar element in the Northern flora will be adverted to hereafter.

The flora of the British Isles is in many respects interesting; it is in its main features an extension of the Germanic area of the temperate flora with the presence of the western element above alluded to distinctly marked on the south-western coasts. *Eriocaulon septangulare* is an anomalous constituent, being limited to Ireland and a few islets on the western side of North Britain, and being otherwise an American and not a European species.⁴ Its presence can hardly be explained except by the agency of migratory birds.

3. The *Mediterraneo-Caucasian* flora, like the Arctic-alpine, contrasts in the most marked way with the temperate.

"By far the richest and most diversified in species [it comprises six-sevenths of the European flora], it is also remarkable for the

great variations centering round individual types, as well as for the very restricted areas occupied by a number of the most marked species; the limits are not to be accounted for by any physical peculiarities we are acquainted with, nor perhaps to be otherwise explained than by a supposition of very great antiquity."

Eastward of the Caucasus this remarkable flora dies away, reaching its eastern limit in Scinde, and the temperate flora of Asia is only separated from the tropical by the Himalayas. Southwards its progress is arrested by the arid zone formed by the African and Arabian deserts.⁵ As in the case of the Arctic flora, traces still exist of its former southern extension under the influence of a colder terrestrial climate. *Adenocarpus*, a characteristic Mediterranean genus, is represented by an identical species on Kalima Njaro, near the equator, and on the Cameroons mountains, 2000 miles distant on the opposite and western side of the African continent.⁶

II. THE SOUTHERN FLORA.—The Southern flora exhibits relations much more complex than those presented by the Northern. Instead of extending over large continental areas it is now dismembered into isolated groups scattered over the southern hemisphere, and in both the New and Old World sending northern extensions across the equator.

Five types may be briefly described, the definition of all but the first being taken from Bentham —⁷

1. The *Antarctic-alpine* flora is the complement of the *Arctic-alpine*. It consists mainly of some widely distributed northern genera such as *Carex*, *Poa*, *Ranunculus*, &c., with alpine types of strictly south temperate genera characteristic of the respective localities. Hooker describes it as possessing "decided Australian representatives in *Centrolepideæ* and *Stylidiæ*, commencing in Fuegia, the Falklands, and Lord Auckland's and Campbell's groups, re-appearing in the Alps of New Zealand, Tasmania, and Australia, and disappearing under the equator, on the Alps of Bornco."⁸

2. The *Australian* flora is "almost endemic, showing some slight connection with the New Zealand, and a few remains of former ramifications northward to some parts of the Indian Archipelago, a very few species, perhaps of modern introduction, extending to China and Japan" Bentham⁹ conclusively dismisses Unger's theory of the former extension of the Australian flora into Europe in Eocene times.

3. The *Andine* flora, characterized by a large number of distinct genera, *Fuchsia*, *Gaultheria*, *Calceolaria*, ranges more or less along the whole chain, "penetrating far northwards in Western America, throwing off a few branches into Eastern Asia, and at its southern extremity crossing over to New Zealand, and in smaller numbers to Tasmania, and the mountains of Victoria."¹⁰

4. The *Mexico-Californian* flora is "represented at great distances by closely allied species of small distinct genera—in Mexico and California, in the Argentine states, and in S. Africa or Australia."¹¹

5. The *S African* flora is "perhaps the richest known in proportion to its extent, and remarkably varied within its narrow limits" Its connection with other floras is very slight. That with Australia, alluded to at the commencement, does not extend beyond groups of the highest order (in the *Proteaceæ* not merely the species but the genera

have become geographical); and, as mentioned above, there are a few scattered species, representing the South African flora, in extra-tropical South America. There are, however, two offshoots in a northern direction. The remarkable West European flora, already referred to, possesses species of *Erica*, shrubby *Leguminosæ*, *Lobelia*, *Gladiolus*, &c., "more nearly added to corresponding Cape species than they are to each other." The other extension is to Eastern Africa. The sub-alpine vegetation of Kilima Njaro is distinctly South African, and Hooker suggests "the probability of the South African flora being represented all along the highlands of Eastern Africa, from Natal to Abyssinia; and further, seeing that most of the South African plants found in the Cameroons are also natives of Abyssinia, it would appear probable that the migration of these to the Cameroons was by and through Abyssinia."¹ The further suggestion that this may have been the path travelled by the West European extension of the South African flora is sufficiently obvious.

The amount of agreement amongst these scattered fragments of a great flora points necessarily to a state of things when the lands they now occupy were at one time or other in more or less of intimate connection. The amount of differentiation between the floras, and the fact that agreement has to be sought in groups of high rather than of small rank, points equally to the fact that such connections must have been far from recent.² The detailed study of separate groups leads by another path to the same result, and, as a good instance of the new phase into which taxonomic botany is entering in the light of the study of geographical distribution, reference may be particularly made to Bentham's important investigation into the past history and migrations of the *Campanulaceæ*.³

III. THE TROPICAL FLORA.—This is still perhaps too imperfectly known to admit of any very plausible generalization. It obviously presents three great subdivisions.

1. The *Indo-Malayan* extends from the Himalayas to north-east Australia and Japan. In the latter country it meets the northern temperate flora, from which in India it is sharply divided by the Himalayas.

2. The *American* is still a perfect mine of unexplored botanical wealth. Bentham remarks—"No general comparison of Asiatic and American tropical vegetation can therefore be made without immense labour of detail. As far as we know, however, the resemblance between them is only in some of the races of a higher grade, natural orders and comprehensive genera; the smaller genera and species, and many even of the higher ones, are totally different; or if a few species are identical, they are generally, if woody or arborescent such as *Entada*, *Gyrocarpus*, &c., wholly or partially maritime, and may have traversed the ocean during its present configuration, or if herbaceous widely, spread weeds still more likely to be spread all round the tropics under existing conditions."⁴ There are, however, some extraordinary points of connection between the tropical floras of the Old and New Worlds, to which there is at present scarcely any clue. Thus *Ternstroemia emarginata*, endemic to Ceylon, so closely resembles the Brazilian *Ternstroemia cuneifolia* as to be barely distinguishable.

3. The *African* tropical flora is probably the most

imperfectly known of any. Bentham considers it as of great antiquity, and as having preserved large numbers of persistent types from which races "have widely diverged in Asia or America, or in both." He further remarks that "as our knowledge of the vegetation of tropical Africa has increased, we have discovered a greater number of Asiatic types; but still there are, even in the interior, a certain number of American ones, offering a problem the solution of which has scarcely been attempted."⁵

In *Compositæ* American genera are represented in east tropical Africa, and Bentham is led on various grounds to regard this as the principal area of preservation of the most ancient tropical flora of the Old World.⁶ A well-marked eastern element in the African tropical flora is generally accepted. Madagascar, whose flora bears the marks of long isolation, contains Malayan and even Australian types, and it is a problem worth future inquiry whether the connection between the floras of tropical America and Africa may not have taken place south of the tropics, and by similar (though more northern) paths to those which once united the scattered members of the great Southern flora.

As might have been expected, during the Tertiary period the tropical flora extended much beyond its present limits. De Saporta, who has studied with great caution the fossil flora of the gypsaceous beds (Eocene) of Aix in Provence, arrives at the following conclusions:—"The principal families were such as characterize tropical vegetation, especially Indian—*Ebenaceæ*, *Anacardiaceæ*, *Sapindaceæ*, *Sterculiaceæ*, *Leguminosæ*. The affinities of the ancient vegetation of Aix in respect of generic types, general facies, and composition with that of India and the Indian archipelago, China, the Philippines, and Japan at the present day, are in perfect accordance with the theory that these regions formed the shores of our ancient nummulitic sea, extending from Morocco to Japan, and entirely comprised in the tropical zone of the Eocene world, which extended to the 55th parallel. Besides its relation to South-Eastern Asia, the Aix flora exhibits, according to De Saporta, a strong affinity with that of Africa, lying between Abyssinia and the Cape, of which, however, it must be confessed, but little is as yet known.

Here this outline of the present state of a most important and rapidly developing branch of biological science must be concluded. The writer has availed himself very freely of the kind permission of Mr Bentham—perhaps the greatest living master of the subject—to make use of his scattered but invaluable papers, not scrupling to borrow from them all that seemed most important and suggestive, but has generally thought it fairer both to the subject and to Mr Bentham to do so in his own words. For two heads of the subject it must suffice merely to give references. On the remarkable phenomena of insular floras, the reader should consult Sir Joseph Hooker's well-known lecture delivered before the British Association in 1866, and printed in the *Gardener's Chronicle* for January 1867, or, in default of this, the summary given in Lyell's *Principles of Geology*, 10th ed., vol. ii. pp. 417-421. On the means of dispersion of plants, reference may also be made to Lyell's work already quoted, vol. ii. pp. 386-400, Darwin's *Origin of Species*, 4th ed., pp. 425-442; Bentham, Presidential Address, 1869, pp. 7, 8. (W. T. T. D.)

the patient; 4th, the dose and mode of administration of the remedy. In illustration of each of these—1st, a dose of cantharides, which in a patient with the kidneys healthy would be diuretic, would in one with the kidneys acutely congested have the reverse effect; 2d, if there were much irritation of the gastro-intestinal tract, acid tartrate of potash, instead of producing diuresis, would probably cause diarrhœa, squills would induce vomiting, digitalis either diarrhœa or vomiting, 3d, Mindererus spirit, if taken by one exposed to an elevated temperature, would probably produce sweating, but if the temperature were low and the patient cool its action would be diuretic; 4th, many salines which in small doses are diuretic in larger doses are laxative; digitalis if too long continued diminishes the flow of urine, irritant diuretics in too large doses diminish or altogether arrest it. Diuretics are indicated when the quantity of urine is much diminished, or when, although the quantity may be normal, it is wished to relieve some other organ or set of organs of part of their ordinary work, or to aid in carrying off some morbid product circulating in the blood, or to hasten the removal of inflammatory serous exudations, or of dropsical collections of fluid.

DIVAN, or DIWÂN See MOHAMMEDANISM.

DIVER, a name that when applied to a bird is commonly used in a sense even more vague than that of LOON (*q.v.*), several of the Sea-Ducks or *Fuliginæ* (see DUCK) and MERGANSERS (*q.v.*) being frequently so called, to say nothing of certain of the Auks or *Alcidæ* and GREBS (*q.v.*); but in English ornithological works the term Diver is generally restricted to the Family known as *Colymbidæ*, a very well-marked group of aquatic birds, possessing great, though not exceptional, powers of submergence, and consisting of a single genus *Colymbus* (or *Eudyles* of some writers)¹ which is composed of three, or at most four, species, all confined to the northern hemisphere. This Family belongs to the *Cecomorpha* of Professor Huxley, and is usually supposed to occupy a place between the *Alcidæ* and *Podicipedidæ*; but to which of those groups it is most closely related is at present undecided. Professor Brandt in 1837 (*Beitr. Naturgesch. Vogel*, pp 124–132) pointed out the osteological differences of the Grebes and the Divers, urging the affinity of the latter to the Auks; while, thirty years later, Professor Alph. Milne-Edwards (*Os foss. France*, i pp 279–283) inclined to the opposite view, chiefly relying on the similarity of a peculiar formation of the *tibia* in the Grebes and Divers,² which indeed is very remarkable, and, in the latter group, attracted the attention of Willughby more than two hundred years since. On the other hand Professor Brandt, and Rudolph Wagner shortly after (Naumann's *Vogel Deutschlands*, ix p. 683, xii. p. 395), had already shewn that the structure of the knee-joint in the Grebes and Divers differs in that the former have a distinct and singularly-formed *patella* (which is undeveloped in the latter) in addition to the prolonged, pyramidally-formed, procnemial process—which last may, from its exaggeration, be regarded as a character almost peculiar to these two groups³. The evidence furnished by ecology and the newly-hatched young seems to favour Prof. Brandt's views, and, without according too much weight to such evidence, it certainly ought to be considered

before a decision is reached. The abortion of the *rectrices* in the Grebes, while these feathers are fairly developed in the Divers, is another point that helps to separate the two Families; but until their morphology has been worked out nothing can be safely averred on the subject.

The commonest species of *Colymbus* is *C. septentrionalis*, known as the Red-throated Diver from an elongated patch of dark bay which distinguishes the throat of the adult in summer-dress. Immature birds want the bay patch, and have the back so much more spotted that they are commonly known as "Speckled Divers." Next in size is the Black-throated Diver, *C. arcticus*, having a light grey head and a gular patch of purplish-black, above which is a semicollar of white striped vertically with black. Still bigger is the Great Northern Diver, *C. glaucalis* or *torquatus*, with a glossy black head and neck, two semicollars of white and black vertical stripes, and nearly the whole of the black back and upper surface of the wings beautifully marked with white spots, varying in size and arranged in belts.⁴ Closely resembling this bird, so as to be most easily distinguished from it by its yellow bill, is *C. adamsi*, the specific validity of which is not yet fully established. The Divers live chiefly on fish, and are of eminently marine habit, though invariably resorting for the purpose of breeding to freshwater lakes, where they lay two dark brown eggs on the very brink; but they are not unfrequently found far from the sea, being either driven inland by stress of weather, or exhausted in their migrations. Like most birds of their build, they chiefly trust to swimming, whether submerged or on the surface, as a means of progress, but once on the wing their flight is strong and they can mount to a great height. In winter their range is too extensive and varied to be here defined, though it is believed never to pass, and in few directions to approach, the northern tropic; but the geographical distribution of the several forms in summer requires mention. While *C. septentrionalis* inhabits the north temperate zone of both hemispheres, *C. arcticus* breeds in suitable places from the Hebrides to Scandinavia, and across the Russian empire, it would seem, to Japan, reappearing in the north-west of North America,⁵ though its eastern limit on that continent cannot yet be laid down; but it is not found in Greenland, Iceland, Shetland, or Orkney. *C. glaucalis*, on the contrary, breeds throughout the north-eastern part of Canada, in Greenland, and in Iceland. It has been said to do so in Scotland as well as in Norway, but the assertion seems to await positive proof, and it may be doubted whether, with the exception of Iceland, it is indigenous to the Old World,⁶ since the form observed in North eastern Asia is evidently that which has been called *C. adamsi*, and is also found in North-western America; but it may be remarked that one example of this form has been taken in England (*Proc. Zool. Society*, 1859, p. 206) and at least one in Norway (*Nyt Mag. for Naturevidenskaberne*, 1877, p. 134) (A. S.)

DIVIDIVI, the commercial name for the astringent pods of *Casalpinia coriaria*, a leguminous shrub of the sub-order *Casalpinieæ*, which grows in low marshy tracts

¹ By these writers the name *Colymbus* is generally used for what others term *Podiceps*.

² The remains of *Colymboides minutus*, from the Miocene of Langy, described by this naturalist in the work just cited, seem to show it to have been a generalized form. Unfortunately its *tibia* is unknown.

³ Garrod, in his tentative and chiefly myological arrangement of Birds (*Proc. Zool. Society*, 1874, p. 117), placed the *Colymbidæ* and *Podicipedidæ* in one Order (*Anseriformes*) and the *Alcidæ* in another (*Charadriiformes*), but the artificial nature of this assignment may be realized by the fact of his considering the other Families of the former Order to be *Anatidæ* and *Spheniscidæ*.

⁴ The osteology and myology of this species are described by Dr Coues (*Mem. Boston Soc. Nat. History*, i pp 131–172, pl. 5).

⁵ Mr Lawrence's *C. pacificus* seems hardly to deserve specific recognition.

⁶ In this connexion should be mentioned the remarkable occurrence in Europe of two birds of this species which had been previously wounded by a weapon presumably of transatlantic origin. One had "an arrow headed with copper sticking through its neck," and was shot on the Irish coast, as recorded by Thompson (*Nat. Hist. Ireland*, iii p. 201), the other, says Herr H. C. Müller (*Vid Medd. et Forening*, 1862, p. 35), was found dead in Kallbaksfjord in the Færoes with an iron-tipped bone dart fast under its wing.

in the West Indies and the north of South America. The plant is between 20 and 30 feet in height, and bears white flowers. The pods are flattened, and curl up in drying; they are about $\frac{3}{4}$ inch broad, from 2 to 3 inches long, and of a rich brown colour. Dividivi was first brought to Europe from Caracas in 1768. Its value in the manufacture of leather is due to the large amount of tannin contained in the yellow resinous matter exterior to the seed husks. It may be employed in dyeing as a substitute for galls or sumach. Maracaibo, Rio Hacha, and Sabanilla are the ports from which it is principally shipped.

DIVINATION. This term is used to mean the obtaining knowledge of secret or future things by revelation from oracles or omens. The derivation of the word points to *divine* influence communicated through the soothsayer, such as the equivalent Greek term *mantike* refers to the utterances of the spiritually inspired or possessed seer, *mantis*. It is well seen from Cicero's treatise *De Divinatione* that in classic times theology not only included in its system all revelation by oracles, which clearly belongs to it, but also claimed possession of a variety of diviner's arts, such as augury and astrology, on the ground that their signs were sent by the gods. On the side of the Stoics, it is there argued that if divination is a real art, then there must be gods who gave it to mankind, which proposition is met by the counter-suggestions that signs of future events may be given by nature without any god, or that there may be gods and yet they not have bestowed on man any such art as divination. The real point of the relation of divination to religion is touched in the division of it into two kinds, —*artificial divination*, by haruspication, prodigies, lightning, augury, astrology, and lots, as contrasted with *natural divination*, by dreams and prophetic oracles. On a general survey of such arts among mankind, it appears that oracles, &c., being taken as revelations made directly by spiritual beings, fall to be considered under headings treating of religion (see, e.g., **DEMONOLOGY**), but divining by such signs as the flight of birds or the falling of lots does not necessarily depend on the notion of intervening demons or deities. One part of its position is well stated in the argument by which Cicero makes his Stoic defend it:—If frogs by croaking, and oxen by snuffing the air, can give us signs to foretell the weather, why should there not be omens in the fibres of a victim's entrails, or in thunderstorms? But the religious view which regards omens as divine signs seems to have been from very early ages blended with the naturalistic view, so that in a great part of the cases it is impossible to disentangle them, or even to say which is the original one. This will appear in the following brief summary of the principal methods of divination. Now that the diviner's art has all but perished, we moderns are able to look back upon its history, to see how its futile proceedings were suggested by mistaken analogy, and how the experience of ages, which ratifies true inferences and destroys false fancies, is now reducing them to curious antiquarian relics.

The various "artificial" modes of divination for the most part rest evidently on the association of ideas in analogy and symbolism (see evidence in Tylor, *Early Hist. of Mankind*, p. 132; *Primitive Culture*, vol. i. p. 117, &c., 78.) A tree planted at a child's birth, or any other plant mentally associated with a person, gives a sign by its flourishing or withering as to that person's health or death (Ploss, *Das Kind*, vol. i. p. 71.) So with the sticks set up by Polynesians to see if the warriors they stand for will fall in battle, or with the cocoa-nut that is spun like a teetotum to point out a thief (Polack, *New Zealanders*, vol. i. p. 270; *Mariner's Tonga Islands*, ch. xx.) This kind of fanciful association appears in *sortilege*, or casting of lots, a proceeding remarkable not only for its antiquity but for the fre-

quency with which religions have adopted it as a means of obtaining divine guidance, from the ages when classic poets sang of Homeric heroes praying to the gods when they cast lots in Agamemnon's leather cap, or of Mopsus the soothsayer divining with sacred lots when the Argonants embarked on their voyage (Homer, *Il.*, vii. 175; Pindar, *Pyth.*, iv. 338), and on until modern times, when the Moravians still resorted to solemn religious lots to determine difficult questions, such as the choice of wives. Dice or astragali (hucklebones) have been used for the purposes of sortilege (see Suetonius, *Tiberius*), and *cartomancy*, or fortune-telling by means of playing-cards, is still common. In ancient times omens were drawn from poets' verses, fixed on by chance, a practice well known as *Sortes Virgilianæ*, from Virgil being often so consulted (see Smith's *Dic. Gr. and Rom. Antig.*, art. "Sortes"); and the Bible came to be afterwards so used for drawing texts, or "pricking for texts," this practice is still very usual in Germany (see Wuttke, *Deutsche Volksaberglaube*, 2 ed., p. 227.) The *haruspication*, or examination of entrails, by which Roman statesmen were (or pretended to be) guided in public affairs (see Cicero, *De Div.*, ii. 12; Plin. *H. N.*, xi. 73); and *scapulimancy*, or the Tatar mode of divining by the cracks and lines in a shoulder blade (Lubbock, *Origin of Civilization*, p. 230), formerly known in England as "reading the speal-bone" (Brand, *Popular Antiquities*, vol. iii. p. 339), depended on imaginary symbolic associations, such as that cracks in opposite directions meant good and ill fortune, that the course of particular lines indicated the course of the consulter's life, &c. This sort of false analogy may be well understood by any one who will have the similar art of *palmistry*, or divining by the lines of the hand, applied to his own future by a fortune-teller at a fair. Omens obtained by *augury*, or divining by the sight and cries of animals, especially birds (as the name indicates), are as familiar among uncivilized races as they were in ancient Rome; their symbolism is apparent in such rules as that a hawk means victory, an owl's hoot is unlucky, and that a beast or bird on the right hand portends good, but on the left hand evil (Tylor, *P. C.*, vol. i. p. 119). Another class of arts depend on the unconscious or half-conscious action of some person, often the diviner himself. Among these is the use of the well-known divining rod, which when held in the hands, dips to indicate a hidden spring of water, a vein of ore, or a buried treasure (Brand, vol. iii. p. 332; see Chevreul, *De la Baguette Divinatoire*, &c.) The use of this instrument remains in some districts of England; it is locally known as "dowsing," whence no doubt the name of Doussterswivel in *The Antiquary*. Similar in principle is the ancient *coscinomancy*, or divining by a sieve held suspended, and giving its indications by turning. In later times this gave place to the ordeal by the Bible and key, where the book is suspended by a key tied in with its wards between the leaves and the key supported on two persons' forefingers, and the whole turns round to prove guilty some servant maid accused of theft (Brand, vol. iii. p. 351). In such cases, where the culprits' fears are apt to betray them, the process of divination really serves as a practical test. Dreams are not only considered visits from ghosts, but often also as supernatural signs to be interpreted symbolically, as when a Kamtschatkan dreaming of dogs or lico would take it as foretelling a visit from Russians (Steller, *Kamtschatka*, p. 279). Of such interpretations the ancient art of *oneiromancy* consists, as may be seen in such rules as that if a woman dreams of kindling a fire, she will bear a male child; if one dreams of white clouds it means joy, but if black clouds trouble (Brand, vol. iii. p. 132; Tylor, *l.c.*). It remains to mention in few words *astrology*, the branch of divination whose importance

in the world has exceeded that of all the rest together. Researches into the ancient writings of Chaldaea have now shown how fully historians were justified in treating that country as the principal among the sources whence the star-gazers received their precepts (see Sayce, "Astronomy and Astrology of the Babylonians," in *Trans. Soc. Bibl. Arch.*, vol. iii; Maury, *La Magic et l'Astrologie*.) The rules in such comparatively modern works as Sibly's *Occult Sciences* and Lilly's *Astrology* fairly enough represent the ancient traditions, and show their still intelligible symbolism,—how the stars rising at a child's birth are made in the horoscope to typify its destiny, and the planets and signs of the zodiac exercise "influences" often plainly drawn from their natures or names. Thus Mars has to do with soldiers, Venus with lovers, and Mercury with prattlers; the solar man is grand and generous, the lunar man unsteadfast and inclined to change his dwelling, the sign Leo presides over places where wild beasts abound, but Aries over pastures. At the courts of Asiatic rulers, the state astrologer still nominally holds a position like that of his predecessor in the ancient empires of the world, but it is evident that the last twenty years have shaken, even in the barbaric East, the power of the occult sciences over the human mind. (R. B. T.)

DIVING. The art of diving to considerable depths under water to bring up pearls, corals, and sponges has been practised in the Indian seas from very early times, and if we may believe the accounts that have come down to us, the feats of early divers are truly remarkable—some of them, it is said, having been able to prolong their submarine descents for periods varying from two to three minutes. It is obvious, however, that not having the aid of any artificial appliances for supplying air, the powers of these bold adventurers, both as regards the depth to which they could descend and the length of time they could remain submerged, were comparatively limited.

At an early period, therefore, the attention of philosophers and mechanics was turned to the discovery of a contrivance for aiding the diver in prosecuting his daring but useful calling, which was rendered all the more important from its being no longer confined to the acquisition of Eastern luxuries, but to the raising of treasure from sunken vessels. It is not considered expedient to occupy space by further reference to the feats of the early divers, out rather to pass at once to the history and construction of the diving apparatus of modern times, as illustrated by the Diving Bell and the Diving Dress at present in use. And here it may be stated that in addition to the sponge and coral trade of foreign lands, which has been greatly advanced by the use of modern appliances, there are the works of the naval engineer, and more particularly of the civil engineer, in which diving apparatus is so extensively employed and so essentially necessary as to place the art of diving on a wider basis, and to give it an importance only fully developed within the present century.

Diving Bell.—The most useful of ancient contrivances is the diving bell, which, introduced at an early period and gradually improved, is now the well-known apparatus used by engineers in the present day; and it may be interesting to trace the successive improvements that have brought it to its present state of perfection and usefulness in conducting submarine works.

The conception of the diving bell is very simple. The air contained in an inverted jar sunk in a vessel of water excludes the water from the interior, and if the vessel be made of sufficient size to contain persons within it, it may be sunk without their being wetted, and they may continue to be submerged so long as the air within the bell continues pure enough to support animation. Such were the "diving-chests" of the first makers, which, though they differed in

form and details, were constructed on the same principle as the modern bell, and were generally formed of wood, girded with iron hoops, like a barrel.

It will be obvious that if such a vessel were submerged in shallow water, having a depth of say one foot of water, a large supply of air would be inclosed in the bell, and the bottom on which it rested would, from the small depth of water upon it, be easily reached for any operation to be performed on it. But if we conceive the same bell to be lowered further below the surface, the air being compressible will be reduced in volume, and the water will rise in the bell to fill its place. The result would be that at the depth of about 33 feet the air would be compressed into about one-half its original bulk, and the bell itself would be half filled with water; and the bottom of the sea on which it rested would no longer be so conveniently reached as when the water was only a few inches above the lips of the bell. Moreover, the air by repeated inspiration becomes unfit to support life, and the ancient bells had to be raised to the surface at very short intervals of time that fresh air might be supplied to the men employed. Although, therefore, the original diving bell was a step towards the perfect appliances afterwards introduced, it will readily be seen that its use in diving operations was very limited indeed.

Dr Halley, the secretary of the Royal Society, who seems to have taken an interest in diving and divers, and compassionate their want of fresh air, communicated a paper to the Royal Society in which, to use his own words, he proposes a plan "for carrying the *phlogiston* down to the diver, who must without being supplied therewith return very soon to the surface or perish." The following is the description of his arrangements for this purpose. After describing the bell itself, which was of wood of the form of a truncated cone, with a capacity of 60 cubic feet, and was suspended by a spout from the mast of a ship, he says—

"To supply air to this bell when under water, I used a supply of barrels, of about 50 gallons each, to be sent down with the bell, each of them having a bung-hole in its lower part to let in the water, as the air in them condensed on the descent, and to let it out again when they were drawn up full from below. As I made a hole in the upper part of the barrels I fixed a small iron hose, long enough to fall below the bung-hole, being fastened by a weight appended, so that the air in the upper part of the barrel could not escape, unless the lower ends of these hoses were first lifted up.

"The air-barrels being thus prepared, I fastened them with the proper toads to the bell, and I filled it with water, and sent down two buckets in a well, and in their descent they were directed by lines fastened to the under edge of the bell, which passed through rings on both sides of the bottom hole in each barrel, so that, sliding down by these lines, they came readily to the feet of a man, who stood on purpose to receive them, and to take up the ends of the hose into the bell. Through the hoses, as soon as the ends came above the surface of the water in the barrels, all the air that was included in the upper parts of them was blown with great force into the bell, whilst the water entered at the bung-holes below and filled them, and as soon as the air of one barrel had been thus received, upon a signal given that it was drawn up, and at the same time the other descended, and, by an alternate success, furnished air so quick, and in so great plenty, that I say of I was for one of five who have been together at the bottom, in more than ten fathoms water, for above an hour and a half at a time, without any sort of ill consequence, and I might have continued there so long as I pleased, for anything that appeared to the contrary. I only observed that it was necessary to be let down gradually at first, at about 12 feet at a time, and then to stop and drive out the air that entered, by receiving 3 or 4 barrels of fresh air before I descended further. But being arrived at the depth designed, I then let out as much of the hot air that had been breathed as each barrel would replenish with cool, by means of the cock at the top of the bell, through whose aperture, though very small, the air would rush with so much violence as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water over it.

"Thus I found that I could do anything that required to be done just under us, and that I could, for a space as wide as the circumference of the bell, lay the bottom of the sea so far dry, as not to be over

shoes thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, I could see perfectly well to write or read, much more to fasten or lay hold on anything under us that was to be taken up, and, by the return of the air barrels, I often sent up orders, written with an iron pen on small plates of lead, directing how to move up from place to place as occasion required. At other times when the air was troubled and thick, it would be as dark as night below; but in such cases I have been able to keep a candle burning in the bell as long as I pleased, notwithstanding the great expense of air necessary to maintain flame. This I take to be an invention applicable to various uses, such as fishing for pearls, diving for coral or sponges and the like, in far greater depths than has hitherto been thought possible; also for the fitting and placing of the foundations of moles, bridges, &c., in rocky bottoms, and for cleaning and scrubbing of ships' bottoms when foul, in calm weather at sea. I shall only intimate that, by an additional contrivance, I have found it not impracticable for a diver to go out of an engine, to a good distance from it, the air being conveyed to him with a continued stream by small flexible pipes; which pipes may serve as a clue to direct him back again when he would return to the bell."

Such is an account of Dr Halley's apparatus, which undoubtedly effected an important improvement; but it involved the sending down of constant relays of air vessels, and the great loss of time and interruption which attended such a means of supply. It remained for Smeaton to overcome these objections. In repairing the shoeing of the foundations of Hexham Bridge, in 1778, there being but a small depth of water, to work in, he contrived a bell to the top of which he attached a force pump in lieu of Dr Halley's air-barrels, and as the bell, in consequence of the small depth of water, did not require to be wholly submerged, the supply of air for the divers was forced directly into the bell, being the first application of the force pump for that purpose.¹ Subsequently to this, in 1748, having occasion to remove stones in clearing the foundations for a pier at Ramsgate, he applied an air-pump placed in a ship or barge, and pumped air into the bell at any depth under water by means of a hose screwed into an air-hole in the top of the bell. The following is Smeaton's description of his last improvement:—

"Instead of the usual form of a bell, or of a conical tub of wood sunk by weights (externally applied), this for convenience was a square chest of cast iron, which being 50 cwt. was heavy enough to sink itself, and being 4½ feet in height, 4½ feet in length, and 3 feet wide, afforded room sufficient for two men at a time to work under it. But it was peculiar to this machine that the men therein were supplied with a constant influx of fresh air without any attention of theirs, that necessary article being amply supplied by a forcing air-pump in a boat upon the water's surface."

It will thus be seen that Smeaton's Ramsgate bell contained all the elements of the present appliances, which, as improved in details, and constructed by Messrs Rennie, has been so extensively employed in harbour works.

The bell as now used is shown in plan and section in figs. 1 and 2. It is a cast-iron chest weighing about 5 tons, and is suspended by block and tackle.

On the top of the bell there are 8 apertures *a*, fitted with very thick glass for admitting light; and in the centre is the passage *b*, into which the hose is screwed for admitting the air supply. The interior is fitted with two seats *e*, which can be removed to make room when the men are at work, and in the centre is a lifting chain *c*, to which stones are attached to facilitate their being lifted and properly adjusted to the beds on which they are to be laid. The bell is used according to two different systems, depending on the

FIG. 1.—Plan of Diving Bell.

nature of the work to be performed. In building masonry under water it is suspended from a staging of timber, but in excavating rock or removing boulders, scattered over

FIG. 2.—Section of Diving Bell.

a considerable area, where a staging would be inapplicable, it is suspended from a barge or lighter.

Fig. 3 shows the arrangement as employed in laying stones or blocks of concrete. It represents a cross section of the staging, bell framing, and bell carriage, in which a

FIG. 3.—Block-laying by Diving Bell.

is the staging, *b* longitudinal beams on which the bell-framing *cc* traverses on the wheels and toothed racks *d*. The diving bell *e* is suspended from the bell carriage *f*, which traverses on the bell framing by the wheels and toothed rack *g* across the whole breadth of the pier. The stones *h* are brought along the surface of the finished part of the pier, and lowered down by the travelling crab-winch *l*. The force-pumps by which the bell is supplied with air are shown at *m*, and the air-hose at *n*. It will be understood from this description that the bell framing *c*, moves freely along the staging, while the bell carriage has a

¹ Smeaton's Reports, vol. iii p 279.

² Historical Report on Ramsgate Harbour, by John Smeaton, London 1791, p 70.

motion at right angles across the work, so that the position of the bell can be altered with the greatest ease so as to bring it over any spot within the area of the staging.

In proceeding to work, the men take their seats in the bell from a boat, and the bell is then lowered to the required depth. If the work be that of building a wall a stone is lowered at the same time. The changes in the position of the bell are all made according to signs given by the divers by strokes of a hammer on the bell, which experience has shown can be heard at any depth at which the diving bell has been employed. The signals are—one stroke, more air; two, hold on; three, raise; four, lower; five, north; six, south; seven, east; eight, west. These signals are narrowly observed by a watchman stationed in a boat, and reported to the men working the bell carriage. The rule for the supply of air both to the bell and diving dress is to give it so freely that there shall be a constant escape of air rising to the surface in air-bubbles all the time the men are under water. After being lowered, the bell is first moved over the stone to be laid, the divers then unhook the lowering chain from the lewis in the stone, and at the same time make fast the stone to the tackle within the bell, which is at once signalled to be raised, and carries the

stone with it. The bell is then moved over the site on which it is to be placed; it is then lowered until it has nearly reached its bed, on which it is finally deposited. The lewis is then removed and the bell raised for another stone; and with trained workmen it is surprising how expeditiously the bell is moved from place to place, and stone after stone is built in the walls. The staff of men required to work the bell is two divers, one watchman, four men working the air-pump, and four working the bell carriage, besides the men required to bring forward and send down the stones. The men engaged generally work in shifts of from 3 to 6 hours according to the depth, and the diving work may be continued as long as in ordinary day-work, as in clear water the light is good to the greatest depth at which the bell is used in harbour building.

When engaged in blasting, the bore is made in the ordinary way, and charged with a shot inclosed in a water-tight canvas case, to which is attached a length of 6 or 8 feet of patent fuse. The bell is then moved from above the bore, and the fuse ignited, and when the shot is fired the smoke rises to the surface clear of the bell.

When employed for removing rock or boulder stones—for

FIG. 4.—Longitudinal Section of Diving Bell Lighter (56 feet long and 24 feet beam)

example, in a river navigation,—it is of advantage that the bell be capable of being easily transported, and in that case it is swung from a barge or lighter, which contains the machinery for working the bell, and air-pumps, and a crane

for raising the boulders as the divers sling them. It is of course attended with greater trouble and risk to the divers to work the bell from a lighter than from a stage; but, on the other hand, the convenience in being enabled to trans-

FIG. 5 —Plan of Bell Lighter (56 feet long and 24 feet beam).

port it from place to place, in a river navigation, is a great advantage.

Figs. 4 and 5 show the disposition of the various appliances in the most recent bell-lighter built by Messrs

Simons of Renfrew for the River Clyde, which was communicated by Mr Deas, the engineer, to the Clyde Trustees. Fig. 4 is a longitudinal section, and fig 5 a plan in which *a* is the bell, *b* the bell crab, *c* the air-pumps, and *d* the crane for lifting stones, &c., slung by the divers

The large cost of a diving bell limits its use to works of magnitude, especially as many submarine works can be done better by the diving dress, which is much less expensive; but there are certain operations, such as the clearing and levelling of foundations, for which the bell is peculiarly well adapted, that still enable it to take its place as one of the most useful appliances of the marine engineer. Mr B. B. Stoney has, in an interesting paper in the *Minutes of Proceedings of the Institution of Civil Engineers*,¹ described a diving bell, or chamber, 20 feet square, with which he successfully built the foundation of the quays of Dublin. Mr Stoney's apparatus does not come under the article diving, but belongs more properly to the subject of the compressed air cylinders used in bridge building, which are described under the article BRIDGE.

Diving Dress.—The diving dress is peculiarly well fitted for such works as the repair or overhaul of rollers and sluices of lock-gates, cleaning or repairing ships' bottoms, descending into the hatches of wrecks to recover property, and, in short, everything that cannot be done from the interior of a bell. The inexpensiveness also of the diving dress, dispensing with all costly staging, and its ease of transport and appliance, are much in favour of its use. It is, indeed, so convenient in the repair of propellers, examining ships' bottoms, recovering anchors, &c., that all ships in Her Majesty's navy of sufficient size to be commanded by captains are now supplied with a diving dress or apparatus, and bear a certain number of divers in their complements; and all sea-going flagships and iron-clads on foreign stations carry two sets of diving apparatus, and are allowed a suitable number of trained divers

The invention of the diving dress, like that of most useful appliances, was gradual, and the work of many minds. Some early proposals, such as that already referred to in the quotation from Dr Halley's paper in 1721, and others of more modern date, were made for providing the diver with a dress to enable him with safety to carry on his work, for an account of which the reader is referred to a paper by Mr J. W. Heinke in the *Minutes of Proceedings of the Institution of Civil Engineers*.² But to Mr A. Siebe is due the credit of being the first to introduce a dress which was supplied with a constant stream of fresh air, and may be said to have been the precursor of the dress now in use. We allude to what was called the "open dress" invented in 1829, which consisted of a helmet and water-proof jacket, under which, and fitting more closely to the body, were worn trousers reaching to the arm-pits, and between the jacket and trousers the air pumped in at the helmet was allowed to force its way and escape to the surface as in the diving bell, and hence it was called "open." Although some divers of the old school are said still to give a preference to the open dress, its danger became manifest; for if a diver stumbled and fell on his face or side, the water entered his dress, and unless quickly brought to the surface he was in danger of being drowned—a necessary requirement of the open dress being that he should remain in an upright or gently stooping position. To meet this defect, Mr Siebe, in 1837, introduced the "close" dress, which is now almost universally used. Various minor improvements were introduced between 1839 and 1843 connected with the removal of the wreck of the "Royal George" ship of war, conducted by the

late Sir Charles Pasley, which will be found fully described in the *Minutes of Proceedings of the Institution of Civil Engineers*.³ The long continued experience gained in diving while these operations were in progress suggested improvements and alterations which had a great effect in bringing the diving dress to its present perfection as now manufactured by Siebe, Heinke, Barnett, and other makers

The diving dress, as will be understood from fig. 6, envelops the whole body of the diver, the upper portion *a* being the "helmet," the intermediate portion *b* the "breast-plate," and the lower portion *c* the "dress." The hose by which the air is supplied is shown at *d*, and *e* is the "life" or "signal" line, which is attached to the diver's waist, and by which he makes signals and is hauled to the surface. The water-proof material of which the dress is made is very generally sheet india-rubber covered on both sides with tanned twill to protect the india-rubber from injury. The cuffs fit tightly round the wrists, leaving the hands free, and india-rubber bands slipped over them render the joint water-tight. The breast-plate *b* is made of tinned copper with an outer edge of brass, which has screws fitted to it projecting upwards and passing through corresponding holes in the collar of the dress. On the top of this, and with holes in it corresponding to the screws, four pieces of a metal band are firmly screwed down by wing nuts, nipping the soft material of the collar between the metal of the breast-plate and band, and thus ensuring a water-tight joint. On the front of the breast-plate two studs are fastened for securing the back and front weights *g*. Some makers put a valve *h* on the front of the breast-plate, by means of which the diver can regulate the pressure inside his dress at will, and in this way has the power, by simply inflating his dress more or less, of making himself of any specific gravity, so as to float at any desired depth or rise to the surface without the assistance of the attendant. This arrangement in the hands of a skilled diver is undoubtedly a great convenience. But it is still a matter of difference of opinion whether it is not safer to trust to being hauled up by the watchman on the surface, whose duty it is to hold the *life* or *signal* line in one hand, and the air hose in the other, while the diver is at work, and to attend to whatever signal he may give by pulling the *life* line. The inconvenience of the air bubbling up in front of the diver's eyes, and the danger of inexperienced divers becoming giddy and turning the valve the wrong way, have induced some makers to do away with this useful valve, and to substitute at the back of the helmet a valve which the diver can regulate by the pressure of his hand, but which rights itself the moment his hand is removed. The neck of the breast-plate is fitted with a "segmental screw bayonet joint" (introduced by Messrs Siebe), and to this the helmet, the neck of which is fitted

FIG 6—Diving Dress.

¹ Vol. xxxvii. p. 339.

² Vol. xv. p. 309.

³ Vol. xv. p. 323.

with a corresponding screw, can be attached or removed by one eighth of a turn. The helmet, a side view of which is given in fig 7, is made of tinned copper, and fitted in front with three strong plate-glass windows, or bulls' eyes, in brass frames protected with guards. Messrs Heinke introduced sliding covers to draw over these windows in case of their getting broken. The front eye piece is made so that it can be unscrewed, and in this way the diver on ascending can rest himself for a short time or give orders

FIG 7.—Diver's Helmet.

without removing the rest of his dress. Messrs Barnett have introduced instead of this a hinged glazed frame, which fits tightly into a conical vulcanized india-rubber seat like the ordinary port hole of a ship, so that it can be opened by the diver himself the moment his head is above water, and being attached to the helmet it cannot be dropped accidentally into the sea or otherwise mislaid. An outlet valve *a* is fixed at the back of the helmet, which, opening outwards, permits the escape of the foul air but prevents the entrance of water. The inlet valve *b* to which the hose is attached is also fixed at the back of the helmet, and is so constructed as freely to admit the air from the force pump; but should anything occur to the hose or pumps the valve at once shuts, inclosing a sufficient supply of air in the dress to support the diver till he can be hauled to the surface. The air after entering by the inlet valve is conducted in tubes *c* to the front of the helmet, so that the diver has the advantage of inhaling fresh air, and the front glasses are kept free from the condensation of his breath which would otherwise take place. On each side of the helmet is a hook over which the cords pass which carry the front and back weights, and a brass stud to one of which the life line, and to the other the air tube, are attached; *d d* is the joint by which the helmet is screwed upon the breast-plate. The back and front weights weigh about 40 lb each, and are held close to the diver's body by means of a lashing passing under his arm-pits. The boots are made of stout leather, with leaden soles, secured by two buckles and straps, each boot weighing about 20 lb.

The cost of a diving dress, with all its appliances, is about £140

The sponge, pearl, and coral fisheries, originally carried on only by naked divers, as already noticed, are now conducted to a great extent by the help of artificial aids; and, according to Mr Siebe, upwards of 300 sets of diving dresses are employed in the Mediterranean sponge fisheries alone, and they are being introduced in the Bahamas, Bermudas, Ceylon, the West Indian Islands, and on the coast of Australia.

As already stated, at moderate depths not exceeding 30 to 40 feet, and with clear water, sufficient light is transmitted to enable the diver to perform any ordinary work, and in working in turbid water with the diving bell candles are employed. Mr Siebe has also constructed an electric lamp and an oil lamp which can be employed where light requires to be used by divers at great depths.

Captain Eads¹ states that at the Mississippi bridge candles were at first employed, which, under a pressure of 100 feet, were found to be burnt down in about three-fifths of the time required in the open air; under a pressure of 80 feet it was found that a candle if blown out by the breath would immediately reignite; and at the depth of 108¹ feet a candle was blown out thirteen consecutive times in the course of half a minute, and each time excepting the last was reignited.

The depth at which diving can be safely conducted is a question of importance. The ordinary depth at which the diving bell has been employed in harbour works is from 30 to 35 feet, and it has been used in 60 feet at Dover.

With the diving dress much greater depths have been attained. Mr Siebe relates that in removing the cargo of the ship "Cape Horn," wrecked off the coast of South America, a diver named Hooper made 7 descents to a depth of 201 feet, and at one time remained 42 minutes, supposed to be the greatest diving feat ever achieved. Mr. Frendenberg states that in the repair of a pump in the Scharley zinc mines in Silesia two divers went down the pump well to a depth of 85 feet, remaining from periods varying from 15 minutes to two hours.² In the knowledge of the author the greatest depth at which the diving dress was used in the open sea was in the Firth of Forth. A Royal Commission "on the Operation of the Acts relating to the Trawling for Herring on the Coast of Scotland" resolved to obtain the herring spawn from various portions of the exposed parts of the firth, and this duty was successfully accomplished in depths of from 14 to 16 fathoms, from the deck of the "Princess Royal" cutter, under the command of Mr Macdonald.

The writer is indebted to Mr P. J. Muesent, the engineer of the Tyne piers, for the following notes of his experience at that work. "On the Tyne Pier works helmet and bell divers are employed simultaneously—the former for excavating for and fixing the feet of the piles of which the staging is formed, the bell divers for leveling the foundations and fixing the blocks of which the pier is composed. The helmet diver has greatest power in lifting. He can exert but a few pounds of force in pulling downwards (unless he can fasten himself down) on account of his buoyancy, and for the same reason he cannot pull or push horizontally with much force unless he has a fulcrum or stop for his feet or body. Thus, in boring an augur hole in a pile he would have to lash himself to it, unless there was a projecting rock or stone that he could get his feet against. In the use of a hammer and other tools for striking he is restricted by the water," but Mr Muesent has known good men do fair work with a hammer and chisel. It is difficult for them to walk against even a moderate tide, and men who by accident get on the (lee) tide side of their work, generally have to be hauled up to their boat and lowered down again in order to get on the (windward) tideward side of it; again experience enables many of these difficulties to be met or modified, but it is advantageous to bear them in mind in arranging work for divers. Most of the divers at the Tyne have been made or instructed on the works, and of the men who have tried helmet diving not more than one out of three or four succeed or become divers, the failure being sometimes from physical causes, but more often from want of head. There is less difficulty in making bell-divers, probably on account of their working in company, there being always two men in a bell, and the same amount of self-reliance is not needed.

¹ Reports by Captain James B. Eads to the President and Directors of the Illinois and St. Louis Bridge Company.

² Minutes of Proceedings of Inst. of Civil Engineers, vol. xlv. p. 313.

The practice of diving obliges the diver to conduct his work under a pressure greater than that of the atmosphere at the surface of the earth. All diving work is done under an abnormal atmospheric pressure, which increases with the depth at which the diver is submerged in water. This pressure, when he is submerged to the depth of 33 feet, is twice that of the normal superficial atmospheric pressure. At greater depths the pressure is proportionately increased, and ultimately becomes so great that life could not be maintained. To descend even to the moderate depth of 30 or 40 feet, which is about the maximum required for ordinary engineering sea works, demands some practice and nerve on the part of the diver, but when greater depths have to be explored, in raising sunk vessels, for example, the energy and power of endurance of the diver are much more severely taxed, and it seems not uninteresting, before concluding this article, to refer to the effect which the work has on the health of the diver, as well as on some physiological facts of interest in general science.

The sensations experienced in a diving bell are common, it is believed, to all divers. According to the writer's experience, very soon after the lips of the bell have touched the surface of the water pain is felt in the ears and above the eyes, which continues with greater or less intensity according to the rate of descent until the bell has attained the bottom. So long as the bell continues there no pain is felt, the only feeling being that of depression due to the depth to which the diver is submerged. As soon as the upward movement commences the pain in the ears and above the eyes returns, and continues till the surface is reached. The motion of the bell is very gradual, sometimes not exceeding 3 feet per minute, but even at that slow rate the head does not accommodate itself to the increase of pressure so as to avoid inconvenience. Aeronauts do not suffer to the same extent in their ascents in balloons, because the alteration of pressure is much more gradual in passing through the atmosphere than through a medium having the density of water.

Several suggestions have been offered as accounting for the sensations which are experienced in diving, and the following explanation, which the author has submitted to Professor Turner of Edinburgh, is believed to afford the true solution.

Under the ordinary atmospheric conditions, the air presses not only on the surface of the body, but into every cavity within the body which communicates with the surface, so that the pressure, both externally and internally, is exactly balanced. In passing into a denser atmosphere the increased pressure operates externally more rapidly than it does internally, more especially if the communication of the internal cavities with the surface is by tortuous passages; and so long as this inequality in the pressure exists the disagreeable sensations in the ears and above the eyes will continue. The pain in the ears arises from the effect of the condensed air acting externally on the tympanic membrane of the ear, before the air within the tympanic cavity has acquired the same density to counterbalance it. The tympanic membrane stretches across the bottom of the passage or meatus, which leads from the outer ear into the side of the head (see ANATOMY, fig 80). This passage is in direct communication with the atmosphere, the pressure of which, therefore, acts instantaneously on the tympanic membrane. But on its inside the tympanic membrane bounds the tympanic cavity, which has no communication with the external air, excepting by the Eustachian tube, which leads from the cavity into the pharynx immediately behind the nose. Through this tube, therefore, the condensed air must pass from the pharynx to supply what is necessary within the cavity for restoring the same equilibrium within and without. But the

Eustachian tube is a long and narrow passage; at its commencement in the ear it has a bony structure, but towards its termination in the pharynx behind the nostrils, it becomes soft, so that its walls can be forced together. It admits an easy passage from the ear to the pharynx; but when any pressure arises in the opposite direction, it acts in some degree like a valve, shutting the passage, until the increasing pressure again forces it open. Some time then elapses before all this can be accomplished; and during this time the external air, pressing with full force on the tympanic membrane, produces the pain which is felt. When the Eustachian tube opens, it is generally all of a sudden, and with a slight explosion or pop, which is followed by instant relief from the pain. This relief may often be produced by filling the mouth, or gulping the air and passing it into the tube.

That the above is what really takes place may be shown experimentally by shutting the mouth and nostrils, and exhausting the air from them by the action of the lungs. The air in the tympanic cavity immediately rushing through the Eustachian tube into the mouth, the external air acts on the tympanic membrane and produces a slight sensation of deafness, such as is felt in the bell. But if, instead of exhausting the air, we attempt to compress it, and force it through the tube into the tympanic cavity, at first no effect is produced; but after exerting a considerable pressure a slight pop is felt, and a little pain in the ear, which is just the sudden opening of the tube.

The pain above the eyes is doubtless due to the inequality between the pressure of the air on the surface of the forehead and that of the air in the frontal sinuses, or air spaces in the frontal and other bones which form the boundaries of the orbits. The return of the disagreeable sensations during the upward ascent of the bell is due to the pressure on the outer surface of the tympanic membrane and of the forehead being diminished, before the air within the tympanic cavity and the air spaces in the bones of the orbits has accommodated itself to the diminished external pressure.

It may further be interesting to notice that any upward motion is accompanied by a thick mist within the bell, which disappears when it is stationary or moving downwards. The explanation is that the air inside the bell, when it is ascending, being relieved of pressure, expands, and its temperature is lowered, and as the air inside is about the point of saturation, the fall of temperature produces condensation, which becomes visible in the form of vapour or mist. An analogous phenomenon takes place in commencing to exhaust the receiver of an air-pump.

The question of the effect produced on the health of the men employed in diving is of interest and importance. So far as the author's experience goes, he is not aware that divers suffer from prosecuting their submarine work under the pressure of one or two atmospheres to which they are subjected in ordinary harbour works, the men selected for such duty being generally healthy young men of athletic make. Indeed, it is well known that to some constitutions, and in some forms of disease, *subjection to moderate increase of atmospheric pressure proves beneficial*. But when greater depths and high pressures have to be sustained the case may be very different.

Mr Siebe, who states the greatest depth to which a diver has descended to be 201 feet, with a pressure of 87 lb on the square inch (but who states 150 feet as the limit for safe work), has given various directions, the result of his experience, as to the selection of men for deep diving, and advises that men should not be employed who are of full habit of body, who suffer from headache or deafness, who have at any time had spitting of blood or palpitation of the heart, who are pale and whose circulation is languid,

Effect of diving : the effect of the divers.

with a corresponding screw, can be attached or removed by one eighth of a turn. The helmet, a side view of which is given in fig 7, is made of tinned copper, and fitted in front

with three strong plate-glass windows, or bulls' eyes, in brass frames protected with guards. Messrs Hemke introduced sliding covers to draw over these windows in case of their getting broken. The front eye piece is made so that it can be unscrewed, and in this way the diver on ascending can rest himself for a short time or give orders

FIG 7.—Diver's Helmet.

without removing the rest of his dress. Messrs Barnett have introduced instead of this a hinged glazed frame, which fits tightly into a conical vulcanized india-rubber seat like the ordinary port hole of a ship, so that it can be opened by the diver himself the moment his head is above water, and being attached to the helmet it cannot be dropped accidentally into the sea or otherwise mislaid. An outlet valve *a* is fixed at the back of the helmet, which, opening outwards, permits the escape of the foul air but prevents the entrance of water. The inlet valve *b* to which the hose is attached is also fixed at the back of the helmet, and is so constructed as freely to admit the air from the force pump, but should anything occur to the hose or pumps the valve at once shuts, inclosing a sufficient supply of air in the dress to support the diver till he can be hauled to the surface. The air after entering by the inlet valve is conducted in tubes *c* to the front of the helmet, so that the diver has the advantage of inhaling fresh air, and the front glasses are kept free from the condensation of his breath which would otherwise take place. On each side of the helmet is a hook over which the cords pass which carry the front and back weights, and a brass stud to one of which the life line, and to the other the air tube, are attached; *dd* is the joint by which the helmet is screwed upon the breast-plate. The back and front weights weigh about 40 lb each, and are held close to the diver's body by means of a lashing passing under his arm-pits. The boots are made of stout leather, with leaden soles, secured by two buckles and straps, each boot weighing about 20 lb.

The cost of a diving dress, with all its appliances, is about £140.

The sponge, pearl, and coral fisheries, originally carried on only by naked divers, as already noticed, are now conducted to a great extent by the help of artificial aids; and, according to Mr Siebe, upwards of 300 sets of diving dresses are employed in the Mediterranean sponge fisheries alone, and they are being introduced in the Bahamas, Bermudas, Ceylon, the West Indian Islands, and on the coast of Australia.

As already stated, at moderate depths not exceeding 30 to 40 feet, and with clear water, sufficient light is transmitted to enable the diver to perform any ordinary work, and in working in turbid water with the diving bell candles are employed. Mr Siebe has also constructed an electric lamp and an oil lamp which can be employed where light requires to be used by divers at great depths.

Captain Eads states that at the Mississippi bridge candles were at first employed, which, under a pressure of 100 feet, were found to be burnt down in about three-fifths of the time required in the open air, under a pressure of 80 feet it was found that a candle if blown out by the breath would immediately reignite; and at the depth of 108½ feet a candle was blown out thirteen consecutive times in the course of half a minute, and each time excepting the last was reignited.

The depth at which diving can be safely conducted is a question of importance. The ordinary depth at which the diving bell has been employed in harbour works is from 30 to 35 feet, and it has been used in 60 feet at Dover.

With the diving dress much greater depths have been attained. Mr Siebe relates that in removing the cargo of the ship "Cape Horn," wrecked off the coast of South America, a diver named Hooper made 7 descents to a depth of 201 feet, and at one time remained 42 minutes, supposed to be the greatest diving feat ever achieved. M. Frandenbergh states that in the repair of a pump in the Scharley zinc mines in Silesia two divers went down the pump well to a depth of 85 feet, remaining from periods varying from 15 minutes to two hours.³ In the knowledge of the author the greatest depth at which the diving dress was used in the open sea was in the Firth of Forth. A Royal Commission "on the Operation of the Acts relating to the Trawling for Herring on the Coast of Scotland" resolved to obtain the herring spawn from various portions of the exposed parts of the firth, and this duty was successfully accomplished in depths of from 14 to 16 fathoms, from the deck of the "Princess Royal" cutter, under the command of Mr Macdonald.

The writer is indebted to Mr P. J. Messent, the engineer of the Tyne piers, for the following notes of his experience at that work. "On the Tyne Pier works helmet and bell divers are employed simultaneously—the former for excavating for and fixing the feet of the piles of which the staging is formed, the bell divers for levelling the foundations and fixing the blocks of which the pier is composed. The helmet diver has greatest power in lifting. He can exert but a few pounds of force in pulling downwards (unless he can fasten himself down) on account of his buoyancy, and for the same reason he cannot pull or push horizontally with much force unless he has a fulcrum or stop for his feet or body. Thus, in boring an augur hole in a pile he would have to lash himself to it, unless there was a projecting rock or stone that he could get his foot against. In the use of a hammer and other tools for striking he is restricted by the water," but Mr Messent has known good men do fair work with a hammer and chisel. It is difficult for them to walk against even a moderate tide, and men who by accident get on the (lee) tide side of their work, generally have to be hauled up to their boat and lowered down again in order to get on the (windward) tideward side of it; again experience enables many of these difficulties to be met or modified, but it is advantageous to bear them in mind in arranging work for divers. Most of the divers at the Tyne have been made or instructed on the works, and of the men who have tried helmet diving not more than one out of three or four succeed or become divers, the failure being sometimes from physical causes, but more often from want of head. There is less difficulty in making bell-divers, probably on account of their working in company, there being always two men in a bell, and the same amount of self-reliance is not needed.

¹ Reports by Captain James B. Eads to the President and Directors of the Illinois and St Louis Bridge Company.

³ Minutes of Proceedings of Inst. of Civil Engineers, vol. xlv. p. 343.

The practice of diving obliges the diver to conduct his work under a pressure greater than that of the atmosphere at the surface of the earth. All diving work is done under an abnormal atmospheric pressure, which increases with the depth at which the diver is submerged in water. This pressure, when he is submerged to the depth of 33 feet, is twice that of the normal superficial atmospheric pressure. At greater depths the pressure is proportionately increased, and ultimately becomes so great that life could not be maintained. To descend even to the moderate depth of 30 or 40 feet, which is about the maximum required for ordinary engineering sea works, demands some practice and nerve on the part of the diver, but when greater depths have to be explored, in raising sunk vessels, for example, the energy and power of endurance of the diver are much more severely taxed, and it seems not uninteresting, before concluding this article, to refer to the effect which the work has on the health of the diver, as well as on some physiological facts of interest in general science.

The sensations experienced in a diving bell are common, it is believed, to all divers. According to the writer's experience, very soon after the lips of the bell have touched the surface of the water pain is felt in the ears and above the eyes, which continues with greater or less intensity according to the rate of descent until the bell has attained the bottom. So long as the bell continues there no pain is felt, the only feeling being that of depression due to the depth to which the diver is submerged. As soon as the upward movement commences the pain in the ears and above the eyes returns, and continues till the surface is reached. The motion of the bell is very gradual, sometimes not exceeding 3 feet per minute, but even at that slow rate the head does not accommodate itself to the increase of pressure so as to avoid inconvenience. Aeronauts do not suffer to the same extent in their ascents in balloons, because the alteration of pressure is much more gradual in passing through the atmosphere than through a medium having the density of water.

Several suggestions have been offered as accounting for the sensations which are experienced in diving, and the following explanation, which the author has submitted to Professor Turner of Edinburgh, is believed to afford the true solution.

Under the ordinary atmospheric conditions, the air presses not only on the surface of the body, but into every cavity within the body which communicates with the surface, so that the pressure, both externally and internally, is exactly balanced. In passing into a denser atmosphere the increased pressure operates externally more rapidly than it does internally, more especially if the communication of the internal cavities with the surface is by tortuous passages; and so long as this inequality in the pressure exists the disagreeable sensations in the ears and above the eyes will continue. The pain in the ears arises from the effect of the condensed air acting externally on the tympanic membrane of the ear, before the air within the tympanic cavity has acquired the same density to counter-balance it. The tympanic membrane stretches across the bottom of the passage or meatus, which leads from the outer ear into the side of the head (see *ANATOMY*, fig 80.) This passage is in direct communication with the atmosphere, the pressure of which, therefore, acts instantaneously on the tympanic membrane. But on its inside the tympanic membrane bounds the tympanic cavity, which has no communication with the external air, excepting by the Eustachian tube, which leads from the cavity into the pharynx immediately behind the nose. Through this tube, therefore, the condensed air must pass from the pharynx to supply what is necessary within the cavity for restoring the same equilibrium within and without. But the

Eustachian tube is a long and narrow passage; at its commencement in the ear it has a bony structure, but towards its termination in the pharynx behind the nostrils, it becomes soft, so that its walls can be forced together. It admits an easy passage from the ear to the pharynx; but when any pressure arises in the opposite direction, it acts in some degree like a valve, shutting the passage, until the increasing pressure again forces it open. Some time then elapses before all this can be accomplished; and during this time the external air, pressing with full force on the tympanic membrane, produces the pain which is felt. When the Eustachian tube opens, it is generally all of a sudden, and with a slight explosion or pop, which is followed by instant relief from the pain. This relief may often be produced by filling the mouth, or gulping the air and passing it into the tube.

That the above is what really takes place may be shown experimentally by shutting the mouth and nostrils, and exhausting the air from them by the action of the lungs. The air in the tympanic cavity immediately rushing through the Eustachian tube into the mouth, the external air acts on the tympanic membrane and produces a slight sensation of deafness, such as is felt in the bell. But if, instead of exhausting the air, we attempt to compress it, and force it through the tube into the tympanic cavity, at first no effect is produced; but after exerting a considerable pressure a slight pop is felt, and a little pain in the ear, which is just the sudden opening of the tube.

The pain above the eyes is doubtless due to the inequality between the pressure of the air on the surface of the forehead and that of the air in the frontal sinuses, or air spaces in the frontal and other bones which form the boundaries of the orbits. The return of the disagreeable sensations during the upward ascent of the bell is due to the pressure on the outer surface of the tympanic membrane and of the forehead being diminished, before the air within the tympanic cavity and the air spaces in the bones of the orbits has accommodated itself to the diminished external pressure.

It may further be interesting to notice that any upward motion is accompanied by a thick mist within the bell, which disappears when it is stationary or moving downwards. The explanation is that the air inside the bell, when it is ascending, being relieved of pressure, expands, and its temperature is lowered; and as the air inside is about the point of saturation, the fall of temperature produces condensation, which becomes visible in the form of vapour or mist. An analogous phenomenon takes place in commencing to exhaust the receiver of an air-pump.

The question of the effect produced on the health of the men employed in diving is of interest and importance. So far as the author's experience goes, he is not aware that divers suffer from prosecuting their submarine work under the pressure of one or two atmospheres to which they are subjected in ordinary harbour works, the men selected for such duty being generally healthy young men of athletic make. Indeed, it is well known that to some constitutions, and in some forms of disease, subjection to moderate increase of atmospheric pressure proves beneficial. But when greater depths and high pressures have to be sustained the case may be very different.

Mr Siebe, who states the greatest depth to which a diver has descended to be 201 feet, with a pressure of 87 lb on the square inch (but who states 150 feet as the limit for safe work), has given various directions, the result of his experience, as to the selection of men for deep diving, and advises that men should not be employed who are of full habit of body, who suffer from headache or deafness, who have at any time had spitting of blood or palpitation of the heart, who are pale and whose circulation is languid,

Effect of diving on the health of the divers.

or who are of intemperate habits. He also says that the rate of descent and ascent must depend very much on the constitution and experience of the diver, about 2 feet a second for a strong man for depths not exceeding 80 feet, and for descending to greater depths additional care must be used. The greatest pressures to which men are subjected in engineering works are experienced in the compressed air cylinders used in bridge building (see article BRIDGE). At Saltash bridge it was found that the men could not work long shifts at the depth of 86 feet without serious inconvenience—some of them, after working seven hours, being slightly paralyzed, but in two or three days they quite recovered. With three hours' shifts the men could work for several months consecutively.

At Londonderry bridge, where the men wrought under a pressure of 75 feet, or about two atmospheres, Sir John Hawkshaw found that there was considerable difference in the relative ability of men to stand the pressure. He had found Irishmen less able to stand the work than Englishmen, one of the effects being that the joints began to swell. In other cases no evil resulted.

Captain Eads, the engineer of the St Louis bridge, built across the Mississippi in 1870, gives some interesting information, in his reports to the directors of the Illinois and St Louis Bridge Company, on the effect of working under high pressure on the men. The maximum depth to which the cylinders had to be sunk was 110½ feet below summer water level, and the greatest pressure under which the men worked was 50 or 51 lb on the square inch. When the depth of 60 feet had been reached some of the men were affected by paralysis of the lower limbs, which usually passed off in a day or two. At greater depths the symptoms were more severe. The duration of working in the air chamber was gradually shortened from four hours to one hour. The total number of men employed in working under pressure was 352, of whom 30 were seriously affected and 12 cases proved fatal. (D. S.)

DIVISION. See Logic.

DIVORCE is the dissolution of the relationship of marriage. Few social questions are surrounded with greater difficulty than this. For what causes divorce should be granted, and whether complete divorce should be granted at all in the sense of authorizing the spouses to contract new marriages, are points on which civilized societies have arrived at very different conclusions. Modern practice and opinion are to be traced mainly to two sources of principle, viz., Roman law and the Christian religion. The effect of the spread of Christianity was to reinvest marriage with the religious character from which in the later law of Rome it had completely escaped; and the history of divorce in modern times has been the gradual decay of the restrictions which were thought appropriate to the religious character of the institution of marriage. At the same time these restrictions have nowhere disappeared. The opinion of society visibly fluctuates between the belief that marriage is a civil contract only and the belief that it is a contract of a peculiarly sacred character, the dissolution of which must not be lightly, if at all, permitted by human legislation. Again, divorce appears to be regarded sometimes as a penalty against the offending spouse, sometimes as a right to which the innocent spouse is entitled. It will be granted only if a matrimonial offence is proved to have been committed, but it will not be granted if such an offence has been committed on both sides. Hence a certain amount of inconsistency in legislation about divorce, which is in no system more remarkable than in our own, founded as it is on the doctrines of the canon law, modified by the opinions of secular judges, and altered by Acts of Parliament.

In Roman law marriage was regarded as a voluntary union which might be terminated at any time by the

consent of the parties. No legal process was required, although the abuse of the power of divorce was sometimes punished. If a wife had not passed under the *manus* of her husband, her father might withdraw her from the union against the wishes of both parties. A constitution of Antoninus Pius limited this power. Until the time of Justinian divorce by consent of both parties does not appear to have been subject to any restriction. Justinian, however, allowed it only in three specified cases, viz., for impotency, or when either party desired to enter on a monastic life or was for a long time in captivity. "At a later period Justinian enacted that persons dissolving a marriage by mutual consent should forfeit all their property and be confined for life to a monastery, which was to receive a third of the forfeited property, the remaining two-thirds going to the children of the marriage. This severity, so much at variance with the Roman spirit, indicates the growing power of the clergy (*ut non Dei judicium contemnatur*)." (Hunter's *Roman Law*, p. 500) These prohibitions were repealed in the next reign. Divorce by the husband against the wish of his wife was a power much more likely to be abused than that of dissolving marriage by mutual consent. Although the legal right was recognized, it is said not to have been acted on for a period of 500 years, and Spurius Carvilius is said to have been the first who put away his wife for barrenness. Harshness in the exercise of the power was condemned by public opinion, and sometimes punished by the authority of censors. L. Antonius, a senator, was expelled from the senate for a harsh divorce of a young wife. The wife who had not come under the *manus* of the husband had the same power of repudiating the marriage at will. Later legislation curbed this excessive licence. By the *lex Julia et Papia Poppæa*, a husband divorcing a wife for adultery might retain one-sixth of her dowry; for any smaller offence, only one-eighth. When a husband was guilty of adultery he had to repay the dowry at once; if the fault were less serious, in six months. Constantine allowed the wife to divorce the husband in the following cases:—1, for murder; 2, for being a preparer of poison; 3, for violating tombs. Just causes for repudiation by the husband were—1, adultery, 2, preparing poisons; 3, being a procuress. A wife divorcing her husband for other than the specified grounds forfeited the dowry, and might be punished by deportation. Similarly a husband lost his interest in the dowry of his wife by an injurious divorce. Similar provisions are to be found in the legislation of Honorius and Theodosius (421 A.D.), of Theodosius and Valentinian (449 A.D.) Justinian settled the grounds of divorce as follows:—The wife could divorce her husband—1, for conspiracy against the empire; 2, attempting her life; 3, attempting to induce her to commit adultery; 4, wrongfully accusing her of adultery, 5, taking a paramour to his house or frequenting any other house in the same town with a paramour. On a divorce for these reasons a wife recovered her dowry, and obtained the husband's portion as well. If she divorced for other reasons she forfeited her dowry, and could not marry for five years, as in the legislation of Theodosius and Valentinian. So a husband might justly divorce his wife for—1, concealment of plots against the empire; 2, adultery, 3, attempting her husband's life, or concealing plots against him, 4, going to baths or banquets with other men; 5, remaining from home against her husband's wish; 6, going to circus, theatre, or amphitheatre against his wish. In such cases the husband retains the dowry for life, or if he has no children absolutely. In other cases penalties as fixed by previous legislation of Theodosius and Valentinian apply. The grounds for divorce specified in these various enactments are an interesting commentary on contemporary manners.

These experiments in divorce legislation display anxiety to regulate the relationship of marriage as a purely civil institution, with a view mainly to public decorum and the comfort of individuals. When marriage had manifestly failed it was no longer worth preserving, and it had failed when either of the parties showed a desire to withdraw from the alliance. At the same time an innocent party must be protected against the caprices of an unjust spouse, and such protection was sought by the device just described. It is a remarkable illustration of the Roman view of marriage that, in view of what must have been the great social evil of capricious divorce, the right of either party to dissolve the marriage was never successfully questioned. From the pure Roman to the canon law the change is great indeed. The ceremony becomes sacred, the tie indissoluble. Those whom God hath joined let not man put asunder, was the first text of the new law of marriage, and against such a prohibition social convenience and experience pleaded in vain. While marriage once created became indissoluble, the impediments to marriage also multiplied. The canon law annulled a marriage *ab initio* for causes which we should now consider wholly inadequate. The tie of consanguinity was extended to the eighth generation; and affinity, it was held, might be established by adulterous intercourse without marriage. The power of dispensing with canonical disabilities, and the power of annulling marriage on the ground of such disabilities, belonged to the church, and were important aids to its influence in society. In countries which have embraced the doctrines of the Reformation, a relaxation of the law of divorce has generally followed the changes of religion—whether immediately, as in Scotland, or indirectly, as in England. In Roman Catholic countries the theory of the canon law still rules.

The history of divorce in English law is particularly interesting. Down to the passing of the Divorce Act of 1858, the theory of the law of England was the same as the theory of the Roman Church. There were attempts during the period of the Reformation to introduce a greater licence of divorce, and in the *Reformatio Legum Ecclesiasticarum* (a code of ecclesiastical law projected by a royal commission, but never enacted) the leaders of the Reformation sanctioned principles which would even now be considered liberal. Divorce was to be granted for adultery, and the innocent spouse was to be permitted to marry again. Other grounds for divorce were specified, such as desertion and continued absence, and savageness of temper. Separation *a mensa et thoro* was to be superseded by this more complete remedy. And the more advanced Reformers advocated even greater liberty of divorce. The nature of their proposals, and the arguments by which they reconciled them with the language of Scripture, may be studied in Milton's tractate on the *Doctrine and Discipline of Divorce*, addressed to the Parliament of England. But the law remained unchanged. The constitution of marriages belonged to the jurisdiction of the ecclesiastical courts. The tie was indissoluble. The marriage, indeed, might be declared null and void in certain cases, *e.g.*, where the parties were within the prohibited degrees of consanguinity or affinity. This proceeding was not a dissolution of marriage so much as a declaration that no real marriage had taken place between the parties. Divorce *a mensa et thoro* was granted for adultery and cruelty. Here the marriage, being originally good, was not dissolved, but a separation was ordered either for a limited or an indefinite time. The spouses were not permitted to marry again. But while the law remained unchanged, the practice of granting complete divorces by private Acts of Parliament had come into existence. The legislature did in particular cases that which it refused to do by a general law. Two conditions were in general necessary to satisfy Parliament.

1st, A divorce *a mensa et thoro* had to be obtained from the ecclesiastical court. 2d, An action for damages had to be brought against the adulterer in the civil court for criminal conversation. The latter was not absolutely necessary, and appears to have been regarded as a safeguard against divorce being granted to persons who had connived at the acts of adultery, or had themselves been guilty of misconduct in the marriage state. The passing of these Acts through Parliament became a matter of as much formality as a proceeding in an ordinary law court. The two Houses passed standing orders on the subject, under which bills on divorce were argued before the law lords by professional advocates, and generally neither the House of Commons nor the lay lords interfered. By this characteristic evasion, the law of England completely changed its practice while still maintaining its ancient theory of divorce. Probably the anomalous character of the remedy might not have brought about a change but for the great practical evil of the expense attending the proceedings. Three suits—ecclesiastical, civil, and parliamentary—were necessary. Divorce became a remedy for the rich. The poor were driven to bigamy.¹ Yet it was not until 1857—and not then without determined resistance—that this disgraceful state of things was changed. A commission appointed in 1850 recommended the establishment of a regular court for divorce, and that divorce should be granted for the wife's adultery but not for the husband's unless aggravated by other offences. Bills constructed on these principles were introduced into Parliament, and successively abandoned or lost, until in 1857 the ministry of the day by great exertions carried the bill which is now the Act of 20 and 21 Vict. c. 85. Notwithstanding the hostility it excited, the bill proposed little more than a consolidation of jurisdictions; and proceedings in the Divorce Court have now, with few exceptions, the same object and result as the former proceedings in Parliament and in the civil and ecclesiastical courts. The action for damages for criminal conversation is represented by the adulterer being made a party to the husband's suit. Full divorce is granted on the principles usually recognized by the House of Lords; and the other remedies are such as might formerly have been granted by the ecclesiastical court.

The following statement embraces the most important provisions of the Act:—

All jurisdiction in matters matrimonial (*i.e.*, in respect of divorces *a mensa et thoro*, suits of nullity of marriage, of jactitation of marriage, for restitution of conjugal rights, &c.), shall cease to be so exercisable, and shall in future be exercised by a new court, to be called the "Court for Divorce and Matrimonial Causes." The Lord Chancellor and other judges are named as members of this court, along with the judge of the new constituted Court of Probate, who is to be the judge ordinary of the new court. Divorce *a mensa et thoro* is under that name abolished, but a new remedy called judicial separation is introduced, which shall have the same effect, and such other legal effect as in the Act mentioned. This remedy may be obtained by either husband or wife, on the ground of adultery or cruelty, or desertion without cause for two years and upwards. At the same time it is provided that a wife deserted by her husband may apply to a police magistrate or justice of the peace for a protection order, by which her earnings and property acquired since the

¹ The satirical address of Mr Justice Maule to a poor man convicted of bigamy, in 1845, put the absurdities of the existing law in a way not likely to be forgotten. The prisoner's wife had robbed him and ran away with another man. "You should have brought an action," he told him, "and obtained damages, which the other side would probably not have been able to pay, and you would have had to pay your own costs, perhaps a hundred or a hundred and fifty pounds. You should then have gone to the ecclesiastical courts, and obtained a divorce *a mensa et thoro*, and then to the House of Lords, where, having proved that these preliminaries had been complied with, you would have been enabled to marry again. The expense might amount to five or six hundred or perhaps a thousand pounds. You say you are a poor man. But I must tell you that there is not one law for the rich and another for the poor."

commencement of the desertion may be protected from her husband and his creditors, and belong to herself as if she were an unmarried woman. In all cases except dissolution of marriage, the divorce court shall act on "principles and rules which in the opinion of the said court shall be as nearly as may be conformable to the principles and rules on which the ecclesiastical courts have heretofore acted," subject of course to the rules and orders under the Act. Where a decree of separation has been obtained, in the absence of the husband or wife, as the case may be, it may be reversed on proper cause shown. In the case of judicial separation, the wife shall be treated in respect of any property she may acquire as if she were an unmarried woman; on her death it will descend as it would have done if her husband were dead; and should she again cohabit with her husband, any property she may be entitled to shall be held to her separate use, subject to any agreement she may have made with her husband when separated. So also a judicially separated wife should be treated as an unmarried woman for purposes of contract and in civil proceedings generally. The most important section of the Act is that under which a marriage may be dissolved. "It shall be lawful for any husband to present a petition to the said court praying that his marriage may be dissolved on the ground that his wife has since the celebration thereof been guilty of adultery; and it shall be lawful for any wife to present a petition to the said court, praying that her marriage may be dissolved, on the ground that since the celebration thereof her husband has been guilty of incestuous adultery, or of bigamy with adultery, or of rape, or of sodomy, or bestiality, or of adultery coupled with such cruelty as, without adultery, have entitled her to a divorce *a mens et thoro*, or of adultery coupled with desertion without reasonable excuse for two years and upwards." Incestuous adultery includes adultery committed with a woman within the prohibited degrees of consanguinity and affinity. On a husband's petition for divorce the alleged adulterer must be made a co-respondent, unless the court permits otherwise, and one of the parties may insist on trial by jury. And the court is to take special care to satisfy itself, not only as to the fact alleged, but as to the existence of anything like connivance or condonation on the part of the petitioner; and it shall inquire at the same time into any counter charge made against the petitioner. When the court is not satisfied as to the facts, or finds connivance or condonation or collusion, the petition must be dismissed. If the court is satisfied on these points, a decree dissolving the marriage may be pronounced; but the court shall not be bound to pronounce such decree, if it finds that the petitioner has been guilty of adultery, or unreasonable delay in prosecuting the suit, or of cruelty, or desertion, or such neglect and misconduct as has conduced to the adultery. The court may decree the payment of alimony by the husband to the wife. The husband may in his petition claim damages against the co-respondent, and such claim shall be tried according to the same or like rules and regulations as actions for criminal conversation at common law, and the damages shall in all cases be ascertained by a jury, but the court has power to direct the application of the damages, in whole or part, to the benefit of the children of the marriage, or the maintenance of the wife. And the co-respondent, if the case is established against him, may be ordered to pay the whole or any part of the costs. In proceedings for judicial separation, or nullity or dissolution of marriage, the court may make interim or final orders as to the custody and maintenance of the children. Questions of fact may be tried before the court itself or a jury, or issues of fact may be directed by the common law court. Every petitioner in a case of judicial separation, nullity, dissolution, or annulment of marriage, must file an affidavit verifying his petition, and stating that there has been no collusion. In any case of divorce or judicial separation for wife's adultery, the court may order the settlement of any property to which the wife may be entitled, for the benefit of the innocent party or the children of the marriage. Appeals may be made from the judge ordinary, within three months, to the full court, and from that court to the House of Lords. By the 57th section, after a dissolution of marriage, "it shall be lawful for the respective parties thereto to marry again, as if the prior marriage had been dissolved by death." Here follows a singular compromise, marking the conflict of opinions through which the Act had to pass. No clergyman of the United Church of England and Ireland shall be compelled to solemnize the marriage of any person whose former marriage has been dissolved on the ground of his or her adultery, or shall be liable to any penalty for refusing to do so. But any minister of a church or chapel so refusing to solemnize the marriage of persons who would otherwise have been entitled to have the service performed in such church or chapel shall permit any other clergyman of the same diocese to perform such marriage in such church or chapel. The common law action for criminal conversation is abolished.

Acts amending the Divorce Act were passed in 1858, 1859, 1860, 1864, 1866, 1868, and 1873. The Amendment Act of 1859, by a most unhappily worded section, gives power to the court, after a decree of nullity or dissolution, to revise the marriage settlements, and apply the property to the benefit of the "children of the marriage or

their respective parents." It has been held that the court has no power to alter settlements unless there are children of the marriage alive at the date of the order. This Act also makes husband and wife competent and compellable to give evidence touching cruelty or desertion in a wife's petition for dissolution of marriage.

The Act of 1850 contains the following important clause (§ 7) "Every decree for a divorce shall in the first instance be a decree, *nisi*, not to be made absolute till after the expiration of such time, not less than *three months* from the pronouncing thereof, as the court shall by general and special order from time to time direct, and during that period any person shall be at liberty to show cause why the said decree should not be made absolute, by reason of the same having been obtained by collusion, or by reason of material facts not having been brought before the court; and on cause being so shown, the court shall deal with the case by making the decree absolute, or by revising the decree *nisi*, or by requiring further inquiry or otherwise as justice may require; and at any time during the progress of the cause, or before the decree is made absolute, any person may give information to her Majesty's proctor of any matter material to the due decision of the case, who may thereupon take such steps as the attorney-general may deem necessary or expedient; and if from any such information or otherwise the said proctor shall suspect that any parties to the suit are, or have been, acting in collusion for the purpose of obtaining a divorce contrary to the justice of the case, he may, under the direction of the attorney-general, and by leave of the court, intervene in the suit, alleging such case of collusion, and retain counsel and subpoena witnesses to prove it." This clause is a most important addition to the securities against collusive suits provided by the earlier Acts. The period of three months has been extended to six by the Act of 1866. These sections have been extended by the Act of 1873 to cases of nullity of marriage. The other provisions of the various amending Acts do not call for notice here.

One or two points in the above summary may be further explained. The greater favour shown to husbands' petitions for divorce than to wives' follows with tolerable closeness the principles on which the House of Lords acted in passing private bills. The reason why the adultery of the husband is considered a less serious offence than the adultery of the wife will be obvious to every one. As a matter of fact, wives' bills for divorce before Parliament were comparatively few, and some circumstance of aggravation was required. The first divorce granted to a wife by Parliament was in Addison's case in 1801, and the decision was mainly brought about by the masterly speech of Lord Thurlow. It may be added that Parliamentary bills for divorce were not common until the 18th century. After the accession of the house of Hanover they became frequent.

The right to a divorce or separation on any of the grounds mentioned may be avoided by conduct on the part of the petitioner amounting to what is called condonation, or forgiveness, e.g., if after the offence complained of the parties resume cohabitation. But the offence condoned may be revived, that is, the original right to sue thereon may be restored by a repetition of the offence. Thus a new act of adultery will revive a condoned adultery. So with an act of cruelty. It was also held in the ecclesiastical courts, and appears to be the law, that cruelty would revive adultery, and *vice versa*. The question then arose whether an act of cruelty could revive an old condoned act of adultery, or *vice versa*, so that the two might be pleaded together by the wife in support of her petition for dissolution of marriage. The remedy may also be barred by the *connivance* of the petitioner, i.e., his consent, express or implied, to the adultery of the spouse; and also by *collusion*, i.e., a conspiracy between the parties, or between one of them and a third party, to obtain a sentence of divorce or separation. The mere fact that both parties desire the same end is not of itself collusion. But where they combine to bring about the offence, or to produce evidence from which the offence may be inferred, or to deceive the court by the suppression of material facts or otherwise, they are guilty of collusion. Recrimination under the old ecclesiastical law is where the respondent retorts by imputing to the petitioner conduct similar to

that complained of. He must come into court with clean hands, and if he has himself been guilty of adultery he cannot obtain a sentence against his wife for adultery. Recrimination ought strictly to be of an offence of the same nature as the one complained of; the petitioner is said to have *compensatio in eodem delicto*. But under the 31st section of the new Act above referred to, adultery, cruelty, unreasonable delay, desertion, and misconduct conducing to adultery are made discretionary bars to divorce,—that is, if they are proved, the court is not bound to pronounce the sentence of dissolution which would otherwise follow on proof of the respondent's adultery. In a recent case, where the respondent had previously obtained a decree of judicial separation on the ground of desertion, the husband's petition for dissolution of marriage on the ground of the wife's adultery was rejected by the court.

The matrimonial suits inherited by the Divorce Court from the old ecclesiastical courts are those for nullity of marriage, for restitution of conjugal rights, and for jactitation of marriage. These suits must be decided according to the principles of the canon law as administered in the English ecclesiastical courts. A marriage will be declared null *ab initio* when the requisites of a legal marriage have not been complied with. The alleged defect must have existed at the time of the celebration of the marriage. The formal requisites are (1) that the marriage should be celebrated in pursuance of a special licence, ordinary licence, publication of banns, superintendent-registrar's licence or certificate, in the presence of a person in holy orders, or a registrar; and (2) in a parish church or public chapel, or superintendent-registrar's office, or in some building registered for the solemnization of marriages, except when solemnized by special licence (see MARRIAGE.) These rules only apply to marriages in England, and a marriage is void only when the requisites are deficient, and known to both parties to be deficient, at the time of the ceremony. The two other requisites apply to all marriages, and if they are wanting the marriage is absolutely void:—(1), The marriage must be between single persons, not being within the prohibited degrees of consanguinity and affinity, and who are (2) consenting and of a sound mind, and able to perform the duties of matrimony. The "prohibited degrees" are those set forth in the common prayer book, and extend to illegitimacy as well as legitimate relations. The ecclesiastical courts had been in the habit of annulling such marriages previous to the 5 and 6 Will. IV. c. 54, and until so annulled, in the lifetime of the parties, they were regarded as voidable only, and not void. That enactment, however, while ordering that marriages already celebrated "between persons within the prohibited degrees of affinity" shall not be annulled for that cause only by the ecclesiastical courts, goes on to declare that all marriages which shall thereafter "be celebrated between persons within the prohibited degrees of consanguinity and affinity shall be absolutely null and void to all intents and purposes whatever." As to the second requisite, fraud, force, or duress, showing the absence of consent, will make void the marriage. Insanity at the time of the marriage has the same effect. A marriage may also be annulled for bodily incapacity existing at the time of the marriage, and proved to be incurable.

In a petition for restitution of conjugal rights, the marriage must be proved, and it must be shown that the respondent has withdrawn without reasonable cause from cohabitation with the other spouse. The court can only order husband and wife to live under the same roof. The petitioner will be refused a decree for restitution if he has himself committed any matrimonial offence which would be a ground for judicial separation.

Jactitation of marriage is when "one party boasts or gives out that he is married to the other, whereby a common

reputation of their marriage may ensue." Suits for jactitation are not now common. The only remedy of the court is to decree perpetual silence against the jactitator.

Scotch Law—Divorce for adultery has been recognized in Scotland since the Reformation. It appears not to have been introduced by any statute, but to have been assumed by the post-Reformation judges as the common law. In another point the law of Scotland is in advance of the law of England. Divorce for adultery is competent to either spouse. Malicious desertion is also a ground for divorce. This was enacted by a statute of 1573, c. 55. A previous action of adherence was formerly necessary, but is now abolished by the Conjugal Rights Act 1861 *infra*. Recrimination is no bar to an action for divorce in Scotland, but any ground which would satisfy a decree of judicial separation would have been a defence to the old action for adherence. Judicial separation is granted for cruelty and adultery; the party injured by the adultery of the other spouse may choose either judicial separation or divorce. The cruelty required to justify judicial separation must, as in England, be of a somewhat aggravated character. Divorce in Scotland had the effect of remitting the parties to the status of unmarried persons. The law, however, made one exception. A divorced person was not allowed to marry the paramour, at all events if the paramour was named in the decree, and for this reason the name of the paramour is sometimes omitted, so that the parties may be allowed to marry if they wish.

By the Conjugal Rights (Scotland) Amendment Act 1861, provisions similar to those of the English Divorce Acts were established. A deserted wife may apply to the Court of Session for an order to protect any property which she has or may acquire by her own industry, or may succeed to, and such order of protection, when made and intimated, shall have the effect of a decree of separation *a mensa et thoro* in regard to the property rights and obligations of the husband and of the wife, and in regard to the wife's capacity to sue and be sued. When a wife obtains a decree of separation *a mensa et thoro*, all property she may acquire shall be considered as property belonging to her, in reference to which the husband's *jus mariti* and right of administration are excluded; she may dispose of it in all respects as if she were unmarried, and if she dies intestate it will pass to her heirs and representatives, as if her husband had been dead. A wife so separated shall be capable of entering into obligations, and of suing and being sued, as if she were not married, and the husband shall not be liable for her obligations, &c., except when separation aliment has been ordered to be paid to the wife, and remains unpaid, in which case he shall be liable for her necessities. In a husband's action for adultery, the alleged adulterer may be cited as co-defender, and the expenses of process taxed as between agent and client may be charged upon him if the adultery is proved. The co-defender may be examined as a witness, and he may be dismissed from the cause, if the court is satisfied that such a course is conducive to the justice of the case. The Lord Advocate may enter appearance in any action of nullity of marriage or divorce. In any consistorial action, the summons shall be served personally on the defender when he is not resident in Scotland, but if the court is satisfied that he cannot be found, edictal citation will be sufficient, provided that the pursuer shall also serve the summons on the children and the next of kin of the defender other than the children, when they are known and resident within the United Kingdom, and they, whether they are cited or so resident or not, may appear and state defences to the action. By sect. xi. it shall not be necessary prior to any action of divorce to institute against the defender any action of adherence, nor to charge the defender to adhere to the pursuer, nor to denounce the defender, nor to apply to the presbytery of the bounds or any other judicature to admonish the defender to adhere. Proofs in consistorial actions are in future to be taken before the Lord Ordinary. Consistorial actions are defined in the Act as including actions of declaration of marriage, of nullity of marriage, and of legitimacy and bastardy, actions of separation *a mensa et thoro*, of divorce, and of adherence and of putting to silence, and actions of aliment between husband and wife instituted in the court of session.

United States—The matrimonial law of England, as at the time of the declaration of independence, forms part of the common law of the United States. But as no ecclesiastical courts have ever existed there, the law must be considered to have been inoperative. There is no national jurisdiction in divorce, and though it is competent to Congress to authorize divorces in the Territories, still it appears that this subject like others is usually left to the territorial legislature. In the different States, as in England, divorces were at first granted by the legislatures, whether directly or by granting special authority to the tribunals to deal with particular cases. This practice has, it appears, fallen into general disrepute, and by the constitution of some States legislative divorces are expressly prohibited. Apart from such express prohibitions, it has been contended that legislative divorces are debarred by general clauses in the constitution of the United States, or in the constitution of particular States. Thus the con-

commencement of the desertion may be protected from her husband and his creditors, and belong to herself as if she were an unmarried woman. In all cases except dissolution of marriage, the divorce court shall act on "principles and rules which in the opinion of the said court shall be as nearly as may be conformable to the principles and rules on which the ecclesiastical courts have heretofore acted," subject of course to the rules and orders under the Act. Where a decree of separation has been obtained, in the absence of the husband or wife, as the case may be, it may be reversed on proper cause shown. In the case of judicial separation, the wife shall be treated in respect of any property she may acquire as if she were an unmarried woman; on her death it will descend as it would have done if her husband were dead, and should she again cohabit with her husband, any property she may be entitled to shall be held to her separate use, subject to any agreement she may have made with her husband when separated. So also a judicially separated wife should be treated as an unmarried woman for purposes of contract and in civil proceedings generally. The most important section of the Act is that under which a marriage may be dissolved. "It shall be lawful for any husband to present a petition to the said court praying that his marriage may be dissolved on the ground that his wife has since the celebration thereof been guilty of adultery; and it shall be lawful for any wife to present a petition to the said court, praying that her marriage may be dissolved, on the ground that since the celebration thereof her husband has been guilty of incestuous adultery, or of bigamy with adultery, or of rape, or of sodomy, or bestiality, or of adultery coupled with such cruelty as, without adultery, have entitled her to a divorce *a mensa et thoro*, or of adultery coupled with desertion without reasonable excuse for two years and upwards." Incestuous adultery includes adultery committed with a woman within the prohibited degrees of consanguinity and affinity. On a husband's petition for divorce the alleged adulterer must be made a co-respondent, unless the court permits otherwise, and one of the parties may insist on trial by jury. And the court is to take special care to satisfy itself, not only as to the fact alleged, but as to the existence of anything like connivance or condonation on the part of the petitioner, and it shall inquire at the same time into any counter charge made against the petitioner. When the court is not satisfied as to the facts, or finds connivance or condonation or collusion, the petition must be dismissed. If the court is satisfied on these points, a decree dissolving the marriage may be pronounced, but the court shall not be bound to produce such decree, if it finds that the petitioner has been guilty of adultery, or unreasonable delay in prosecuting the suit, or of cruelty, or desertion, or such neglect and misconduct as has conducted to the adultery. The court may decree the payment of alimony by the husband to the wife. The husband may in his petition claim damages against the co-respondent, and such claim shall be tried according to the same or like rules and regulations as actions for criminal conversation at common law, and the damages shall in all cases be ascertained by a jury, but the court has power to direct the application of the damages, in whole or part, to the benefit of the children of the marriage, or the maintenance of the wife. And the co-respondent, if the case is established against him, may be ordered to pay the whole or any part of the costs. In proceedings for judicial separation, or nullity or dissolution of marriage, the court may make interim or final orders as to the custody and maintenance of the children. Questions of fact may be tried before the court itself or a jury, or issues of fact may be directed by the common law court. Every petitioner in a case of judicial separation, nullity, dissolution, or jactitation of marriage, must file an affidavit verifying his petition, and stating that there has been no collusion. In any case of divorce or judicial separation for wife's adultery, the court may order the settlement of any property to which the wife may be entitled, for the benefit of the innocent party or the children of the marriage. Appeals may be made from the judge ordinary, within three months, to the full court, and from that court to the House of Lords. By the 57th section, after a dissolution of marriage, "it shall be lawful for the respective parties thereto to marry again, as if the prior marriage had been dissolved by death." Here follows a singular compromise, marking the conflict of opinions through which the Act had to pass. No clergyman of the United Church of England and Ireland shall be compelled to solemnize the marriage of any person whose former marriage has been dissolved on the ground of his or her adultery, or shall be liable to any penalty for refusing to do so. But any minister of a church or chapel so refusing to solemnize the marriage of persons who would otherwise have been entitled to have the service performed in such church or chapel shall permit any other clergyman of the same diocese to perform such marriage in such church or chapel. The common law action for criminal conversation is abolished.

Acts amending the Divorce Act were passed in 1858, 1859, 1860, 1864, 1866, 1868, and 1873. The Amendment Act of 1859, by a most unhappily worded section, gives power to the court, after a decree of nullity or dissolution, to revise the marriage settlements, and apply the property to the benefit of the "children of the marriage or

their respective parents." It has been held that the court has no power to alter settlements unless there are children of the marriage alive at the date of the order. This Act also makes husband and wife competent and compellable to give evidence touching cruelty or desertion in a wife's petition for dissolution of marriage.

The Act of 1860 contains the following important clause (§ 7). "Every decree for a divorce shall in the first instance be a decree, *nisi*, not to be made absolute till after the expiration of such time, not less than three months from the pronouncing thereof, as the court shall by general and special order from time to time direct, and during that period any person shall be at liberty to show cause why the said decree should not be made absolute, by reason of the same having been obtained by collusion, or by reason of material facts not having been brought before the court; and on cause being so shown, the court shall deal with the case by making the decree absolute, or by revising the decree *nisi*, or by requiring further inquiry or otherwise as justice may require; and at any time during the progress of the cause, or before the decree is made absolute, any person may give information to her Majesty's proctor of any matter material to the due decision of the case, who may thereupon take such steps as the attorney-general may deem necessary or expedient; and if from any such information or otherwise the said proctor shall suspect that any parties to the suit are, or have been, acting in collusion for the purpose of obtaining a divorce contrary to the justice of the case, he may, under the direction of the attorney-general, and by leave of the court, intervene in the suit, alleging such case of collusion, and retain counsel and subpoena witnesses to prove it." This clause is a most important addition to the securities against collusive suits provided by the earlier Acts. The period of three months has been extended to six by the Act of 1866. These sections have been extended by the Act of 1873 to cases of nullity of marriage. The other provisions of the various amending Acts do not call for notice here.

One or two points in the above summary may be further explained. The greater favour shown to husbands' petitions for divorce than to wives' follows with tolerable closeness the principles on which the House of Lords acted in passing private bills. The reason why the adultery of the husband is considered a less serious offence than the adultery of the wife will be obvious to every one. As a matter of fact, wives' bills for divorce before Parliament were comparatively few, and some circumstance of aggravation was required. The first divorce granted to a wife by Parliament was in Addison's case in 1801, and the decision was mainly brought about by the masterly speech of Lord Thurlow. It may be added that Parliamentary bills for divorce were not common until the 18th century. After the accession of the house of Hanover they became frequent.

The right to a divorce or separation on any of the grounds mentioned may be avoided by conduct on the part of the petitioner amounting to what is called condonation, or forgiveness, e.g., if after the offence complained of the parties resume cohabitation. But the offence condoned may be revived, that is, the original right to sue thereon may be restored by a repetition of the offence. Thus a new act of adultery will revive a condoned adultery. So with an act of cruelty. It was also held in the ecclesiastical courts, and appears to be the law, that cruelty would revive adultery, and *vice versa*. The question then arose whether an act of cruelty could revive an old condoned act of adultery, or *vice versa*, so that the two might be pleaded together by the wife in support of her petition for dissolution of marriage. The remedy may also be barred by the connivance of the petitioner, i.e., his consent, express or implied, to the adultery of the spouse; and also by collusion, i.e., a conspiracy between the parties, or between one of them and a third party, to obtain a sentence of divorce or separation. The mere fact that both parties desire the same end is not of itself collusion. But where they combine to bring about the offence, or to produce evidence from which the offence may be inferred, or to deceive the court by the suppression of material facts or otherwise, they are guilty of collusion. Recrimination under the old ecclesiastical law is where the respondent retorts by imputing to the petitioner conduct similar to

that complained of. He must come into court with clean hands; and if he has himself been guilty of adultery he cannot obtain a sentence against his wife for adultery. Recrimination ought strictly to be of an offence of the same nature as the one complained of; the petitioner is said to have *compensatio in eodem delicto*. But under the 31st section of the new Act above referred to, adultery, cruelty, unreasonable delay, desertion, and misconduct conducing to adultery are made discretionary bars to divorce,—that is, if they are proved, the court is not bound to pronounce the sentence of dissolution which would otherwise follow on proof of the respondent's adultery. In a recent case, where the respondent had previously obtained a decree of judicial separation on the ground of desertion, the husband's petition for dissolution of marriage on the ground of the wife's adultery was rejected by the court.

The matrimonial suits inherited by the Divorce Court from the old ecclesiastical courts are those for nullity of marriage, for restitution of conjugal rights, and for jactitation of marriage. These suits must be decided according to the principles of the canon law as administered in the English ecclesiastical courts. A marriage will be declared null *ab initio* when the requisites of a legal marriage have not been complied with. The alleged defect must have existed at the time of the celebration of the marriage. The formal requisites are (1) that the marriage should be celebrated in pursuance of a special licence, ordinary licence, publication of banns, superintendent-registrar's licence or certificate, in the presence of a person in holy orders, or a registrar; and (2) in a parish church or public chapel, or superintendent-registrar's office, or in some building registered for the solemnization of marriages, except when solemnized by special licence (see MARRIAGE.) These rules only apply to marriages in England, and a marriage is void only when the requisites are deficient, and known to both parties to be deficient, at the time of the ceremony. The two other requisites apply to all marriages, and if they are wanting the marriage is absolutely void:—(1), The marriage must be between single persons, not being within the prohibited degrees of consanguinity and affinity, and who are (2) consenting and of a sound mind, and able to perform the duties of matrimony. The "prohibited degrees" are those set forth in the common prayer book, and extend to illegitimate as well as legitimate relations. The ecclesiastical courts had been in the habit of annulling such marriages previous to the 5 and 6 Will. IV. c. 54, and until so annulled, in the lifetime of the parties, they were regarded as voidable only, and not void. That enactment, however, while ordering that marriages already celebrated "between persons within the prohibited degrees of affinity" shall not be annulled for that cause only by the ecclesiastical courts, goes on to declare that all marriages which shall thereafter "be celebrated between persons within the prohibited degrees of consanguinity and affinity shall be absolutely null and void to all intents and purposes whatever." As to the second requisite, fraud, force, or duress, showing the absence of consent, will make void the marriage. Insanity at the time of the marriage has the same effect. A marriage may also be annulled for bodily incapacity existing at the time of the marriage, and proved to be incurable.

In a petition for restitution of conjugal rights, the marriage must be proved, and it must be shown that the respondent has withdrawn without reasonable cause from cohabitation with the other spouse. The court can only order husband and wife to live under the same roof. The petitioner will be refused a decree for restitution if he has himself committed any matrimonial offence which would be a ground for judicial separation.

Jactitation of marriage is when "one party boasts or gives out that he is married to the other, whereby a common

reputation of their marriage may ensue." Suits for jactitation are not now common. The only remedy of the court is to decree perpetual silence against the jactitator.

Scotch Law—Divorce for adultery has been recognized in Scotland since the Reformation. It appears not to have been introduced by any statute, but to have been assumed by the post-Reformation judges as the common law. In another point the law of Scotland is in advance of the law of England. Divorce for adultery is competent to either spouse. Malicious desertion is also a ground for divorce. This was enacted by a statute of 1573, c. 55. A previous action of adherence was formerly necessary, but is now abolished by the Conjugal Rights Act 1861 *infra*. Recrimination is no bar to an action for divorce in Scotland, but any ground which would satisfy a decree of judicial separation would have been a defence to the old action for adherence. Judicial separation is granted for cruelty and adultery; the party injured by the adultery of the other spouse may choose either judicial separation or divorce. The cruelty required to justify judicial separation must, as in England, be of a somewhat aggravated character. Divorce in Scotland had the effect of remitting the parties to the status of unmarried persons. The law, however, made one exception. A divorced person was not allowed to marry the paramour, at all events if the paramour was named in the decree, and for this reason the name of the paramour is sometimes omitted, so that the parties may be allowed to marry if they wish.

By the Conjugal Rights (Scotland) Amendment Act 1861, provisions similar to those of the English Divorce Acts were established. A deserted wife may apply to the Court of Session for an order to protect any property which she has or may acquire by her own industry, or may succeed to, and such order of protection, when made and intimated, shall have the effect of a decree of separation *a mensa et thoro* in regard to the property rights and obligations of the husband and of the wife, and in regard to the wife's capacity to sue and be sued. When a wife obtains a decree of separation *a mensa et thoro*, all property she may acquire shall be considered as property belonging to her, in reference to which the husband's *jus mariti* and right of administration are excluded; she may dispose of it in all respects as if she were unmarried, and if she dies intestate it will pass to her heirs and representatives, as if her husband had been dead. A wife so separated shall be capable of entering into obligations, and of suing and being sued, as if she were not married, and the husband shall not be liable for her obligations, &c., except when separation alimony has been ordered to be paid to the wife, and remains unpaid, in which case he shall be liable for her necessities. In a husband's action for adultery, the alleged adulterer may be cited as co-defender, and the expenses of process taxed as between agent and client may be charged upon him if the adultery is proved. The co-defender may be examined as a witness, and he may be dismissed from the cause, if the court is satisfied that such a course is conducive to the justice of the case. The Lord Advocate may enter appearance in any action of nullity of marriage or divorce. In any consistorial action, the summons shall be served personally on the defender when he is not resident in Scotland, but if the court is satisfied that he cannot be found, edictal citation will be sufficient, provided that the pursuer shall also serve the summons on the children and the next of kin of the defender other than the children, when they are known and resident within the United Kingdom, and they, whether they are cited or so resident or not, may appear and state defences to the action. By sect xi it shall not be necessary prior to any action of divorce to institute against the defender any action of adherence, nor to charge the defender to adhere to the pursuer, nor to denounce the defender, nor to apply to the presbytery of the bonds or any other judicature to admonish the defender to adhere. Proofs in consistorial actions are in future to be taken before the Lord Ordinary. Consistorial actions are defined in the Act as including actions of declaration of marriage, of nullity of marriage, and of legitimacy and bastardy, actions of separation *a mensa et thoro*, of divorce, and of adherence and of putting to silence, and actions of alimony between husband and wife instituted in the court of session.

United States—The matrimonial law of England, as at the time of the declaration of independence, forms part of the common law of the United States. But as no ecclesiastical courts have ever existed there, the law must be considered to have been inoperative. There is no national jurisdiction in divorce, and though it is competent to Congress to authorize divorces in the Territories, still it appears that this subject like others is usually left to the territorial legislature. In the different States, as in England, divorces were at first granted by the legislatures, whether directly or by granting special authority to the tribunals to deal with particular cases. This practice has, it appears, fallen into general disrepute, and by the constitution of some States legislative divorces are expressly prohibited. Apart from such express prohibitions, it has been contended that legislative divorces are debarred by general clauses in the constitution of the United States, or in the constitution of particular States. Thus the con-

stitution of the United States says that no State shall pass a law impairing the obligation of contracts, and it has been argued that this clause prohibits legislative divorces. Bishop states that it "is settled law that legislative divorces are not invalid as impairing the obligation of contracts." Again, some States forbid their legislatures to pass any retrospective laws; and legislative divorce, it has been said, is of the nature of a retrospective statute, and authority on that point seems to be divided. Again, in some States it is contended that a legislative divorce is an infringement of the judicial power, and therefore unconstitutional. The judicial practice throughout the States is to confer jurisdiction in divorce on the courts of equity, to be administered in general accordance with the ordinary rules of equity practice. Each State of course determines for itself the causes for which divorce may be granted, and no general statement of the law can be made. In most States it appears to be allowed, not only for adultery, but for cruelty, wilful desertion, and habitual drunkenness. In New York divorce is allowed only for adultery; in South Carolina not for any cause; in some other States for causes to be determined by the court in the exercise of its discretion. South Carolina, says Bishop (*Marriage and Divorce*, 1873), is the only State in which no divorce, legislative or judicial, has ever for any cause been granted; and he quotes judicial testimony to show that the effect of this state of things is to bring about a partial recognition of concubinage. The proportion of his goods which a married man may leave to his concubine has in fact been fixed by statute. Among the less usual grounds for divorce which have been recognized in particular States, habitual drunkenness has been mentioned above, which has been defined to be a fixed habit of drinking to excess, to such a degree as to disqualify a person from attending to his business during the principal portion of the time usually devoted to business. In Kentucky the offence must be accompanied with a wasting of his estate, and without any suitable provision for the wife and children. Gross neglect of duty, and more particularly neglect or refusal to maintain his wife on the part of a husband having ability to do so, are in some States grounds of divorce. In New Hampshire, if either spouse joins a society believing the relation of husband and wife to be unlawful, and accordingly refuses cohabitation for three years, that is a sufficient ground of divorce, and "the Shakers" have been held to be such a society. In the same State "to be absent and not heard of" for three years is ground for divorce. Conviction for crime is a tolerably common ground. "Gross misbehaviour and wickedness," and "offering indignities to the wife so as to render her condition intolerable and her life burdensome," are also specified causes of divorce in some States. In Missouri and North Carolina it has been held under such a clause that a false accusation of adultery brought by the husband against the wife was a valid ground for divorce; and in Missouri, where the court subsequently held that the statute contemplated indignities to the person only, and not to the mind (as in the case of a false charge), the State legislature amended the statute by specifying as a cause for divorce "the offering such indignities to the other as to make his or her condition intolerable." The effect of this diversity of jurisdictions in producing a conflict of laws is noted below.

France—Freedom of divorce was one of the short-lived results of the French Revolution. The code civil (1803) allowed divorce and judicial separation, although then the advocates of free divorce appear to have desired the exclusion of the latter remedy. The husband might demand divorce for adultery; the wife for adultery when the husband has kept his paramour in the conjugal residence. Either party might demand divorce for outrage, cruelty, or grave injuries (*exces, sévices, ou injures graves*), or on account of condemnation to an infamous punishment. Divorce by mutual consent was also allowed, but under close restrictions as to the age of the parties, the duration of the marriage, the consent of relations, the protection of the children, &c. No new marriage could be made by either party within three years of this divorce. Separation was also allowed as an alternative remedy, but not by consent. When sentence of separation has been pronounced against the wife for adultery, she shall be condemned, on the requisition of a public officer, to confinement in a house of correction for a period of not less than three months, and not more than two years. In 1816 the divorce clauses of the code civil were abolished, but judicial separation was retained. Subsequent attempts to restore freedom of divorce have been unsuccessful.

The law of divorce being thus different in different countries, while people are constantly moving from one country to another, there arises the juridical difficulty of the conflict of laws. A man born in one country, married in a second, and domiciled in a third, may there sue for a divorce on account of a matrimonial offence committed in a fourth. How is such a case to be decided, and what will be the effect of the decision in other countries than that in which it was pronounced? It is in the jurisprudence of

England and Scotland, as Story points out, that such questions have been most satisfactorily discussed. On the Continent the prevalence of the canon law, and the indifference of domestic tribunals to the opinion of foreign countries, have made these questions of less importance than they have been with us. England and Scotland stand to each other legally in the relation of foreign countries, while socially and politically they are one country. On the fundamental question whether marriage can be dissolved or not they took, until the passing of the English Divorce Act, different sides. When an English marriage was brought before the Scotch courts on a matrimonial complaint, they dissolved the marriage, while the English courts after such a dissolution held that the marriage still subsisted in full force and effect. The House of Lords, which was at once the highest court of appeal in Scotch and in English law, may almost be said to have decided the same question in two different ways,—holding that by the Scotch law the dissolution was good for Scotland, and not denying that by the English law it was bad for England. The two cases on which this opposition of views was most distinctly brought out were *Lolley's case* (1 Russell and Ryan) and *Warrender v. Warrender* (2 Clark and Finnelly). In the former case a man was convicted for bigamy for marrying again after having had his English marriage dissolved by the Scotch courts for his wife's adultery. The latter was an appeal to the House of Lords from the Court of Session asserting jurisdiction to decree divorce from an English marriage, and in the result it was held that the House of Lords in a Scotch case was bound to administer the law of Scotland, and that by the law of Scotland the jurisdiction was well founded. But the judgment in *Lolley's case* was not overruled; and although English marriages are no longer indissoluble, it may be presumed that the principle of that case would be applied when an English marriage had been dissolved in a foreign country for an offence not recognized as a valid ground of divorce in England. The following more recent cases may be noted as illustrating the attitude of English law towards foreign divorces. When the marriage took place in England, but the parties never lived together, and the husband committed adultery, and afterwards by arrangement went to Scotland for the purpose of founding a jurisdiction against himself, and the Scotch court pronounced a decree of divorce,—it was held that a Scotch marriage duly celebrated between the divorced wife and an Englishman did not give to the children of the marriage the character of lawfully begotten so as to enable them to succeed to property in England. So when A, an Englishwoman, married B in Scotland, and was again married to him in Belgium, and afterwards a Belgian court pronounced a decree of divorce by mutual consent, it was held that A's subsequent marriage to C in England was null and void, and that the Scotch marriage was still valid and subsisting. Again, a petitioner whose original domicile was English, and who married in England, resided two years and a half in one of the United States, and then obtained a divorce from a competent court there for grounds recognized in England, but without personal notice to the husband, who had never been within the State, and whose domicile continued to be English; it was held that her re-marriage in America during the lifetime of her husband was invalid in England. Had the petitioner been legally domiciled in the State which granted the divorce it appears that the English courts could have recognized the decree. In this class of questions may be placed those which have arisen as to the jurisdiction of the court. Here four points are mentioned in the English text-books as material, viz., allegiance, the place of marriage, the place of domicile, and the place of the delictum (see *DOMICILE*.) The court

has asserted its jurisdiction in the following cases:—when the allegiance and the place of marriage were English, the *locus delicti* and domicile foreign; when the allegiance and domicile were English, and the *locus contractus et delicti* foreign. It has been held that the court can inquire into the validity of a marriage in England between foreigners domiciled abroad at the time of the marriage. And when the marriage had been solemnized between foreigners in a foreign country, and the wife committed adultery abroad, the court held itself entitled to dissolve the marriage on the petition of the husband then domiciled in England. And in an Irish case it was held that the domicile of the husband will sustain the jurisdiction of the court over the wife though married abroad, always after marriage resident abroad, and accused of adultery committed abroad.

Questions of this sort have frequently arisen in American jurisprudence. The different States are to each other in the matter of divorce as foreign countries. The learned writer to whom we have already referred (Bishop, *Marriage and Divorce*) formulates the following propositions:—1. The tribunals of a country have no jurisdiction in divorce, wherever the offence may have occurred, if neither of the parties has an actual *bona fide* domicile within its territory; 2. It is sufficient for one of the parties to be domiciled in the country; both need not be, neither need the citation where the domiciled party is plaintiff be served personally on the defendant, if such personal service cannot be made; 3. The place where the offence was committed is immaterial; 4. The domicile of the parties at the time of the offence is immaterial; 5. It is immaterial under what system of divorce laws the marriage was celebrated. The author holds that the foregoing doctrines are not in conflict with the United States constitution, but that they are made binding by that constitution on the tribunals of all the States. It has been pointed out, however, that the fourth proposition has been denied by the courts of Pennsylvania and New Hampshire, which hold that only the courts of that country where the parties were domiciled when the offence was committed have jurisdiction to dissolve marriage for such offence. Bishop finally holds that “if a court has jurisdiction in a divorce cause, valid according to the law of the State in which it is taken, and not obnoxious to principles of inter-State comity, and it pronounces a divorce, it is binding on all the other States of the Union. If there was the domicile necessary to give the jurisdiction, and the defendant appeared to the suit, then the judgment would be everywhere in our country of absolute force, both as to the status of marriage and as to alimony and other like property rights. If the plaintiff only had a domicile, and there was no notice to the defendant within the jurisdiction, then the decree could affect only the plaintiff’s status of marriage.” (E. R.)

DIXMERIE, NICOLAS DE LA. See LA DIXMERIE.

DIXON, GEORGE (1755–1800?), an English navigator, born in 1755. He served under Captain Cook in his third expedition, during which he had an opportunity of learning the commercial capabilities of the north-west coast of America, and was thus prompted to the expedition in connection with which his own name is celebrated. After his return from Cook’s expedition he became a captain in the royal navy. In 1785 he offered his services to the King George’s Sound Company of London in making a minute exploration of the north-west coast of America. His offer having been accepted, he set sail in the autumn of that year in command of the “Queen Charlotte,”—a companion ship, the “King George,” being under the command of Captain Portlock. The voyage resulted in the discovery of numerous small islands, ports, and bays, of which Queen Charlotte’s Island, Port Mulgrave, Norfolk Bay, and Dixon’s Archipelago may be named as the most important.

From North America he sailed to China, where he disposed of his cargo. He returned to England in 1788. In the following year he published an account of his voyage, entitled *A Voyage round the World, but more particularly to the North-West Coast of America*, the bulk of which consists of descriptive letters by William Beresford, his supercargo. His own contribution to the work included valuable charts and appendices. In 1791 he published *The Navigator’s Assistant*. He died about 1800.

DIZFUL, or DESFUL, formerly known as *Anda-el-Mishk*, a town of Persia, in the province of Khuzistan, 36 miles north-west of Shuster, on the right bank of the Shat-el-Diz, or Abzal, a tributary of the Karnn, and there crossed by a fine bridge of twenty arches, the lower part of which is of ancient workmanship. It is the principal market of the province, and lies in a fertile district, productive of oranges, lemons, and indigo. The whole vicinity is full of the remains of ancient canals and buildings, which afford conclusive proof of former importance; and Mr Layard identified the spot with the castle of Lethe, or Oblivion, in which Shapur imprisoned the Armenian monarch Arsaces II. The popular identification of the ruins to the east with Jundi Shapur he regarded as a mistake. Population about 15,000.

DMITRIEFF, IVAN IVANOVITCH (1760–1837), a Russian statesman and poet, was born at his father’s estate in the government of Simbirk. In consequence of the revolt of Pugacheff, the family had to flee to St Petersburg, and there Ivan was entered at the school of the Semenoff Guards, and afterwards obtained a post in the military service. On the accession of Paul to the imperial throne he quitted the army with the title of colonel; and his appointment as procurator for the senate was soon after renounced for the position of privy councillor. During the four years from 1810 to 1814 he served as minister of justice under the emperor Alexander; but at the close of this period he retired into private life, and though he lived more than twenty years, he never again took office, but occupied himself with his literary labours and the collection of books and works of art. In the matter of language he sided with Karamsin, and did good service by his own pen against the Old Slavonic party. His poems include songs, odes, satires, tales, epistles, &c., as well as the fables—partly original and partly translated from Fontaine, Florian, and Arnault—on which his fame chiefly rests. Several of his lyrics have become thoroughly popular from the readiness with which they can be sung; and a short dramatico-epic poem on Yermak, the Cossack conqueror of Siberia, is well known. His writings occupy three volumes in the first five editions; in the 6th (St Petersburg, 1823) there are only two. His memoirs, to which he devoted the last years of his life, were published at Moscow in 1866.

DMITROFF, a town of Russia, in the government of Moscow, 45 miles due north of the city of that name, in 56° 21′ N. lat. and 37° 31′ E. long., near the river Yakhroma, a sub-tributary of the Volga. Besides the Cathedral of the Assumption and Paraskeue, an ancient building originally erected as a nunnery, it possesses seven churches, a monastery, a hospital, an almshouse, and factories for the manufacture of silk, wool, and cotton. The inhabitants also cultivate market-gardens for Moscow, and carry on a moderate trade in grain. The existence of Dmitroff is due to the grand-duke George Vladimirovitch, who happening, during his exile from Kieff, to receive on the spot the news of the birth of his son Demetrius, celebrated the event by founding the city and assigning it as an apanage for his child. Demetrius continued in possession till he was himself called to the grand-ducal dignity in 1177. In 1304 the town was the seat of a

ducal diet; in 1656 it was visited by a terrible pestilence, and in the Polish-Lithuanian invasion it witnessed the defeat of Sapieha by Prince Ivan Karakin. Population in 1873, 8042.

DMITROVSK, a town of European Russia, in the government of Orel, near the Nerusa, a sub-tributary of the Dnieper, about 57 miles south-west of the town of Orel, in 52° 30' N. lat. and 35° 4' 9" E. long. It consists of about 700 wooden houses, has four churches and a hospital, manufactures soap, and deals in grain, hemp, linseed oil, and tallow. Dmitrovsk was founded by Demetrius Cantemir, the hospodar of Moldavia, who in 1711 received from Peter I. the district in which it stands in compensation for the loss he had sustained in Moldavia; and its first inhabitants consisted of Malo Russian and Wallachian immigrants. Population, 7600.

DNIEPER, the Borysthenes of the Greeks, Danapris of the Romans, Uzi of the Turks, Eksi of the Tatars, Elice of Visconti's map (1381), Lerene of Contarini (1437), and Luosen of Baptista of Genoa (1514), is one of the most important rivers of Europe, ranking after the Volga and the Danube. It belongs to Russia, and takes its rise in the government of Smolensk, in a swampy district at the foot of the Valdai Hills, not far from the sources of the Volga and the Dwina, in 55° 52' N. lat. and 33° 41' E. long. Its length is about 11,000 miles, and it drains an area of 242,000 square miles, which supports a population of upwards of twelve million inhabitants. In the first part of its course, which may be said to end at Dorogobush, it flows through an undulating country of Carboniferous formation, in the second it passes west to Orsha, south through the great fertile plain of Kisheneff and Chernigoff, and then south-east across the rocky steppe of the Ukraine to Ekaterinoslaff. About 45 miles south of this town it has to force its way across the same granitic offshoot of the Carpathian Mountains which interrupts the course of the Dniester and the Bug, and for a distance of about 40 miles rapid succeeds rapid. The whole fall of the river in that space is 155 feet,—the greatest of the ten distinctly marked rapids, that at Nenasitetz, having an average of 3 inches in every 50 feet, and the smallest, or the *Leshni Porog*, about 1½ths of an inch in the same distance. The river having got clear of the rocks continues south-west through the grassy plains of Kherson and Tanris, and enters the Black Sea by means of a considerable estuary in 46° 21' N. lat. and 32° 20' E. long. The navigation of the Dnieper extends as far up as Dorogobush, where the depth is about 12 feet, and rafts are floated down from the higher reaches. About the town of Smolensk the breadth is 455 feet, at the confluence of the Pripet 1400, and in some parts of the Ekaterinoslaff district as much as 7000. In the course above the rapids the channel varies very greatly in nature and depth, and it is not unfrequently interrupted by shallows, no fewer than 55 being counted in the Kieff government alone. The rapids, or *porogs*, form a serious obstacle to navigation; it is only for a few weeks, when the river is in flood, that they are passable, and even then the venture is not without risk, and can only be undertaken with the assistance of the special pilots, who to the number of 2000 or 3000 have established themselves at Lotmanskaya-Kamenka and other places in the neighbourhood. As early as 1732 an attempt was made to improve the channel, and extensive operations have since been carried on from time to time. A canal, which ultimately proved too small for use, was constructed at Nenasitetz in 1780 at private expense, blastings were employed in 1798 and 1799 at various parts by Generals Besh and Devolan, in 1805 a canal was formed at Kandatzki, and the channel rectified at Sursk; by 1807 a new canal was completed at Nenasitetz; in 1833 a passage was cleared through the

Starokaindatzki Porog; and in the period from 1843 to 1853 a whole series of ameliorations were effected. The result has been not only greatly to diminish the dangers of the natural channel, but also to furnish a series of artificial canals by which vessels can make their way when the water is too low in the river. Between 1852 and 1857, 277 vessels and 674 rafts passed the rapids annually; and only 4 of these vessels came to grief. Within recent years the water in the river has been unusually low, but it is expected that the draining of the Pinsk marshes may remedy the evil. Of the tributaries of the Dnieper the following are navigable,—the Berezhina and the Pripet from the right, and the Merea and Sozh and the Borona and Desna from the left. In the upper parts of the river the fisheries are not of sufficient importance to constitute a separate occupation; but in the estuary they attract a large concourse of people from the neighbouring governments, and form almost the sole means of subsistence for the Swedish colonists. At Kieff the river is free from ice on an average 267 days in the year, at Ekaterinoslaff 274, and at Kherson from 280 to 285.

DNIESTER, the Tyras of the classical authors, and the Turla of the Turks, a river of south-eastern Europe belonging to the basin of the Black Sea. It takes its rise on the northern slope of the Carpathian Mountains in the Sambor circle of Galicia, and belongs for the first 330 miles of its course to Austrian, for the remaining 600 to Russian territory. In its excessive meandering it frequently almost returns to the same spot; for example, while the actual distance from Turunchuk to Mayakoff is about 33 miles, the development of the river would require about 133. At the same time, as the average fall is from 25 to 26 inches in the mile, the current in most parts even during low water is pretty rapid, the mean rate per hour being calculated at 8638 feet. The average width of the channel is from 560 to 700 feet, but in some places it attains as much as 1400 feet; the depth is various and changeable. The banks are usually about 3500 feet apart, but in certain reaches approach each other so as to leave room for nothing but the actual bed; their average height above the water in the Bessarabian portion is 350 feet. The principal interruption in the navigable portion of the river, besides the somewhat extensive shallows, is occasioned by a granitic spur from the Carpathians, and bears the name of the Yampolskie Porogi, or Yampol Rapids. For ordinary river-craft the passage of these rapids is rendered possible, but not free from danger, by a natural channel on the left side, and a larger and deeper artificial channel on the right; for steam-boats they form an insuperable barrier. The river falls into the sea by several shallow arms, of which the most important has a depth of only 2½ feet near its mouth, but the Turunchuk, an independent stream, disengaging in the neighbourhood, has a depth of 7 or 8 feet, and is connected with the main channel of the Dniester by the Surovtzoff canal, so named after the merchant at whose expense it was constructed. There are two periodical floods in the river,—the first and greatest caused by the breaking up of the ice, and occurring in the latter part of February or in March, and the second, due to the melting of the snows of the Carpathians, and consequently taking place about June. The spring flood raises the level of the water 20 feet, and pours along so violent a current that large blocks of stone are drifted from their position, towards the mouth of the river gardens and vineyards are submerged, and the surface of the stream measures from four to six miles across. In some years the general state of the water is so low that navigation is possible only for three or four weeks, while in other years it is so high that navigation continues without interruption. Steam-boat traffic was introduced in the lower reaches in 1840, when

the government vessel "Prince Vorontzoff" began to make regular trips between Ovidiopol and Akerman; and since that date it has acquired very considerable dimensions. The fisheries of the estuary are of some importance; and the lakes which are formed by the inundations of the valley furnish a valuable addition to the diet of the people in the shape of carp, pike, and tench. The principal towns on the river are Sambor, Khotin, Mohileff, Dubossari, Grigoriopol, Bender, Tiraspol, and Akerman; its tributaries are numerous, but not of individual importance.

DOAB, or DUAB, or DOOAB, a name, like the Greek Mesopotamia, applicable, according to its derivation (*do*, two, and *ab*, river), to the stretch of country lying between any two rivers, as the Barce Doab between the Sutlej and the Ravee, or the Reechna Doab between the Ravee and the Chenab, but frequently employed, without any distinctive adjunct, as the proper name for the region between the Ganges and its great tributary the Jumna. In like manner the designation of Doab Canal is given to the artificial channel which breaks off from the Jumna near Fyzabad, and flows almost parallel with the river till it reunites with it at Delhi.

DOBELL, SYDNEY (1824–1874), a distinguished English poet, born on the 5th of April 1824 at Cranbrook, Kent, was sprung from an old Sussex family, noted for its staunch loyalty in the struggle between the Cavaliers and Roundheads. His father, John Dobell, who wrote a pamphlet on *Government*, was a wine merchant at Cheltenham; his mother was a daughter of Samuel Thompson, a famous political reformer. When Dobell was twelve years old, the family went to Gloucestershire; and the poet, ever after, with occasional breaks, kept up his connection with the district. He was educated privately, and never attended either school or university. He refers to this in some precocious lines, in imitation of Chaucer, dating from his eighteenth year. In 1844 he married Emily Fordham, a lady of an old county family in Cambridgeshire. Cheltenham was, for the most part, his home in those early years, as his father's business had to be carried on; but the summer was often spent in the country. During this period his poetic vein flowed freely. He wrote a number of minor poems instinct with a passionate desire for political reform. *The Roman* was also in progress, and was written mainly among the Cotswolds. It appeared in 1850, under the *nom de plume* of Sydney Yendys. Next year he travelled through Switzerland with his wife; and, after his return, he formed friendships with Robert Browning, Philip Bailey, George Macdonald, Emanuel Deutsch, Lord Houghton, Ruskin, Holman Hunt, Mazzini, Tennyson, and Carlyle, and conducted an interesting correspondence with Charlotte Brontë. His second large poem, *Balder*, written partly at Coxhorne, partly among the Alps, and finished at Amberley Hall, appeared in 1854. The three following years were spent in Scotland—the winters in Edinburgh, the summers in the Highlands. Here he endeared himself to an entirely new circle, including Dr John Brown, Dr Hanna, Hugh Miller, Sir Noel Paton, Sir James Y. Simpson, and Professor and Mrs Blackie. Perhaps his dearest friend at this time was Alexander Smith, in company with whom he published, in 1855, a number of sonnets on the Crimean War, which were followed by a volume on *England in Time of War*. The delivery of an elaborate lecture on the "Nature of Poetry" to the Edinburgh Philosophical Institution, in April 1857, seriously injured Dobell's chest. Accordingly he spent the winters of the four following years in the Isle of Wight; and, after 1862, the winter generally found him on the Continent, the summer in Gloucestershire. On one occasion, while near Naples, he fell through a thin crust of earth into some underground works, to a depth of about

12 feet. This accident proved injurious to his health; and, in 1869, a mare, which he was trying to break, fell and rolled over with him. After this he was, more or less, an invalid, and lived in Gloucestershire, preserving his admiration for natural beauty, his keen interest in public affairs, his sunny sweetness of temper, and deep religious feeling, till his death in 1874.

As a poet Dobell belongs to the "spasmodic school," as it was happily named by Professor Aytoun, who parodied its style in *Firmilian*. The epithet, however, was first applied by Carlyle to Byron. The school includes the Rev. George Gilfillan, Philip James Bailey, Stanyan Bigg, Dobell, Alexander Smith, and, according to some critics, Gerald Massey. It is characterized by an under-current of discontent with the mystery of existence, by vain effort, unrewarded struggle, sceptical unrest, and an uneasy straining after some incomprehensible end. It thus faithfully reflects a prevalent phase of 19th century thought, and consequently is a perfectly legitimate exercise of the muse. Poetry of this kind is marked by an excess of metaphor, which darkens rather than illustrates, and a general extravagance of language. On the other hand, it manifests a freshness and originality, and a rich natural beauty, not often found in more conventional writings. In this school Dobell shares with Bailey the foremost place, and his genius received early recognition from the Rev. George Gilfillan. He is possessed by his ideal of what a poet ought to be. An intensely earnest spirit pervades all his works; and, like Milton and Wordsworth, he has no humour. We sometimes meet, in his writings, conceits and obscurities which remind us of Cowley and Donne; and still oftener his intellectual subtlety, gorgeous imagery, and exquisite lyrics recall Shelley. *The Roman*, a poem dedicated to the interests of political liberty in Italy, is marked by pathos, energy, and passionate love of freedom; and its clear vivid style enchains the reader throughout. His treatment of the Colosseum has been compared, not unfavourably, with Byron's. The faults of the work arise almost entirely from the author's embarrassment in dealing with his own riches. The drama, too, is overlaid with monologue, which is carried to such a dreary excess in *Balder*—a poem so intensely subjective as to fail utterly in human interest. The gloomy egotism of the moody hero wearies most readers, but is relieved, from time to time, by some of the finest descriptions of nature in English poetry, by Amy's exquisitely touching songs, and by grander passages than any to be found in *The Roman*. There is a distinct falling off, however, in purity of style. The purpose of *Balder* has been strangely misunderstood by many critics; and some have actually identified the hero with the author. The object of the book is to show the evil moral effects of egotism and a lust for power on a man of genius. The passage on Chamonni is unsurpassed even by Coleridge. *Balder*, still more than his other poems, manifests Dobell's wealth of thought, as well as the prodigal richness of his imagery.

England in Time of War is the most pleasing of Dobell's works, and allows his lyrical impulse full scope. The book is steeped in passion, and gives faithful and poetical, because thoroughly simple, expression to the feelings of many English hearts at the time. In all Dobell's poems a great fondness for alliteration is observable.

His chief prose writings have been collected and edited with an introductory note by Professor Nichol (*Thoughts on Art, Philosophy, and Religion*. London: Smith, Elder, and Co., 1876). The lecture on the "Nature of Poetry" is an elaborate disquisition, in which a perfect poem is defined as "the perfect expression of a perfect human mind." In his pamphlet on *Reform*, he maintains "that a just national representation is such as represents the nation at its efficient durable best." In his memoranda for

a projected play, the character of the cardinal is finely conceived. He is to have "no element *not* common to all men and no element *as* common to all men,—a life such as every man *might* lead but no man *does* lead,—in which the things done are *not* those which men do rarely, but the common acts of men done in a rare spirit." Dobell's prose writings are studded with such suggestive sentences as we have quoted. The singular truth of his observations of nature is well seen in his description of the "Symptoms of the Dissolution of Night" (*Thoughts*, p. 83). His prose style lacks simplicity, both in the individual words used and in the structure of the sentences. The classical element is much too prominent in his vocabulary. In his religious views, Dobell was a Christian of the Broad Church type. Socially he was one of the most amiable and true-hearted of men. He will long be remembered as an admirable song-writer, a suggestive and original thinker, and an ardent lover of political liberty. The standard edition of his poems is edited by Professor Nichol of Glasgow University, who has prefixed to the work a beautifully written life. (T. G.)

DÖBELN, a town of Saxony, in the circle of Leipsic, and 35 miles to the south east of that town, standing partly on an island formed by the Mulde. It is the centre of a considerable corn trade. The manufactures are cloth, cordwain and other leather, shoes, hats, belts, lacquered tin ware, agricultural and weighing machines, and cigars. Population, 10,969 in 1875.

DOBERAN, or DOBERAN, a market town of Northern Germany, in the grand duchy of Mecklenburg-Schwerin, about two miles from the shores of the Baltic, and seven west of Rostock. Besides the ruins of a Cistercian abbey founded by Pribislaw II. in 1173, and secularized in 1552, it possesses a church of the 14th century, which ranks as one of the finest in Northern Germany, a grand ducal palace, a theatre, an exchange, and a concert-room. In 1793 Duke Frederick Francis caused the first seaside watering-place in Germany to be established on the neighbouring coast, at the spot where the Heiliger Damm, a great bank of rocks about 1000 feet broad and 15 feet high, stretches out into the sea and forms an excellent bathing ground. Though no longer so popular as in the early part of the century, it is still frequented. In the immediate neighbourhood of the town three mineral springs were discovered in 1829—one sulphurous, a second saline, and the third chalybeate. Population in 1875, 3866.

DOBRENTI, GABOR (i.e., GABRIEL) (1786–1851), an Hungarian philologist and antiquary, was born at Nagyszollos in 1786. He completed his studies at the universities of Wittenberg and Leipsic, and was afterwards engaged as a tutor in Transylvania. At this period he originated and edited the *Erdelyi Múzeum*, which, notwithstanding its important influence on the development of the Magyar language and literature, soon failed for want of support. In 1820 Döbrentei settled at Pesth, and there he spent the rest of his life. He held various official posts, but continued zealously to pursue the studies for which he had early shown a strong preference. His great work is the *Ancient Monuments of the Magyar Language* (*Régi Magyar Nyelvmélekek*), the editing of which was intrusted to him by the Hungarian Academy. The first volume was published in 1838 and the fifth was in course of preparation at the time of his death. Döbrentei was one of the twenty-two scholars appointed in 1825 to plan and organize, under the presidency of Count Teleki, the Hungarian Academy. In addition to his great work he wrote many valuable papers on historical and philological subjects, and many biographical notices of eminent Hungarians. These appeared in the Hungarian translation of Brockhaus's *Conversations-Lexikon*. He translated into

Hungarian *Macbeth* and other plays of Shakespeare, several of Schiller's tragedies, and Molière's *Avare*, and wrote several original poems. His article on "Magyar Literature" in the *Conversations-Lexikon* was translated into English. Döbrentei does not appear to have taken any part in the revolutionary movement of 1848. He died at his country house, near Pesth, March 28, 1851.

DOBRIZHOFFER, MARTIN (1717–1791), a Roman Catholic missionary, whose fame is preserved by the historical interest and the literary character of his narrative. Born at Gratz, in Styria, he joined the Society of Jesus in 1736, and in 1749 proceeded to Paraguay, where for eighteen years, first among the Guaranis, and latterly among the Abipones, he continued with steadfast devotion and easy cheerfulness to discharge the difficult and hazardous duties of his profession. Returning to Europe on the expulsion of the Jesuits from South America, he settled at Vienna, obtained the patronage, or rather the friendship, of Maria Theresa, survived the extinction of his order, composed the history of his mission, and died on July 17, 1791. His history appeared at Vienna in 1784, in the author's own Latin, and in a German translation by Professor Kral of the university of Pesth. Of the contents of the work some idea may be obtained from its extended title—*Historia de Abiponibus, Equestri Bellicosaque Paraguarie Natione, locupletata Copiosis Barbararum Gentium Urbium, Fluminum, Ferarum, Amphibiorum, Insectorum, Serpentium præcipuorum, Piscium, Arum, Arborum, Plantarum aliarumque ejusdem Provincia Proprietatum Observationibus*. The "lively singularity" and garrulous quaintness of the style could only be displayed by lengthened quotation. In 1822 there appeared in London an anonymous (not altogether complete) translation, which has not unfrequently been ascribed to Southey, but was really the work of Sara Coleridge, who, while still in her teens, had undertaken the task to defray the college expenses of one of her brothers. To the youthful translator a delicate compliment was paid by Southey in the third canto of his *Tale of Paraguay*, the story of which was derived from the pages of Dobrizhoffer's narrative:—

"And if he could in Merlin's glass have seen
By whom his tomes to speak our tongue were taught,
The old man would have felt as pleased, I ween,
As when he won the ear of that great Empress Queen."

DOBROWSKY, JOSEPH (1753–1829), one of the earliest and greatest of Slavonic philologists, was born of Bohemian parentage at Gjermet, near Raab, in Hungary. He received his first education in the German school at Bischofteinitz, made his first acquaintance with Bohemian at the Deutschbrod gymnasium, studied for some time under the Jesuits at Klattau, and then proceeded to the university of Prague. In 1772 he was admitted among the Jesuits at Brünn; but on the dissolution of the order in 1773 he returned to Prague to study theology. After holding for some time the office of tutor in the family of Count Nostitz, he obtained an appointment first as vice-rector, and then as rector, in the general seminary at Hradisch; but in 1790 he lost his post through the abolition of the seminaries throughout Austria, and returned as a guest to the house of the count. In 1792 he was commissioned by the Bohemian Academy of Sciences to visit Stockholm, Abo, Petersburg, and Moscow in search of the manuscripts which had been scattered by the Thirty Years' War, and on his return he accompanied Count Nostitz to Switzerland and Italy. His reason began to give way in 1795, and in 1801 he had to be confined in a lunatic asylum; but by 1803 he had completely recovered. The rest of his life was mainly spent either in Prague or at the country-seats of his friends Counts Nostitz and Czernin; but his death took place at Brunn, whither he had gone in

1828 to make investigations in the library. While his fame rests chiefly on his philological labours, his botanical studies are not without value in the history of the science. The following is a list of his more important works ; and it will be observed that, dealing, as they do, with Slavonic subjects, they are all composed in Latin or German :—

Fragmentum Pragense evangelii S. Marci, vulgo autographi, 1778, a periodical for Bohemian and Moravian literature, 1780–1787 ; *Scriptores Rerum Bohemicarum*, 2 vols. 1783 ; *Geschichte der böhm. Sprache und altern Literatur*, 1792 ; *Die Bildsamkeit der slaw. Sprache*, 1799, a *Deutsch böhm. Wörterbuch* compiled in collaboration with Lešek, Puchmayer, and Hanka, 1802–1821 ; *Entwurf eines Pflanzensystems nach Zahlen und Verhältnissen*, 1802 ; *Grammática*, 1807 ; *Lehrgründe der böhm. Sprache*, 1809 ; *Institutiones lingue slavae dialecti veteris*, 1822 ; *Entwurf zu einem allgemeinen Etymologikon der slaw. Sprachen*, 1813 ; *Slavanka zur Kenntnis der slaw. Literatur*, 1814, and a critical edition of Jordan's, *De Rebus Getis*, for Pert's *Monumenta Germaniae historica*. See Palacky, *J. Palacky's Leben und gelehrtes Wirken*, 1833.

DOBRUDJA, or DOBRUDSCHA, in Bulgarian Dobritch, is the district lying between the Black Sea and the lower reaches of the Danube, by which it is separated from Roumania. The southern part of its area of 2900 square miles is occupied by an irregular steppe stretching north from the Balkan range ; while the northern belongs to the alluvial tract produced by the action of the river. The predominant element in its heterogeneous population, which is estimated at 160,000, consists of the Tatars, whose numbers have been greatly augmented by immigration since 1859 ; but there are also Turks, Bulgarians, Roumanians, Greeks, Armenians, Germans, and Jews, and all the various nationalities remain strikingly distinct, and usually occupy more or less exclusively their separate settlements. The principal places in the Dobrudja are Rassoia, Hir-ova, Matchin, Iskehr, and Tulcha on the Danube ; Babadagh towards the north, which was formerly regarded as the chief town of the district ; Kustendji, Mangalia, and Balchik on the coast ; Eski-djik towards the south and some distance inland ; and, finally, the new Tatar city of Meljidia, which has sprung up since 1860 on the railway between Tchernavoda and Kustendji. The strategical importance of the Dobrudja was recognized by the Romans, who in the reign of Trajan built a line of fortifications from the river near Rassoia to the coast near Kustendji ; and in modern times it has been more than once utilized, especially during the Russian invasions of 1828, 1854, and 1877. See Peters, *Grundrissen zur Geographie und Geologie der Dobrudscha*, Vienna, 1867–1868.

DOBSCHAU, or DOBSINA, a town of Northern Hungary, in the comitat of Gömör, on the Dobsina. In the vicinity are mines of iron, copper, cobalt, and mercury. Population, 5505 in 1869.

DOBSON, WILLIAM (1610–1646), an English portrait and historical painter, born at London in 1610. His father was master of the Alienation Office, but by his improvidence had fallen into reduced circumstances. The son was accordingly bound an apprentice to Peak, a stationer and picture dealer in Holborn Bridge ; and while in his employment he began to copy the pictures of Titian and Vandyck, whose manner he ever after retained. He also took portraits from life under the advice and instruction of Francis Cleyu, a German artist of considerable repute. Vandyck, happening to pass a shop in Snow Hill where one of Dobson's pictures was exposed, sought out the artist, and presented him to Charles I., who took Dobson under his protection, and not only sat to him several times for his own portrait, but caused the prince of Wales, Prince Rupert, and many others, to do the same. The king had a high opinion of his artistic ability, styled him the English Titoret, and appointed him sergeant-painter on the death of Vandyck. After the fall of Charles, Dobson was reduced to great poverty, and fell into dissolute habits.

He died at the early age of thirty-six. Excellent examples of Dobson's portraits are to be seen at Blenheim, Chatsworth, and several other country seats throughout England. The head in the Decollation of St John the Baptist at Wilton is said to be a portrait of Prince Rupert.

DOCTÆ (from δόκειν, to appear), a name applied to those heretics in the early Christian church who held that Christ, during his life, had not a real or natural, but only an apparent or phantom body. Other explanations of the δόκησις, or appearance, have, however, been suggested, and in the absence of any statement by those who first used the word of the grounds on which they did so, it is impossible to determine between them with certainty. The name Docetæ is used by Clement of Alexandria as the designation of a distinct sect, of which he says that Julius Cassianus was the founder. Docetism, however, undoubtedly existed before the time of Cassianus. The origin of the heresy is to be sought in the Greek, Alexandrine, and Oriental philosophizing about the imperfection or rather the essential impurity of matter. Traces of a Jewish Docetism are to be found in Philo ; and in the Christian form it is generally supposed to be combated in the writings of John, and more formally in the epistles of Ignatius. It differed much in its complexion according to the points of view adopted by the different authors. Among the Gnostics and Manichæans it existed in its most developed type, and in a milder form it is to be found even in the writings of the orthodox teachers. The more thoroughgoing Docetæ assumed the position that Christ was born without any participation of matter ; and that all the acts and sufferings of his human life, including the crucifixion, were only apparent. They denied, accordingly, the resurrection and the ascent into heaven. To this class belonged Dosithens, Saturninus, Cerdo, Marcion, and their followers, the Ophites, Manichæans, and others. The other, or milder school of Docetæ, attributed to Christ an ethereal and heavenly instead of a truly human body. Amongst these were Valentinus, Bardesanes, Basilides Tatianus, and their followers. They varied considerably in their estimation of the share which this body had in the real actions and sufferings of Christ. Clement and Origen, at the head of the Alexandrian school, took a somewhat subtle view of the incarnation, and Docetism pervades their controversies with the Monophysites. Docetic tendencies have also been developed in later periods of the church's history, as for example by the Priscillianists and the Bogomiles, and also since the Reformation by Jacob Boehme, Menno Simons, and a small fraction of the Anabaptists. Docetism springs from the same roots as Gnosticism, and the Gnostics generally held Docetic views. Accordingly, for a fuller account of the principles out of which Docetism arose, and of the various modifications it assumed, the reader is referred to the article GNOSTICISM. See also the articles on the leading Docetæ mentioned above.

DOCK, the name applied to the plants constituting the section *Lapathum* of the genus *Rumex*, and natural order *Polygonaceæ*. The leaves of the docks are pinnate-veined, and are never sagittate or hastate ; the flowers, which are arranged in two to five rows, in alternate fascicles similar to whorls, are generally perfect, and have three free styles, multifid stigmas, six stamens, and the three inner perianth-segments or petals in some cases tubercled, the fruit is an achene (see vol. iv. p. 150). In the Common or Broad-leaved Dock, *Rumex obtusifolius*, the flower-stem is erect, branching, and 18 inches to 3 feet high, with large radical leaves, heart-shaped at the base, and more or less blunt, the other leaves are more pointed, and have shorter stalks. The whorls are many-flowered, close to the stem, and mostly leafless. The root is many-headed, black externally, and yellow within. The flowers appear from June to

August. In autumn the whole plant may become of a bright red colour. It is a troublesome weed, common by roadsides and in fields, pastures, and waste places throughout Europe. An infusion of its root has been used as a remedy for ichthyosis; in large quantities it acts as a purgative. The powdered root is sometimes employed as a dentifrice. The Great Water Dock, *R. Hydrolapathum*, believed to be the *herba britannica* of Pliny (*Nat. Hist.*, xxv. 6), is a tall-growing species; its root is used as an antiscorbutic. The root of the Curled Dock, *R. crispus*, affords an ointment and decoction reputed to be cures for scabies; and the seeds of the same species have been found efficacious in dysentery. Other British species are the Sharp Dock, *R. conglomerata*, the root of which has been employed in dyeing; the Bloody-veined Dock, or Bloodwort, *R. sanguineus*; the Yellow Marsh Dock, *R. palustris*; the Fiddle Dock, *R. pulcher*; the Golden Dock, *R. maritimus*; the Grainless Curled Dock, *R. domesticus* (= *aquaticus*); and the Meadow Dock, *R. pratensis*. The naturalized species, *R. alpinus*, or "Monk's Rhubarb," was early cultivated in Great Britain, and was accounted an excellent remedy for ague.

DOCK. See HARBOURS.

DOCKYARDS Previously to the reign of Henry VIII, the kings of England had neither naval arsenals nor dockyards, nor any regular establishment of civil or naval officers to provide ships of war, or to man them; they had admirals, however, possessing a high jurisdiction and very great power (see the article ADMIRAL). There are strong evidences of the existence of dockyards, or of something answering thereto, at very early dates, at Rye, Shoreham, and Winchelsea. In November 1243 the sheriff of Sussex was ordered to enlarge the house at Rye in which the king's galleys were kept, so that it might contain seven galleys. In 1238 the keepers of some of the king's galleys were directed to cause those vessels to be breamed, and a house to be built at Winchelsea for their safe custody. In 1254 the bailiffs of Winchelsea and Rye were ordered to repair the buildings in which the king's galleys were kept at Rye. At Portsmouth and at Southampton there seem to have been at all times depôts both for ships and stores, though there was no regular dockyard at Portsmouth till the reign of Henry VIII. It would appear, from a very curious poem in Hakluyt's *Collection*, called *The Police of Keeping the Sea*, that Henry V. had ships, officers, and men exclusively appropriated to his service, and independently of those which the Cinque Ports were bound, and the other ports were occasionally called upon, to furnish on any emergency. By this poem it also appears that Little Hampton, unfit as it now is, was the port at which Henry built

his great *Dromions*

Which passed other great shippes of the commons.

The "dromion," "dromon," or "dromedary," was a large war ship, the prototype of which was furnished by the Saracens. Roger de Hoveden, Richard of Devizes, and Peter de Longtoft celebrate the struggle which Richard I., in the "Trench the Mer," on his way to Palestine, had with a huge dromon,— "a marvellous ship | a ship than which, except Noah's ship, none greater was ever read of." This vessel had three masts, was very high out of the water, and is said to have had 1500 men on board. It required the united force of the king's galleys, and an obstinate fight, to capture the dromon.

The foundation of a regular navy, by the establishment of dockyards, and the formation of a board, consisting of certain commissioners for the management of its affairs, was first laid by Henry VIII.; and the first dockyard erected during his reign was that of Woolwich. Those of Portsmouth, Deptford, Chatham, and Sheerness followed

in succession. Plymouth was founded by William III. Pembroke was established in 1814, a small yard having previously existed at Milford.

From the first establishment of the dockyards to the present time, most of them have gradually been enlarged and improved by a succession of expedients and makeshifts, which answered the purposes of the moment; but the best of them have not possessed those conveniences and advantages which might be obtained from a dockyard systematically laid out on a uniform and consistent plan, with its wharfs, basins, docks, ships, magazines, and workshops arranged according to certain fixed principles, calculated to produce convenience, economy, and despatch.

Neither at the time when our dockyards were first established, nor at any subsequent periods of their enlargement, could it have been foreseen what incalculable advantages would one day be derived from the substitution of machinery for human labour; and without a reference to this vast improvement in all mechanical operations, it could not be expected that any provision would be made for its future introduction; on the contrary, the docks and slips, the workshops and storehouses, were successively built at random, and placed wherever a vacant space would most conveniently admit them, and in such a manner as in most cases to render the subsequent introduction of machinery and railways, and those various contrivances found in large private manufacturing establishments, quite impossible, even in the most commodious of Her Majesty's dockyards.

From a brief description of the royal dockyards as they now stand a general idea may be formed of their several capacities, advantages, and defects. Taking them in succession, according to their vicinity to the capital, the first is

DEPTFORD.—Deptford dockyard was first established about the year 1513, and continued to be a building yard, as well as a large depôt for naval stores, until 1869, when it was closed as a building yard in pursuance of a recommendation of a committee of the House of Commons, which reported in 1864. The increasing size of ships of war rendered the yard unsuitable for any but the smaller types of vessels, while the continuous deposits of river mud, not only along the frontage but also in the docks and basins, rendered it a costly and decreasingly valuable place of construction. It had an interesting history. Not only were some of the most celebrated ships of the navy built there, but during the Great Plague the office of the Admiralty was removed thither from Seething Lane. Peter the Great worked in the yard as a shipwright, dwelling the while at Sayes Court, the residence of Evelyn, the author of *Sylva* and of the diary not less famous than Pepys's. Evelyn was the grantee of some of the ground on which the dockyard stood, for no other consideration than that there should always be a keel laid down in the yard. Queen Elizabeth's Admiralty officials were at one time resident at Deptford; and thither went the queen in 1580 to confer the honour of knighthood on Sir Francis Drake, and to dine with him on board the ship in which he had circumnavigated the world.

Though closed as a building yard in 1869, in accordance with the recommendation of a committee of the House of Commons, part of the establishment, with suitable storehouses, was retained as a depôt for naval stores, and as the one place from which shipments of stores to naval depôts abroad should be made. Of the residue, part was sold to Mr Evelyn, who made the purchased part into a recreation ground for the Deptford people, and gave it to them. The rest was sold for a metropolitan meat market to the Corporation of London. When intact the front or wharf wall of this dockyard, facing the Thames, was about 1700 feet in length, and the mean breadth of the yard 650 feet; the superficial content about 30 acres. It had three slips

for ships of the line on the face next the river; and two for smaller vessels, which launched into a basin or wet dock, 260 by 220 feet. There were also three dry docks,—one of them a double dock, communicating with the Thames, and the other a smaller one, opening into the basin. The number of men employed in this yard, in time of war, was about 1500, of whom one-half were shipwrights and artificers, and the other half labourers. There were, besides, 18 or 20 teams of 4 horses each, to drag timber and heavy stores.

The proximity of Deptford yard to the capital is of great importance, in the convenience it affords for receiving from this great mart all the home manufactures and products which may be purchased for the use of the navy. It is the general magazine of stores and necessities for the fleet, whence they are shipped off, as occasion requires, to the home yards, the outports, and the foreign stations, in store-ships, transports, coasting sloops, lighters, and lannches, according to the distance they have to be sent.

The management of Deptford naval store yard is now merged in that of the victualling yard, a most complete establishment of its kind. Till 1869 this management comprised a naval captain superintendent, with a master in the navy as his assistant. Under them a storekeeper, a store receiver, an accountant, an inspector of stores, and their respective staffs, conducted the administrative duties of the place. In 1869 the Board of Admiralty, in accordance with the recommendations of a departmental committee, abolished the offices of captain superintendent and master attendant, and placed the establishment under the civilian management of the storekeeper. The naval superintendents were appointed for five years, and after that time were withdrawn to make way for others. The superintending storekeeper is appointed as a permanent officer, and under him experience is accumulated and applied in all the manufactories and other business departments of the yard. The manufactures conducted by and for the Government at Deptford comprise biscuit making on such a scale as to supply, with the yield of the victualling yards at Gosport and Plymouth, biscuit enough for the whole navy, and also chocolate making, mustard making, flour grinding, and the operations of a large coöperage. Most of the salt beef required for the navy is salted and put up there. Deptford may be called the heart of the victualling service. From its stores are shipped the whole of the consignments required for replenishment of depôts abroad, as well as the requirements of the other two victualling yards in England, except that at the last-named the supplies of biscuits and flour are provided on the spot. The number of men employed at Deptford necessarily varies. During war upwards of a thousand men are required. The space occupied by the victualling yard is about 19 acres. There is a river frontage of 1700 feet, and a mean depth of 1000 feet.

In 1877 there are employed in the naval store and victualling yard at Deptford 258 men on the establishment, and 390 men on the hired list, at a cost of £25,847.

WOOLWICH DOCKYARD.—This no longer exists as a naval station. Though retaining its name, it remains as a depôt in the hands of the War Department, for whose work its river frontage of 3680 feet, and its docks and basins, afford excellent accommodation. Woolwich was the first and most ancient of all the dockyards, having been established in the reign of Henry VII. From it have been launched some of the finest and most celebrated ships of the English navy. In 1512 the "Harry Grace de Dieu" was built, and in 1552 was accidentally burnt, there. In more modern times the "Nelson" and the "Ocean" were from Woolwich, and those latest specimens of the now extinct class of fighting ship, the "Trafalgar," "Agamemnon," and "Royal Albert." As an establishment for the building

and repair of ships, especially steam ships, Woolwich was perhaps the completest and best furnished of all the dockyards. Its power to make and repair engines and all iron work, whether of ship or fittings, was so extensive as to enable the Government, before the introduction of iron-clads, to be nearly independent of the private trade. With occupation for 1800 workmen, it was able to rely upon its own resources almost exclusively. Its proximity to London gave it other great advantages, including this, that the Admiralty were thereby enabled the more easily to supervise the constructive work for which its architects were responsible. But for the fatal operation of two causes, the increased and increasing depth of ships of war, and the continuous silting of the river into the docks and basins of the yard, Woolwich would probably have remained one of the chief dockyards. Both these causes, however, operated. The depth of the "Nelson's" hold had to be lessened in order to ensure her passing Erith; and it was stated in the *Eighth Report of the Select Committee on Finance* (1818) that "the wharf wall at Woolwich, owing to the action of the tide on the foundation, is in a falling state, and in danger of being swept into the river, it being secured only in a temporary manner; and requires to be immediately rebuilt in a direction that will preserve it from similar injury hereafter, and prevent, in a great degree, that accumulation of mud which has, in the course of the last ten years, occasioned an expense of upwards of £125,692, and would threaten in time to render the yard useless." Till 1869, however, notwithstanding the recommendations of a parliamentary committee, and the frequent urgings of members on both sides of the House of Commons, Woolwich yard was kept open. Then, in accordance with a policy long commended, it was closed, steps were taken to dispose of the plant and material that remained, and the place itself was handed over, with its workshops and factories, to the War Department in 1872.

WOOLWICH DIVISION OF ROYAL MARINES.—About the same time that the dockyard was broken up, the division of marines—no longer in contact with ships and shipping—was abolished, and its strength was distributed between the divisions at Chatham and Plymouth.

CHATHAM DOCKYARD.—This dockyard, founded by Queen Elizabeth, though not on the present site, is situated on the right bank of the Medway, to which it presents a line of wharfage extending 10,000 feet, and of embankment 4500 feet more. The superficial contents may be estimated at about 500 acres. The old part of the yard has seven building-slips on the front, from which ships are launched into the river, all equal to the building of ships of the line, and three others for frigates and smaller vessels. In the same front are four dry docks communicating with the Medway. At the southern extremity of the yard is the ropery, 1248 feet in length and 47½ feet in width, in which are employed about 250 persons. It is equal to the manufacture of every description of cordage required for the naval service, including the largest size cable. The hemp houses, 306 feet long by 36 feet wide, are equal to the stowage of 1600 tons of hemp and 3000 hauls of yarn. Next to these are the slips and docks, with the working-sheds and artificers' shops close in the rear, an excellent smithery, timber-berths, seasoning sheds, deal and iron yard, &c., and beyond these, on the eastern extremity of the yard, the officers' houses and gardens. The superintendent's house is situated nearly in the centre of the yard. The lower or north-eastern part of the old yard is occupied by mast-ponds, mast-houses and slips, store-boat houses and slips, ballast wharf, timber-berths, and saw-pits.

Before the construction of the extension works in 1867–73, there was no wet dock or basin in Chatham-yard; but the

Medway, flowing along it in a fine sheet of water, in some degree answered the purpose of one. Owing to the shallowness of the water and the crooked navigation from Chatham round Upnor Point, ships were obliged to take in their water and ballast at one place, their stores and provisions at another, their guns, powder, and ammunition at a third; in consequence of which, a ship was usually longer in getting out to sea from Chatham than even from Deptford.

The necessity of improving the accommodation at Chatham forced itself upon the attention of those who were responsible for the navy many years before the opportunity came for effecting the improvements. Pepys records a visit to Chatham in July 1663, to inspect the site of a projected wet dock. It was estimated to cost £10,000, and Pepys remarked that "the place indeed is likely to be a very fit place when the king hath money to do it with." In effect, however, it was not taken in hand by the king, who allowed the Dutch, instead of docks, to be found in the Medway. It was not till 1867 that ground was broken for the extension works at Chatham, though the plans had been prepared and certain preparations made many months before, under the supervision of Colonel Sir Andrew Clarke, C.B. The extension works may be thus described. Three basins give access from Gillingham Reach, which formerly connected the mainland with the salt marshes. These marshes were covered with water every spring tide. The Government bought 150 acres of them, and proceeded to re-make the ground which forms the site of the new dockyard workshops and factories. The three basins communicate with each other by caissons, so that ships of the largest class can pass from the bend of the Medway at Gillingham to that at Upnor. Upnor Reach entrance, opposite Upnor Castle, is 80 feet wide, the others are 84 feet. The first (Upnor) basin is the repairing basin, which has an area of 22 acres, and a depth, in common with the others, of 33 feet at spring, and 30 feet at neap tides. On the south side of this basin, and opening into it, are four graving docks, each capable of receiving the largest man of war. From this basin a passage about 175 feet long leads to the "factory" basin, which has an area of 20 acres. Contiguous to it are being erected the engine and boiler factories, and the principal workshops necessary for iron war-ship building. Next to the "factory" basin is the fitting-out basin, with an area of 28 acres. In this place ships are to receive their sea stores and be got ready for service. Here, too, they will be dismantled and paid out of commission.

Very great engineering difficulties had to be contended against in prosecuting these works, owing chiefly to the soft mud and to the treacherous character of the ground on which foundations had to be laid. Convict labour was largely employed in the work of excavation, and in the manufacture of bricks, whereof 20,000,000 a year were turned out, at small cost, on the spot. The cost of these new works is reckoned at about £2,000,000.

A considerable piece of new ground (about 2000 feet in length by 200 in breadth) was added a few years ago to the upper part of the present Chatham dockyard, on which Mr Brunel erected one of the completest saw-mills in the United Kingdom. It is supposed to be equal to the power of fifty saw-pits and nearly one hundred sawyers, and is capable of supplying the dockyards of Chatham and Sheerness with all the straight-sawn timber that they can require. But the great advantage of the plan is in its application of the steam engine to the management and arrangement of timber, by which the labour and expense of a great number of horses are saved, and the obstruction and impediments to the general services of the yard avoided.

Since the introduction of iron as the material for ships' hulls, Chatham has taken a more prominent place amongst dockyards. Most of the iron ships built in the royal yards have been built at Chatham and Pembroke,—the capabilities being greater at Chatham, where the "Achilles," "Monarch," "Glatton," "Rupert," "Raleigh," "Bellorophon," "Sultan," "Alexandra," "Temeraire," and many also of the Musquito fleet of gunboats were built. At Chatham and Devonport the whole of the cordage required for the navy is manufactured; and, since 1869, the whole business of remanufacturing copper and old iron for the navy has been concentrated at Chatham.

The first division of royal marines, consisting of twenty-eight companies, is stationed at Chatham, in excellent barracks, situated near one of the extremities of the dockyard, and occupying nine acres of ground.

There was formerly a small victualling depot, situated partly in the parish of Chatham and partly in that of Rochester, from which the ships at Chatham and at Sheerness and the Nore received a supply of provisions and water. Ships now obtain their supplies from Deptford, except fresh meat and vegetables, which are obtained on local contracts on demand.

It may be found necessary to establish a fresh depot for victualling stores at Chatham when the port becomes developed as a place for fitting out and repairing as well as for building. This process of development is going on rapidly. In March 1873 the executive of the Sheerness steam reserve with their ship were removed to Chatham, and the steps necessary for transferring the principal powers and attributes of the exposed dockyard at Sheerness to the strongly defended port of Chatham will be quickly taken. The great difficulties of navigation in the Medway, combined with the successive forts and torpedo stations which stud the river, are calculated to make Chatham unassailable. As Hollingshead said of Lundy Island, there will be "no entrance but for friends." When the Chatham works shall have been finished, the question will probably be revived whether Sheerness should not, as has been often recommended, be closed; but the advantages of having even a small yard whither ships only slightly injured by sea or by the enemy can run for repair, without having to thread the reaches of the Medway up and down, are so great that it is unlikely the place will be abandoned.

In 1876 Chatham dockyard was raised to a rear-admiral's command. The number of workmen employed at Chatham yard in 1877 is 1478 established and 2022 hired men, at an aggregate cost of £220,138.

SHEERNESS DOCKYARD.—This dockyard is situated on a low point of land on the island of Sheppey, of which the soil is composed of sand and mud brought from the sea on the one side, and down the Medway on the other, and has so much contracted the mouth of that river as completely to command the entrance of it. The situation, in a military point of view, is a most important one, particularly from its vicinity to the North Sea and to the anchorage at the Nore; by which anchorage, and by the works of Sheerness, the mouths of the Thames and the Medway are completely defended.

As a situation for a dock, the objections to which it was liable are now in a great measure removed. On account of the low swampy ground on which it stood, fevers and agues were at one time so prevalent that shipwrights and other artificers were literally impressed and compelled to work at Sheerness. In process of time, however, a town sprung up close to the dockyard, and with it some little improvement by drainage, embankments, and other measures. Still it continued, for a considerable time, an unhealthy and disagreeable place. As a dockyard it was totally destitute of all convenience or arrangement; and

the whole premises, mixed among wharfs and buildings belonging to the Ordnance Department, did not cover more than 15 acres. The storehouses were dispersed in various parts of this space, and in so ruinous a state, that a ship hauled up in the mud was by far the best storehouse in the whole yard. There were two small inconvenient docks for frigates or smaller vessels. It was in fact a mere port of refitment, and might be considered as an appendage to Chatham.

The very limited capacity of Sheerness, and other considerations, led to the origination of the project of a naval arsenal at Northfleet, which, from change of circumstances, and from the important improvements now carried out at Sheerness, is not likely ever again to be revived. These improvements were of sufficient magnitude to render any establishment at Northfleet wholly unnecessary, by making Sheerness a very complete dockyard. Previously to carrying into execution this important undertaking, a committee of engineers and others was appointed, whose plan was afterwards minutely examined, and with some slight improvements adopted. The first stone was laid on the 19th August 1814, and the whole work was completed at an expense not far short of one million sterling. The additions, together with some part of the premises held by the War Department, make the whole area of the dockyard of Sheerness amount to upwards of 50 acres. The wharf wall on the south side of the basin in front of the mast-houses is 160 feet, and that on the river front 60 feet in width, lined on both sides with as complete a specimen of good and beautiful masonry of granite as any in the kingdom.

PORTSMOUTH DOCKYARD. — Portsmouth dockyard, founded by Henry VII., will always be considered as the grand naval arsenal of England, and the headquarters or general rendezvous of the British fleet. It appears at all times to have been regarded as a very important naval station, notwithstanding the rivalry of Southampton, which was the principal port in Plantagenet times. In 1225 an order was issued to the barons of the Cinque Ports to provide men for the king's galleys at Portsmouth. In 1226 the sum of £25, 14s. 4d. was paid to the masters and crews of the "king's two great ships at Portsmouth." In 1229, £40 was paid to the king's clerk for the repairs of the king's galleys and great ship at Portsmouth. King John on several occasions assembled his barons at Portsmouth for naval expeditions. He seems, moreover, to have aimed at increasing the accommodation there for ships. In May 1212 the sheriff of Southampton was commanded to cause the docks at Portsmouth to be inclosed with a strong wall, in the manner which the archdeacon of Taunton would point out, for the preservation of the king's ships and galleys. He was also to cause pent-houses to be erected for their stores and tackle. This was to be done immediately, lest the galleys or their stores should be injured in the coming winter.

In 1540, when the dockyard seems to have been regularly established, the area of the yard was comprised in 8 acres of ground, and abutted upon the harbour near what are now known as the King's Stairs. Cromwell added 2 acres in 1658; Charles II. added 8 in 1663, and 10 more in 1667. Between 1667 and 1710, 30 acres were reclaimed from harbour mud, or bought from the town, and various subsequent additions gave 90 acres as the area on which Portsmouth dockyard stood at the end of the last century. Early in Queen Victoria's reign the growth of the steam navy necessitated an enlargement of dock accommodation. In 1843 were ordered, and in 1848 were opened a fine steam basin holding 7 acres of water, and four new docks, the dockyard ground being extended to 115 acres in all. A few years more and the want of dock

room was as great as ever. Huge iron-clads, of a draught and length greater than had yet been known, required new docks and basins of special construction. The extension works at Chatham (see above) and Portsmouth were accordingly entered upon. At the present time (August 1877) great progress has been made with both sets of works, under the direction of Colonel Sir A. Clarke, C.B., R.E., and Colonel Pasley, R.E. When finished the Portsmouth new works will comprise a tidal basin, three floating basins (upon one of which four docks will abut), a large deep dock, entered from the tidal basin, two floating basin entrance locks, which may also be used as deep docks, and greatly increased wharfage and space for building storehouses and factories. The system of docks and basins will begin with the tidal basin, entered from the harbour by an opening 100 yards wide, and having a depth of 30 feet of water at low spring tides. The deep dock and the two locks at the head of this basin will carry 28 feet of water over the invert at low spring tides; the two latter will be the entrances to the repairing, rigging, and fitting-out basins, which will lead from each other in the order named. These locks will in themselves be magnificent docks, able to receive the largest iron-clad at once from the tidal basin. They will lead to the repairing basin, a vast excavation, of a parallelogram shape, which will measure 22 acres, and carry at high spring tides 35 feet of water. This depth of water will be common to the three basins, it may be made permanent by the closing of the lock gates, and one great use of the locks will be that vessels may be docked in them in any state of the tide without lowering the level of water in the inner basins, where the tide may be ponded at its highest level of 35 feet of water, if necessary. Having been raised to this level in the locks by ingress of water from the tidal basin, vessels will be able to pass inwards to the repairing and other basins, without any lessening of the depth of water. The four large docks of the repairing basin will have a depth of 30 feet of water on their sills, even when filled at high neap tides. Two of them are entirely finished, and the excavation of the others is far advanced. Opposite to these docks will be the entrance to the rigging basin, an excavation of 14 acres, in a trapezoid shape. The third, or fitting out basin, which will receive the ships when they have been repaired and rigged, will be a pentagon of 14 acres. On one side of this basin there will be a coal dépôt, so that vessels may leave the docks with their coals on board, ready for sea. In addition to these four basins and seven docks there is an entrance between the tidal basin of the new works and the steam basin of 1848, which will connect the old and new portions of the dockyard; and, as for wharfage, the harbour or north wall of the extension works will have 26 feet and the wall of the tidal basin 30 feet of water alongside it at low spring tides, making altogether three miles of wharfage accommodation in connection with the extension works, and that for ships of the largest class. The size of the whole dockyard will be more than doubled, for its present 115 acres will be increased by more than 177 acres of reclaimed mud land and fortifications glacié, making in all an exact measurement of 293 acres 2 roods and 29 perches. These great works were estimated when designed in 1865 to cost £3,000,000, exclusive of convict labour. They have given employment on the spot to upwards of 1600 free men and about 800 convicts. The latter are employed in brick-making, and have made upwards of 100,000,000 bricks since the works were begun.

A complete network of railway connects all parts of the yard with the docks and basins, and the whole with the neighbouring railroad to all parts of the kingdom, so that iron or coal can be put into waggons at Sheffield or Cardiff

and brought in a few hours, without change of medium, to the side of the ship which is to use the material.

This dockyard, accordingly, is by far the most capacious of all; and the safe and extensive harbour, the noble anchorage at Spithead, the central situation with respect to the English Channel and the opposite coast of France, render Portsmouth of the very first importance as a naval station; and in this view of it, every possible attention appears to have been paid to the extension and improvement of its dockyard.

In the centre of the old wharf-wall, facing the harbour, is the entrance into the great basin, whose dimensions are 380 by 260 feet, and its area $2\frac{1}{2}$ acres. Into this basin open four excellent dry docks, and on each of its sides is a dry dock opening into the harbour; and all of these six docks are capable of receiving ships of the largest class. Besides these is a double dock for frigates, the stern dock communicating through a lock with the harbour, and the head dock with another basin about 250 feet square. There is also a camber, with a wharf-wall on each side, 660 feet in length, and of sufficient width to admit of transports and merchant ships bringing stores to the dock-yard. In the same face of the yard are three building slips capable of receiving the largest ships, and a small one for sloops, besides two building slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of storehouses on the north-east side, and the rigging-house and sail-loft on the south-west side of the camber are magnificent buildings, the former occupying nearly 600 feet in length, exclusive of the two intermediate spaces, and nearly 60 feet in width, and the two latter 400 feet. The sea-store houses occupy a line of building which, with the three narrow openings between them of 25 feet each, extend 800 feet. The rope-house, tarring-house, and other appendages of the ropery are on the same scale, but since the suppression of the Portsmouth ropery (in 1869), and the concentration of rope-making at Devonport and Chatham, these premises have been used as general storehouses. The two sets of quadrangular storehouses, and the two corresponding buildings, with the intervening timber-berths and saw-pits, at the head of the dry docks, issuing from the great basin, are all excellent, and conveniently placed. The smithery is on a large scale, and contiguous to it are the various factories for metal work used in the building and repair of iron ships. Formerly there was also a copper mill, capable of turning out 300,000 sheets a year, besides bolts, bars, and gudgeons for ships' use. But since 1869 the whole business of remaking old metal of whatever kind has been concentrated at Chatham. Most of these factories were constructed under the direction of General Benthall. At the head of the north dock are the wood mills, at which every article of turnery, rabetting, &c., is performed for the use of the navy, from boring the chamber of a pump to the turning of a button for a chest of drawers. But the principal part of these mills is the remarkable machinery for making blocks, contrived by Brunel (see BLOCK-MACHINERY).

The northern extremity of the dock-yard is chiefly occupied with seasoning-sheds, saw-pits, and timber-berths, the working boat-house, and boat store-house. On the eastern extremity are situated the houses and gardens of the superintendent and principal officers of the yard, the chapel, and the late royal naval college.

Portsmouth yard, in 1877, employs 4910 men, at a cost of £324,844.

Naval College.—The establishment of a college at Portsmouth for the education of young gentlemen for the navy was first formed in 1729 under the title of the Naval Academy. It contained 40 scholars, the sons of the nobility and gentry. In 1806 it was reorganized under the name of the Royal Naval College, and the number of

scholars was raised from 40 to 70; of whom 40 were to consist of the sons of commissioned officers of the navy, and to receive their board, clothing, lodging, and education free of all expense, the remainder to consist of sons of noblemen, gentlemen, civil and military officers, on payment of £72 a year. The age of admission was from twelve and a half to fourteen years. No student to remain at college longer than three years; at the end of which time, or sooner if he should have completed the plan of education, he was to be discharged into one of Her Majesty's ships, the college time being reckoned two years of the six required to be served to qualify for such a commission. In 1837 the Royal Naval College for the education of young gentlemen for the navy was abolished, and by an order in council of 1838 it was reopened as an establishment for the scientific education of a certain number of officers and mates of the naval service, the latter to have passed both their examinations in seamanship and in navigation, and to remain one year in the college. A limited number of commissioned officers of any rank were also permitted to study at the college, but no expense was incurred on their account.¹

Naval Architectural School.—The number of students formerly did not exceed 24. Candidates were admitted by examination at stated periods; the age of entrance was from fifteen to seventeen, and the duration of apprenticeship seven years. At the expiration of their apprenticeship they were eligible to all the situations in the ship-building department of Her Majesty's dockyards, to be there employed as supernumeraries until regular vacancies might occur. This school, which was subsequently embodied with South Kensington, is now incorporated with Greenwich College.

Victualling Yard.—There were formerly two victualling establishments at this port,—the one in Portsmouth town, the other across the harbour, at a place called Weevil,—both of them inconveniently situated for supplying the ships with water and provisions, more especially such as had to take them on board at Spithead. The former consisted chiefly of provision stores and magazines, with a tide-mill and a bakery; at the latter there were a cooperage and a brewery. The victualling establishments are now consolidated at Gosport, and the Royal Clarence Victualling

¹ On 1st February 1873 Portsmouth College was superseded by the Royal Naval College at Greenwich. The means of education provided at Portsmouth were at once too limited and not technical enough. The disused buildings of Greenwich hospital furnished the extra space required, and the new system of higher education of naval officers, which was pronounced by the select committee on that subject to be necessary, was considered and carried out by Mr Gough, then first lord of the Admiralty. Rear-admiral Sir Cooper Key, K.C.B., was the first president of the college. The minute of the Board of Admiralty consequent upon the Order in Council of 16th January 1873, whereby Greenwich College was founded, states that—"My Lords intend that the Royal Naval College at Greenwich shall be so organized as to provide for the education of naval officers of all ranks above that of midshipman, in all branches of theoretical and scientific study bearing upon their profession; but my Lords will continue the instruction given in the 'Excellent' gunnery ship as heretofore, and arrangements for instruction in practical surveying will also be continued at Portsmouth. My Lords desire, by the establishment of the college, to give to the executive officers of the navy generally every possible advantage in respect of scientific education, but no arrangements will be made at all prejudicing the all-important practical training in the active duties of their profession." All matters relating to the particular classes of officers admitted to study, and the different subjects of study, are determined by such regulations as may from time to time be laid down by the Admiralty. Special pecuniary concessions are made to officers on half-pay who may enter for study, and officers of the lower grades are put upon full pay, while in all cases there is a Government contribution in aid of the mess. Special professional inducements to study are offered, and everything is done to make the college answer thoroughly the purposes for which it was founded. Practical knowledge is taught on the Thames and its estuaries, as theory is taught in the college.

Yard is a very fine establishment. At this victualling yard, as at Deptford and Plymouth, large quantities of biscuit and flour are manufactured. Casks and barricoes are also made; but with these exceptions there is no manufacture at Gosport. The depôt is supplied with sea provisions and clothing from Deptford, and re-issues them to the fleet at Portsmouth. There is an excellent slaughter yard in the place, where cattle delivered under contract are slain, and the meat issued to the fleet.

Haslar Hospital.—This magnificent hospital for the reception of sick and wounded lies at the point seawards, on the Gosport side of the harbour. It is in charge of a resident medical inspector-general, who is assisted by a competent medical and clinical staff.

The second division of royal marines, consisting of twenty six companies, is stationed at Forton barracks, on the Gosport side. Sixteen companies of royal marine artillery have excellent quarters at Eastney, three miles from Portsmouth, opposite St Helen's, and at Fort Cumberland, a half mile from Eastney.

PLYMOUTH DOCKYARD—The naval station of Plymouth is hardly inferior to that of Portsmouth. It possesses one of the finest harbours in the world, capable of containing, in perfect security at their moorings, not less than a hundred sail of the line, and by means of the breakwater it may boast of an excellent roadstead for eighteen or twenty sail of the line. The old dockyard has only one basin, without gates, but the dimensions are 300 by 280 feet. The excellent harbour of Hamoaze, on the western bank of which the wharf-wall extends, almost compensates for the want of other basins, especially as the depth of water allows the largest ships to range along the jetties, and receive their stores on board immediately from the wharf.

Plymouth dockyard proper extends in a circular sweep along the shores of Hamoaze 3500 feet, its width about the middle, where it is greatest, being 1600, and at each extremity 1000 feet, making its superficial contents about 96 acres. The land front is about 2850 feet. In the line facing the harbour are two dry docks for ships of the first rate, a double dock for seventy-four gun ships, communicating with Hamoaze, and another dock for ships of the line, opening into the basin. There is, besides, a graving-dock without gates, and a canal or camber similar to that in Portsmouth yard, for the admission of vessels bringing stores into the yard, which, communicating with the boat-pond, cuts the dock-yard nearly into two parts. There are five jetties projecting from the entrances of the dry docks into Hamoaze, alongside of which ships are conveniently brought when undocked. All these are situated between the centre and the northern extremity of the harbour line. On the southern part are three building slips for the largest class of ships and two for smaller vessels, the outer mast-pond and mast-houses, timber-berths, saw-pits, and smithery. Higher up, on this end of the yard is an extensive mast-pond and mast-locks, with plank-houses over them, and, above these, three hemp magazines, contiguous to which is the finest ropery in the kingdom, consisting of two ranges of buildings, one the laying-house, the other the spinning-house, each being 1200 feet in length, and three stories in height. In the construction of the new rope-house no wood has been used excepting the shingles of the roof, to which the slates are fastened. All the rest is of iron. The ribs and girders of the floors are of cast iron, covered over with Yorkshire paving stone, and the doors, window frames, and staircases are all of cast iron, so that the whole building may be considered as proof against fire.

The northern half of the yard, besides the docks and basin, with all the appropriate working sheds and artificers'

shops, contains a cluster of very elegant stone buildings, ranged round a quadrangle, the longest sides being about 450 feet, and the shortest 300 feet. Within the quadrangle are also two new ranges of buildings, in which iron has been used in the place of wood. These buildings consist of magazines for different kinds of stores, rigging-houses, and sail-lofts. The northern and upper part of the yard is occupied by a range of handsome houses, with good gardens behind them, for the admiral-superintendent and the principal officers of the yard, the chapel, the guard-house, and pay-office, stables for the officers and the teams, and a fine reservoir of fresh water for the supply of the yard.

Plymouth is not only a good building and repairing yard, on account of its excellent docks and slips, and the great length of line along the Hamoaze, but also a good refitting yard.

A large addition has been made to Plymouth yard by the fine establishment of Keyham steam factory which adjoins it, with a water frontage of about 1300 feet, with two steam basins—one 630 feet by 560 feet, and another 700 feet by 400 feet. There are also excellent graving docks leading into these basins, around which are coal sheds, storehouses, boat berths, engineers' shops, boiler factories, and all the necessary appliances of mast shears, cranes, and capstans worked by hydraulic or steam machinery. There is no railway within the yard connecting it with the general system of railroad, though means are being taken to secure a junction with the narrow gauge line through Okehampton. Traction engines, called "camels," at present discharge most of the work of a railway.

The number of men borne in Plymouth yard in 1877 is 4336, costing £292,563.

Plymouth Victualling Establishment.—The Royal William Victualling Yard stands on the eastern entrance to Hamoaze, on about 11 acres of ground,—adjoining 4 acres on its south side, on which stand two small forts, and a reservoir containing about 8000 tons of water, which supplies the fleet—the water being brought from Dartmoor.

Plymouth Hospital is a handsome building of stone, or rather a series of separate buildings, regularly arranged, in which respect, as admitting a freer circulation of air, it is perhaps superior to that of Haslar.

The third division of royal marines, consisting of thirty companies, is stationed at Plymouth. The barracks, situated at Stonehouse, are very airy and spacious.

PEMBROKE DOCKYARD—This dockyard was established in 1814, and is now used merely as a building-yard. It is situated on the southern shore of Milford Haven, not two miles from the town of Pembroke. It includes an area of about 60 acres, its surface descending in a gradual slope to the water's edge, along the shore of which there is a frontage of about 2350 feet. It has a dock, and 14 building slips, 6 of which are for first-rates. The largest wooden ship of the royal navy, the "Duke of Wellington," 131 guns, was launched from this yard. Here, too, were built the "Thunderer" and the "Fury," the huge mastless iron-clads, intended with the "Devastation" and the "Stanniches" to form the sea police of the coasts.

OTHER YARDS.—In addition to the foregoing, there are several small naval yards—at Haulbowline in the Cove of Cork, at Gibraltar, Malta, Antigua, Halifax, Bermuda, Kingston (Jamaica), Cape of Good Hope, Trincomalee, and Hong Kong.

DOCKYARD OFFICERS—The management of the dock-yards is intrusted to a superintendent, either a rear-admiral or captain; a master attendant and his assistant; a chief constructor and assistant; a store-keeper, an accountant, who is also store-receiver, and a director of police.

RESERVES IN DOCKYARDS—At each of the ports where there is a dockyard, Pembroke excepted, a certain number of ships when put out of commission, or new ships not commissioned, are laid up in reserve, being classed in one of the four classes, according to the state in which they are when paid off, or the state of forwardness for further service to which they may be ordered by the Admiralty. The reserves used to be comprehended in what was called "the ordinary." But since twenty years the reserve ships have been placed under a captain of the navy, the flag captain of the dockyard admiral. The captain of the reserve is responsible for the care of ship and engines, and also for the due preservation and readiness for immediate service of all the ship's stores and equipment. The latter, excepting very heavy gear, which is kept on board, are kept in special storehouses at the dockyard, where all the items of the ship's "establishment," from cordage to hammocks and lanterns, are kept ready for immediate shipment. These arrangements apply to the ships in the first division of the reserve. Competent technical officers, all the ship's artificers in port not otherwise employed, and a large body of seamen are under the orders of the captain of the reserve.

HISTORY OF MANAGEMENT OF DOCKYARDS.—When Henry VIII. first established a regular king's dockyard at Woolwich, he appointed a board, consisting of certain commissioners for the management of all naval matters, and it is curious enough (see the *Pepysian Collection of Manuscripts* in the university of Cambridge), that the regulations which he made for the civil government of the navy, and which were in the reign of Edward VI. revised, arranged, and turned into ordinances, form the broad basis of all the subsequent instructions given to the several officers to whom the management of the civil affairs of the navy has been committed. The commissioners of the navy then consisted of the vice-admiral of England, the master of the ordnance, the surveyor of the marine causes, the treasurer, comptroller, general surveyor of the victualling, clerk of the ships, and clerk of the stores. They had each their particular duties; and once a week they were ordered to meet at their office on Tower Hill, and once a month report their proceedings to the lord high admiral.

In 1609 the principal officers for conducting the civil affairs of the navy were suspended, in consequence of many abuses being complained of; and other commissioners were appointed, with powers to manage, settle, and put the affairs of the navy into a proper train, and to prevent, by such measures as might appear to be necessary, the continuance of the many great frauds and abuses which had prevailed. A similar commission was renewed in 1618, which in a full and minute report detailed and explained those frauds and abuses. That commission, which ended on the death of James I., was renewed by his successor, and remained in force till 1628, when it was dissolved, and the management of the navy was restored to the board of officers established by Edward VI.

In the disturbed reign of Charles I. the navy was suffered to go to decay, but by the extraordinary exertions of Cromwell it was raised to a height which it had never before reached; it again declined, however, under the administration of his son. At the Restoration, the duke of York, of whom Macaulay wrote that he was the only honest man in his dockyards, was appointed lord high admiral, and by his advice a committee was appointed to consider a plan he had drawn out for the future regulation of the affairs of the navy, at which he himself presided. "In all naval affairs," say the commissioners of revision, "he appears to have acted with the advice and assistance of Mr Samuel Pepys, who first held the

office of clerk of the acts, and was afterwards secretary of the Admiralty,—a man of extraordinary knowledge in all that related to the business of that department, of great talents, and the most indefatigable industry."

The entire management of the navy was now in the hands of the duke, as lord high admiral, by whom three new commissioners were appointed to act with the treasurer of the navy, the comptroller, the surveyor, and clerk of the acts, as principal officers and commissioners of the navy. A book of instructions, drawn out by Pepys, was sent to the navy board for its guidance. A rapid progress was made in the repair and augmentation of the fleet; but the duke being called away, in consequence of the Dutch war in 1664, the example of zeal and industry set by Pepys was not sufficient, in the duke's absence, to prevent neglect and mismanagement in every department, except his own.

From 1673 to 1679, the office of lord high admiral was put in commission with Prince Rupert at the head of it. The king, through Pepys, arranged all naval affairs; but in the latter year, when the duke was sent abroad, and Pepys to the Tower, a new set of men were made commissioners of the navy, who, without experience, ability, or industry, suffered the navy to go to decay. "All the wise regulations," say the commissioners of revision, "formed during the administration of the duke of York, were neglected, and such supineness and waste appear to have prevailed as, at the end of not more than five years, when he was recalled to the office of lord high admiral, only twenty-two ships, none larger than a fourth-rate, with two fireships, were at sea; those in the harbour were quite unfit for service, even the thirty new ships which he had left building had been suffered to fall into a state of great decay, and hardly any stores were found to remain in the dock-yards." Pepys was reappointed secretary of the Admiralty; the king instituted an inquiry into the characters and abilities of the first ship-builders in England, and by the advice of Pepys added Sir Anthony Deane, eminent in that profession, with three others, to the former principal officers. The old commissioners were directed entirely to confine their attention to the business of a committee of accounts. To each of the new commissioners was intrusted a distinct branch of the proposed reform, and it appears that, highly to their credit, "they performed what they had undertaken in less time than was allowed for it, and at less expense," having completed their business to the general satisfaction of the public two months before the Revolution. The business of the navy, thus methodized and settled, remained undisturbed by that event.

It will readily be seen that the vast increase of our naval force since that time has necessarily required many additional orders and regulations, some of which, from circumstances, were not compatible with each other; some were given to one dockyard and not to another; others in one yard became obsolete, while they continued to be acted upon in another; so that there was no longer that uniformity in the management which it is desirable—indeed, essentially necessary—to preserve. From the year 1764 to 1804, when the king appointed a commission "for revising and digesting the civil affairs of his navy," the attention of the lords of the admiralty and the navy board had frequently been directed to this important subject; but nothing was done to forward so desirable an arrangement, except that Sir Charles Middleton (afterwards Lord Barham), when comptroller of the navy, classed and digested under distinct heads all orders and regulations prior to the year 1786. The commissioners of naval inquiry, appointed in 1803, state the necessity of revising the instructions, and digesting the immense mass of orders

issued to the dockyard officers, and regret that a work of such utility should not have been completed. The commission consisted of Admiral Lord Barham, John Fordyce, Esq., Admiral Sir Roger Curtis, Bart., Vice-Admiral Domett, and Ambrose Serle, Esq. They made fifteen distinct reports, the date of the first being 13th June 1805, of the last the 6th March 1808. All these except two were printed by order of the House of Commons, and were mostly carried into effect by Orders in Council. One of the two not printed is an inquiry into the state of the navy at different periods, and of naval timber; the other relates to the formation of a new dock-yard at Northfleet.

These reports led to the establishment, for the first time, in all dockyards, of one uniform system of management, by which it was hoped incalculable advantages would have been secured, in the preventing of frauds, in the saving of labour and materials, and consequently time and expense, and in securing better workmanship in the construction of ships; but the system was cumbersome and expensive, and has given way to other more judicious management.

The management of the dockyards, and of all the civil affairs of the navy, was formerly intrusted to certain commissioners, of whom the comptroller of the navy, three surveyors, and seven other commissioners formed a board at Somerset House, for the general direction and superintendence of the civil concerns of the navy, subject to the control of the Admiralty. At most of the yards, both home and foreign, was a commissioner of the navy, who was nearly always a naval officer of the rank of captain. The foreign yards over which a commissioner presided were Bermuda, Cape of Good Hope, Gibraltar, Halifax, Jamaica, Malta, Quebec, Kingston (Canada), and Trincomalee. These, with the five belonging to the home yards, Woolwich (including Deptford), Chatham, Sheerness, Portsmouth, and Plymouth, made the whole number of commissioners of the navy amount to twenty-four.

In 1832 Sir James Graham, then first lord of the Admiralty, substituted for these commissioners five departmental officers, who were called "principal" officers of the navy. These were the surveyor of the navy, the accountant-general, the storekeeper-general, the comptroller of victualling and transports, the director general of the medical department (see ADMIRALTY). To these were subsequently added a director of works and a director of transports. In 1869 this arrangement was modified. The post of storekeeper-general was abolished, and the duties discharged by him were incorporated with the department of the comptroller of the navy, who had a few years before superseded the more limited surveyor of the navy; the office of comptroller of victualling was also modified, and the work of his department was incorporated with that of the Admiralty generally, under the control of the sea lord. The business of purchase and sale for each of the five departments was at the same time concentrated in one purchase department under a director of navy contracts.

Victualling establishments.—At each of the dockyards at Deptford, Portsmouth, and Plymouth are victualling establishments for supplying the fleet with provisions and water; and also at Cork, Cape of Good Hope, Gibraltar, Malta, Jamaica, Halifax, Trincomalee, Rio de Janeiro, Barbados, Sierra Leone, Hong Kong, Valparaiso, and Bermuda. The victualling board at Somerset House consisted formerly of a chairman and deputy chairman, and five other commissioners, two secretaries, a registrar of securities, and 136 clerks.

The transport board having been dissolved at the end of the great French war, its twofold duties were divided between the navy and victualling boards; those which concerned the hiring of transports devolved on the commissioners of the

navy, and those which related to the sick and hurt department, on the commissioners of the victualling board, on whom also devolved the direction and superintendence of all the naval hospitals at home and abroad. These have also merged in the Admiralty, where there is a transport department under the supervision of a director of transports,—a naval officer, first appointed after the Crimean war.

Officers of the dockyard.—The principal officers of an established dockyard, prior to 1833, were—1, the commissioner; 2, the master attendant; 3, the master shipwright; 4, the clerk of the check; 5, the storekeeper; 6, the clerk of the survey; to which were added the subordinate officers of timber-master, and the master measurer. By the regulations in 1833, the commissioner was superseded by a superintendent, the offices of clerk of the check, clerk of the survey, and master measurer were abolished, and a store-receiver was substituted for the timber-master. Many subordinate offices were abolished, and the whole system of working the men and keeping the accounts was simplified and amended. Some idea may be formed of the diminution of the expense by the simple fact that, while in the ordinary estimate of the navy for 1817 the establishment of officers in Portsmouth yard was £50,065, in 1833 it was only £19,803, and in 1853, £20,121. To this last, however, must be added the salaries of officers employed in the steam factory, which amounted to £2555. The principal officers in the factory are—1, the chief engineer and inspector of machinery, 2, his assistant, 3, assistant inspector of machinery; 4, foreman of the factory; 5, foreman of boilermakers; 6, pay-clerk and book-keeper.

At one time the men in the dockyards were employed almost wholly on job and task-work. Between 1850 and the present time they have been almost wholly on a day pay smaller than that given in the general trade, but having a title to a pension, contingently upon good service and good behaviour, attached to it. In 1869 Mr Childers cut down to a considerable extent the "establishment" system of dockyardmen, replaced the vacancies with hired men on higher pay, but without a title to pension, and with the usual liability to discharge at a week's notice when work is slack. The salary system, with its concomitant vested interests, was not found to be productive of quick and therefore of economical work. Mr Childers's alteration improved matters not a little, but job and task-work, besides being more in accordance with the usages of the day, is far more likely to interest and stimulate the men. One great advantage, however, of the salary system is the discouragement it gives to strikes. The conditions under which alone pensions are earned act as deterrents.

In ordinary years the number of workmen of all kinds required for the service of the dockyards is, in round numbers, 16,000.

Defence of the yards.—In the year 1847 the workmen of the several dockyards were enrolled into a corps for the defence of the yards; and certain numbers were trained to the use of the great gun exercise, so that each of the dockyard battalions had some artillery attached to them. In 1854 the corps fell into desuetude, and was finally swallowed up in the volunteer movement.

FOREIGN DOCKYARDS.—The dockyards of the principal foreign states at the present time (1877) are as follows:—

Austria	... Pola and Trieste
Denmark	... Copenhagen
France	... Cherbourg, Brest, L'Orient, Rochefort, Toulon.
Germany	... Kiel, Dantzic, Wilhelmshafen.
Italy	... Spezzia, Naples, Castellamare
Russia	... Cronstadt, St Petersburg, Sevastopol, Nicholaieff.

DOCTOR, denoting etymologically a teacher, is the title conferred by the highest university degree. Originally there were only two steps in graduation, those of bachelor and master, and the title doctor was given to certain masters as an alternative or as a merely honorary appellation. It is in this sense that the word is to be understood in the phrase *Doctor Angelicus* applied to Aquinas, and in many other familiar instances of a similar kind. The process by which the doctorate became established as a third degree, distinct from and superior to that of master, cannot be very clearly traced. At Bologna it seems to have been conferred in the faculty of law as early as the 12th century, but there is no sufficient authority for the statement commonly made that the celebrated Irnerius drew up the formulary for the ceremonial, and that Bulgarus was the first who took the degree. Paris, the other great university of the Middle Ages, conferred the degree in the faculty of divinity, according to Antony Wood, some time after 1150, the earliest recipients being Peter Lombard and Gilbert de la Portree. In England the degree was introduced in the reign of John or of Henry III. Both in England and on the Continent it was confined for a considerable period to the faculties of law and divinity; it was not until the 14th century that it began to be conferred in medicine, and in England it is still unknown in the faculty of arts. In Germany, however, there is a degree of doctor of philosophy. The doctorate of music was first conferred at Oxford and Cambridge; its use in Germany is comparatively recent. See UNIVERSITIES.

DOCTORS' COMMONS was a society of ecclesiastical lawyers in London, forming a distinct profession for the practice of the civil and canon laws. Some members of the profession purchased in 1567 a site near St Paul's, on which at their own expense they erected houses for the residence of the judges and advocates, and proper buildings for holding the ecclesiastical and admiralty courts. "In the year 1768 a royal charter was obtained by virtue of which the then members of the society and their successors were incorporated under the name and title of 'The College of Doctors of Law exercising in the Ecclesiastical and Admiralty Courts' The college consists of a president (the dean of Arches for the time being) and of those doctors of law who, having regularly taken that degree in either of the universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the archbishop of Canterbury, shall have been elected fellows in the manner prescribed by the charter." The judges of the archiepiscopal courts were always selected from this college. By 20 and 21 Vict. c. 77 (the Act to amend the law relating to Probate and Letters of Administration) § 116 and 117, the college is empowered to sell its real and personal estate and to surrender its charter to Her Majesty, and it is enacted that on such surrender the college shall be dissolved and the property thereof shall belong to the then existing members as tenants in common for their own use and benefit. In pursuance of this enactment the college has been dissolved and the ecclesiastical courts are now open to the whole bar.

DOCTRINAIRES, the name applied by its opponents to a small but very influential political party in France which made itself prominent after the restoration of the Bourbons in 1815. The *doctrine* or fundamental principle on which its action was based was that the sole justification of any form of government was the manner in which it exercised its power. Rejecting the claim of divine right, whether urged for monarchy or for republicanism, the doctrinaires were opposed alike to the ultra-royalists and to the revolutionists. In the chamber they occupied the left centre, and thus marked themselves out from the centre or ministerialist and the left or opposition party.

While maintaining the re-established dynasty their efforts were mainly directed towards moulding the constitution into a shape resembling as nearly as possible that of England. The leaders of the doctrinaires were Royer-Collard, the Duc de Broglie, and Guizot. After the revolution of 1830 several of them came into power and proved strong supporters of constitutional monarchy on the model that has existed in England since the reign of William. The name doctrinaires fell entirely out of use after 1848, but the principles of the party have been faithfully represented since that date by the Orleanists. See FRANCE.

DODD, DR WILLIAM (1729-1777), an unfortunate English divine, eldest son of the Rev. William Dodd, many years vicar of Bourne, in Lincolnshire was born there in May 1729. He was sent, at the age of sixteen, to the university of Cambridge, where he was admitted a sizar of Clare Hall in 1745. He took the degree of B.A. in 1750, being in the list of wranglers. On leaving the university, he married a young woman of the name of Perkins, the daughter of a vergier. She had a more than questionable reputation, and her extravagant habits contributed in no small degree to her husband's disgrace and ruin. In 1751 he was ordained deacon, and in 1753 priest, and he soon became a popular and celebrated preacher. His first preferment was the lectureship of West-Ham and Bow. In 1754 he was also chosen lecturer of St Olave's, Hart Street; and in 1757 he took the degree of M.A. at Cambridge. He was a strenuous supporter of the Magdalen Hospital, which was founded in 1758, and soon afterwards became preacher at the chapel of that charity. In 1763 he obtained a prebend at Brecon, and in the same year he was appointed one of the king's chaplains,—soon after which the education of Philip Stanhope, afterwards earl of Chesterfield, was committed to his care. In 1766 he went to Cambridge, and took the degree of LL.D. At this period he was held in high estimation; but eager for further advancement, he unhappily entered on courses which in the end proved the occasion of his ruin. On the living of St George's, Hanover Square, becoming vacant, he wrote an anonymous letter to the wife of the lord chancellor offering three thousand guineas if, by her assistance, he was promoted to the benefice. This letter having been traced to him, a complaint was immediately made to the king, and he was dismissed with disgrace from his office of chaplain. After residing for some time at Geneva and Paris, he returned to England in 1776. He still continued to exercise his clerical functions, but his extravagant mode of life soon involved him in difficulties. To meet the demands of his creditors he forged a bond on his former pupil Lord Chesterfield for £4200, and actually received the money. But he was detected, committed to prison, tried at the Old Bailey, found guilty, and sentenced to death; and, in spite of numerous applications for mercy, he was executed at Tyburn on the 27th June 1777. Dr Samuel Johnson was very zealous in pleading for a pardon, and a petition from the city of London received 23,000 signatures. Dr Dodd was a voluminous writer, and possessed considerable abilities, with but little judgment and much vanity. His *Beauties of Shakespeare*, published before he entered the church, was long a well-known work; and his *Thoughts in Prison*, a poem in blank verse, written in the interval between his conviction and his execution, naturally attracted much attention. He published a large number of sermons and other theological works. An accurate list of his various writings is prefixed to his *Thoughts in Prison*.

DODDER (Frisian *dodd*, a bunch, Dutch *dot*, ravelled thread), the popular name of the annual, leafless, twining,

epiphytic plants forming the genus *Cuscuta* and natural order *Cuscutaceæ* or, according to some botanists, the tribe *Cuscutæ* of the *Convolvulaceæ*. All the species are natives of temperate regions, and all have strong acrid properties. The flowers, which grow in clusters, have a quinque-partite, coloured calyx; scales alternating with the corolline lobes, carpels forming a syncarpous ovary; the albumen of these seeds fleshy; and the embryo spiral, filiform, and acotyledonous. On coming in contact with the living stem of some other plant the seedling dodder throws out a sucker, by which it attaches itself and commences to absorb the sap of its foster-parent; it then soon ceases to have any connection with the ground. As it grows, it throws out fresh suckers, establishing itself firmly on its victim. After making a few turns round one stem the dodder finds its way to another, and thus it continues twining and branching till it resembles "fine, closely-tangled, wet catgut." The injury done to flax, clover, hop, and bean crops by species of dodder is often very great. *C. europæa*, the Greater Dodder, is found parasitic on nettles, thistles, vetches, and the hop; *C. Epilinum*, on flax; *C. Epithymum*, on furze, ling, and thyme. *C. Trifolii*, the Clover Dodder, is perhaps a sub-species of the last-mentioned. For a figure of *C. verrucosa*, the Warty Dodder, see vol. iv. pl. x.

DODDRIDGE, PHILIP (1702–1751), a celebrated nonconformist divine, was born in 1702. His father, Daniel Doddridge, was a London merchant, and his mother the orphan daughter of the Rev. John Bauman, a Bohemian clergyman who had fled to England to escape religious persecution, and had held for some time the mastership of the grammar school at Kingston-upon-Thames. He was the youngest of a family of twenty, of whom there was at his birth only one other child, a daughter, surviving. It is also remarkable that he himself at his birth was put aside as actually dead, and was only preserved alive owing to the accidental glance of one of the attendants, who fancied she perceived a feeble heaving of the infant's chest, and was successful in rekindling the almost extinguished vital spark. Before he could read, his mother taught him the history of the Old and New Testament by the assistance of some blue Dutch tiles; and these stories, he says, were the means of enforcing such good impressions on his heart as never afterwards wore out. When sufficiently old to leave the paternal roof he was placed under the tuition of the Rev. Mr Scott, who taught a private school in London, and on attaining his tenth year he was sent to the grammar school at Kingston-upon-Thames. About 1715 he was removed to a private school at St Albans, where he began to keep an exact account of his time in order the better to improve himself by private meditation and study, and was in the habit during his walks of entering the neighbouring cottages to read to the inmates a few pages from the Bible or from some religious book. Through the interest of friends a proposal was made to him, in 1719, which would have enabled him to enter the English bar; but receiving at the same time an invitation to study for the ministry, he preferred the latter, and shortly thereafter removed to the academy for dissenters at Kibworth in Leicestershire, taught at that time by the Rev. John Jennings. Mr Jennings having in 1722 received an invitation to Hinckley, the academy was removed thither; and in 1723 Doddridge, having finished his studies, accepted an invitation to succeed him in the ministry at Kibworth. He had also been mentioned by Jennings, who died in 1723, as the person most fitted to extend his plans and views as an instructor of candidates for the ministry, but it was not till 1729 that, at a general meeting of nonconformist ministers, he was chosen to conduct the academy established in that year at Harborough. In the same year he received an invitation from the congregation

at Northampton, which he accepted. Here he continued his ministrations till 1751, when the rapid progress of consumptive disease caused him to seek the advantages of a milder climate. Accordingly he sailed for Lisbon on the 30th September of that year; but the change was unavailing, and he died there on 26th October.

His popularity as a preacher is said to have been chiefly due to his "high susceptibility, joined with physical advantages and perfect sincerity." His sermons were mostly practical in character, and his great aim was to cultivate in his hearers a spiritual and devotional frame of mind. "He endeavoured," he says, "to write on the common general principles of Christianity, and not in the narrow spirit of any particular party." "There is," says his biographer, "a remarkable delicacy and caution evinced in the works of Dr Doddridge whenever the subject approaches the disputed points of theology. The genuine expressions of the sacred writers are then employed, and the reader is allowed to draw his own conclusions, unbiassed by the prejudices of human authorities." Those portions of his theological lectures which treat on the matter alluded to, substantiate this statement. His principal works are *The Rise and Progress of Religion in the Soul*, *The Family Expositor*, *Life of Colonel Gardiner*, and *A Course of Metaphysical, Ethical, and Theological Lectures*. He also published several courses of sermons on particular topics, and is the author of many well-known hymns.

See *Memoirs*, by Rev Job Orton, 1766; *Letters to and from Dr Doddridge*, by Rev Thomas Stedman, 1790, and *Correspondence and Diary*, in 5 vols. by his grandson, John Doddridge Humphreys, 1829.

DÖDERLEIN, JOHANN CHRISTOPH WILHELM LUDWIG (1791–1863), a distinguished German philologist, was born at Jena on the 19th December 1791. His father, Johann Christoph Doderlein, professor of theology at Jena, was celebrated for his varied learning, for his eloquence as a preacher, and for the important influence he exerted in guiding the transition movement from strict orthodoxy to a freer theology. Ludwig Doderlein, after receiving his preliminary education at Windsheim and Schulpforta, studied at Munich, Heidelberg, Erlangen, and Berlin. He devoted his chief attention to philology under the instruction of such men as Thiersch, Creuzer, Voss, Wolf, Boeckh, and Böttmann. In 1815, soon after completing his studies at Berlin, he accepted the appointment of ordinary professor of philology in the academy of Bern. In 1819 he was transferred to Erlangen, where he became second professor of philology in the university and rector of the gymnasium. In 1827 he became first professor of philology and rhetoric and director of the philological seminary. He continued to discharge the duties of both these offices until within a short period of his death, which occurred on the 9th November 1863. Döderlein's most valuable work as a philologist was rendered in the department of etymology and lexicography. He is best known by his *Lateinische Synonymen und Etymologien* (6 vols., Leipsic, 1826–38), and his *Homeric Glossarium* (3 vols., Erlangen, 1850–58). To the same class belong his *Lateinische Wortbildung* (Leipsic, 1838), *Handbuch der Lateinischen Synonymik* (Leipsic, 1839), and the *Handbuch der Lateinischen Etymologie* (Leipsic, 1841), besides various works of a more elementary kind intended for the use of schools and gymnasia. Most of the works named have been translated into English. To critical philology Döderlein contributed valuable editions of Tacitus (*Opera*, 1847; *Germania*, with a German translation) and Horace (*Epistolæ*, with a German translation, 1856–8; *Satiræ*, 1860). His *Reden und Aufsätzen* (Erlangen, 1843–7) and *Öffentliche Reden* (1860) consist chiefly of academic addresses dealing with various subjects in pedagogy and philology.

DODO, from the Portuguese *Dóudo* (a simpleton¹), a large bird formerly inhabiting the island of Mauritius, but now extinct—the *Didus ineptus* of Linnæus

Brief mention of this remarkable creature has already been made (see BIRDS, vol. iii. p. 732), but some further particulars may be welcome. The precise year in which the Portuguese discovered the island we now know as Mauritius is undetermined; various dates from 1502 to 1545 having been assigned. Mascaregnas, their leader, seems to have called it *Cerne*, from a notion that it must be the island of that name mentioned by Pliny; but most authors have insisted that it was known to the seamen of that nation as *Ilha do Cisne*—perhaps but a corruption of *Cerne*, and brought about by their finding it stocked with large fowls, which, though not aquatic, they likened to Swans, the most familiar to them of bulky birds. However, the experience of the Portuguese is unfortunately lost to us, and nothing positive can be asserted of the island or its inhabitants (none of whom, it should be observed, were human) until 1598, when the Dutch, under Van Neck, arrived there and renamed it *Mauritius*. A narrative of this voyage was published in 1601, if not earlier, and has been often reprinted. Here we have birds spoken of as big as Swans or bigger, with large heads, no wings, and a tail consisting of a few curly feathers. The Dutch called them *Walghvogels* (the word is variously spelled), i.e., nauseous birds, because, as is said, no cooking made them palatable; but another and perhaps better reason, for it was admitted that their breast was tender, is also assigned, namely, that this island-paradise afforded an abundance of superior fare. De Bry gives two admirably quaint prints of the doings of the Hollanders, and in one of them the *Walghvogel* appears, being the earliest published representation of its unwieldy form, with a footnote stating that the voyagers brought an example alive to Holland. Among the company there was a draughtsman, and from a sketch of his Clusius, a few years after, gave a figure of the bird, which he vaguely called "*Gallinaceus Gallus peregrinus*," but described rather fully. Meanwhile two other Dutch fleets had visited Mauritius. One of them had rather an accomplished artist on board, and his drawings fortunately still exist.² Of the other a journal kept by one of the skippers was subsequently published. This in the main corroborates what has been before said of the birds, but adds the curious fact that they were now called by some *Dodaarsen* and by others *Dronten*.³

Henceforth Dutch narrators, though several times mentioning the bird, fail to supply any important fact in its history. Their navigators, however, were not idle, and found work for their naturalists and painters. Clusius says that in 1605 he saw at Panw's House in Leyden a Dodo's foot,⁴ which he minutely describes. Of late years a copy of Clusius's work has been discovered in the high

school of Utrecht, in which is pasted an original drawing by Van de Venne superscribed "*Vera effigies huius avis Walghvogel* (quæ & a nantis *Dodaers* propter fœdam posterioris partis crassitiem nuncupatur), qualis viua Amsterdamnm perlata est ex insula Mauriti. Anno M.DC.XXVI." Now a good many paintings of the Dodo by a celebrated artist named Roelandt Savery, who was born at Courtray in 1576 and died in 1639, have long been known, and it has always been understood that these were drawn from the life. Proof, however, of the limning of a living Dodo in Holland at that period had hitherto been wanting. There can now be no longer any doubt of the fact; and the paintings by this artist of the Dodo at Berlin and Vienna—dated respectively 1626 and 1628—as well as the picture by Goiemare, belonging to the Duke of Northumberland, at Sion House, dated 1627, may be with greater plausibility than ever considered portraits of a captive bird. It is even probable that this was not the first example which had sat to a painter in Europe. In the private library of the late Emperor Francis of Austria is a series of pictures of various animals, supposed to be by the Dutch artist Hoefnagel, who was born about 1545. One of these represents a Dodo, and, if there be no mistake in Von Franenfeld's ascription, it must almost certainly have been painted before 1626, while there is reason to think that the original may have been kept in the *vivarium* of the then Emperor Rudolf II., and that the portion of a Dodo's head, which was found in the Museum at Prague about 1850, belonged to this example. The other pictures by Roelandt Savery, of which may be mentioned that at the Hague, that in the possession of the Zoological Society of London (formerly Broderip's), that in the Schönborn collection at Pommersfelden near Bamberg, and that belonging to Dr Seyffery at Stuttgart are undated, but were probably all painted about the same time (viz. 1626 to 1628). The large picture in the British Museum, once belonging to Sir Hans Sloane, by an unknown artist, but supposed to be by Roelandt Savery, is also undated; while the still larger one at Oxford (considered to be by the younger Savery) bears a much later date, 1651. Undated also is a picture said to be by Pieter Holsteyn, and in the possession of Dr A. van der Willige at Haarlem in Holland.

In 1628 we have the evidence of the first English observer of the bird—one Emanuel Altham, who mentions it in two letters written on the same day from Mauritius to his brother at home. These have only of late, through the intervention of Dr Wilmot, been brought to light.⁵ In one he says: "Yon shall recene . . . a strange fowle: which I had at the Iland Mauritius called by ye portingalls a Do Do: which for the rareness thereof I hope wilbe welcome to you." The passage in the other letter is to the same effect, with the addition of the words "if it live." Nothing more is known of this valuable consignment. In the same fleet with Altham sailed Herbert, whose *Travels* ran through several editions and have been long quoted. It is plain that he could not have reached Mauritius till 1629, though 1627 has been usually assigned as the date of his visit. The fullest account he gives of the bird is in his edition of 1638, and in the curiously affected style of many writers of the period. It will be enough to quote the beginning: "The Dodo comes first to a description: here, and in *Dygarrois*⁶ (and no where else, that ever I could see or heare of) is generated the Dodo (a Portuguese name it is, and has reference to her simpleness,) a Bird which for shape and rareness might be call'd a Phoenix (wer't in Arabia:)"—the rest of the passage is entertaining, but the whole has been often reprinted. Herbert, it may be remarked, when he could see a possible Cymric similarity,

¹ Alewyn and Colle, in their *Woordenschat der twee Taalen Portugeesch en Nederduitsch* (Amsterdam 1714, p. 362), render it "Een sot, dwaas, dol, of, uitzinnig mensch."

² It is from one of these that the figures of the large extinct Parrot (*Lophopittacus mauritianus*), before given (BIRDS, vol. iii. p. 732), were taken. Prof. Schlegel has announced his intention of immediately publishing these sketches in *fac-simile*.

³ The etymology of these names has been much discussed. That of the latter, which has generally been adopted by German and French authorities, seems to defy investigation, but the former has been shown by Prof. Schlegel (*Versl. en Mededeel. K. Akad. Wetensch. ii. pp. 255 et seqq.*) to be the homely name of the Dabchick or Little Grebe (*Podiceps minor*), of which the Dutchmen were reminded by the round stern and tail diminished to a tuft that characterized the Dodo. The same learned authority suggests that Dodo is a corruption of *Dodaars*, but, as will presently be seen, we herein think him mistaken.

⁴ What has become of the specimen (which may have been a relic of the bird brought home by Van Neck's squadron) is not known. Broderip and the late Dr Gray have suggested its identity with that now in the British Museum, but on what grounds is not apparent.

⁵ *Proc. Zool. Soc.* 1874, pp. 447-449.

⁶ *I.e.*, Rodriguez; an error, as we shall see.

was weak as an etymologist, but his positive statement, corroborated as it is by Altham, cannot be set aside, and hence we do not hesitate to assign a Portuguese derivation for the word.¹ Herbert also gave a figure of the bird.

Proceeding chronologically we next come upon a curious bit of evidence. This is contained in a MS. diary kept between 1626 and 1640 by Thomas Crossfield of Queen's College, Oxford, where, under the year 1634, mention is casually made of one Mr Gosling "who bestowed the Dodar (a blacke Indian bird) vpon ye Anatomy school." Nothing more is known of it. About 1638, Sir Hamon Lestrange tells us, as he walked London streets he saw the picture of a strange fowl hung out on a cloth canvas, and going in to see it found a great bird kept in a chamber "somewhat bigger than the largest Turkey cock, and so legged and footed, but shorter and thicker." The keeper called it a Dodo and shewed the visitors how his captive would swallow "large pebble stones . . . as bigge as nutmegs."

In 1651 Morisot published an account of a voyage made by François Canche, who professed to have passed fifteen days in Mauritius, or "l'isle de Saincte Apollonie," as he called it, in 1638. According to De Flacourt the narrative is not very trustworthy, and indeed certain statements are obviously inaccurate. Canche says he saw there birds bigger than Swans, which he describes so as to leave no doubt of his meaning Dodos, but perhaps the most important facts (if they be facts) that he relates are that they had a cry like a Gosling ("il a un cry comme l'oison"), and that they laid a single white egg, "gros comme un pain d'un sol," on a mass of grass in the forests. He calls them "oiseaux de Nazaret," perhaps, as a marginal note informs us, from an island of that name which was then supposed to lie more to the northward, but is now known to have no existence.

In the catalogue of Tradescant's *Collection of Rarities*, preserved at South Lambeth, published in 1656, we have entered among the "Whole Birds" a "Dodar from the island Mauritius, it is not able to flie being so big." This specimen may well have been the skin of the bird seen by Lestrange some eighteen years before, but anyhow we are able to trace the specimen through Willughby, Lhwyd, and Hyde, till it passed in or before 1684 to the Ashmolean collection at Oxford. In 1755 it was ordered to be destroyed, but, in accordance with the original orders of Ashmole, its head and right foot were preserved, and still ornament the Museum of that University. In the second edition of a *Catalogue of many Natural Rarities*, &c., to be seen at the place formerly called the Music House, near the West End of St Paul's Church, collected by one Hubert alias Forbes, and published in 1665, mention is made of a "legge of a Dodo, a great heavy bird that cannot fly, it is a Bird of the Mauricius Island." This is supposed to have subsequently passed into the possession of the Royal Society. At all events such a specimen is included in Grew's list of their treasures which was published in 1681. This was afterwards transferred to the British Museum, where it still reposes. As may be seen it is a left foot, without the integuments, but it differs sufficiently in size from the Oxford specimen to forbid its having been part of the same individual. In 1666 Olearius brought out the *Gottorffisches Kunst Kammer*, wherein he describes the head of a *Walghvogel*, which some sixty years later was removed to the Museum at Copenhagen, and is now preserved there,

¹ Hence we venture to dispute Prof. Schlegel's supposed origin of "Dolo." The Portuguese must have been the prior nomenclators, and if, as is most likely, some of their nation, or men acquainted with their language, were employed to pilot the Hollanders, we see at once how the first Dutch name *Walghvogel* would give way. The meaning of *Dodo* not being plain to the Dutch, they would, as is the habit of sailors, convert it into something they did understand. Then *Dodiers* would easily suggest itself.

having been the means of first leading zoologists, under the guidance of Prof. Reinhardt, to recognize the true affinities of the bird.

Little more remains to be told. For brevity's sake we have passed over all but the principal narratives of voyagers or other notices of the bird. A compendious bibliography, up to the year 1848, will be found in Strickland's classical work,² and the list was continued by Von Franenfeld³ for twenty years later. The last evidence we have of the Dodo's existence is furnished by a journal kept by Benj. Harry, and now in the British Museum (MSS. Addit. 3668. 11. D). This shows its survival till 1681, but the writer's sole remark upon it is that its "flesh is very hard." The successive occupation of the island by different masters seems to have destroyed every tradition relating to the bird, and doubts began to arise whether such a creature had ever existed. Duncan, in 1828, shewed how ill-founded these doubts were, and some ten years later Broderip with much diligence collected all the available evidence into an admirable essay, which in its turn was succeeded by Strickland's monograph just mentioned. But in the meanwhile little was done towards obtaining any material advance in our knowledge, Prof. Reinhardt's determination of its affinity to the Pigeons (*Columbæ*) excepted; and it was hardly until Clark's discovery in 1865 (*BIRDS*, vol. iii. p. 732) of a large number of Dodo's remains, that zoologists generally were prepared to accept that affinity without question. The examination of bone after bone by Prof. Owen and others confirmed the judgment of the Danish naturalist, and there is now no possibility of any different view being successfully maintained.

The causes which led to the extirpation of this ponderous Pigeon have been discussed in a former article, and nothing new can be added on that branch of the subject; but it will be remembered that the Dodo does not stand alone in its fate, and that two more or less nearly allied birds inhabiting the sister islands of Réunion and Rodriguez have in like manner disappeared from the face of the earth. (A. N.)

DODONA, in Epirus, was the seat of the most ancient and venerable of all Hellenic sanctuaries. In the plain of the Dodonea, and on the banks of the neighbouring Achelous, there dwelt in times long anterior to history the race of Helli or Hellenes, who thence spread into Thessaly and Greece. In after times the Greeks of the south looked on the inhabitants of Epirus as barbarians; nevertheless for Dodona they always preserved a certain reverence, and the temple there was the object of frequent missions from them. This temple was dedicated to the Pelasgic Zeus, the wielder of the thunderbolt in the storms so frequent in Epirus. Connected with the temple was an oracle which enjoyed more reputation in Greece than any other save that at Delphi, and which would seem to date from more early times than the worship of Zeus; for the normal method of gathering the responses of the oracle was by listening to the rustling of an old oak tree, which was supposed to be the seat of the deity, and by taking thence an augury of the future. We seem here to have a remnant of the very ancient and widely diffused tree-worship. Sometimes, however, auguries were taken in other manners, being drawn from the moaning of doves in the branches, the murmur of a fountain which rose close by, or the resounding of the wind in the brazen tripods which formed a circle all round the temple. The oracle was thus, compared with the articulate responses of Delphi, dumb, but none the less constantly consulted. Cræsus proposed

² *The Dodo and its Kindred*, &c. By H. E. Strickland and A. G. Melville. London · 1848 4to

³ *Neu aufgefundene Abbildung des Dronie*, u. s. w. Erläutert von Georg Ritter von Frauenfeld. Wien · 1868 fol.

to it his well-known question; Lysander sought to obtain from it a sanction for his ambitious views; the Athenians frequently appealed to its authority during the Peloponnesian war. But the most frequent votaries were the neighbouring tribes of the Acarnanians and Ætolians, together with the Boeotians, who claimed a special connection with the district.

Dodona is not unfrequently mentioned by ancient writers. Homer speaks of it twice, once calling it the stormy abode of Selli who sleep on the ground and wash not their feet, and on the second occasion describing a visit of Odysseus to the oracle. Hesiod has left us a complete description of the Dodonæa or Hellopiæ, which he calls a district full of corn-fields, of herds and flocks and of shepherds, where is built on an extremity (ἐπ' ἑσχατῇ) Dodona, where Zeus dwells in the stem of an oak (φηγός). Herodotus tells a story which he learned at Egyptian Thebes, that the oracle of Dodona was founded by an Egyptian priestess who was carried away by the Phœnicians, but says that the local legend substitutes for this priestess a black dove, a substitution in which he tries to find a rational meaning. From later writers we learn that in historical times there was worshipped, together with Zeus, an Asiatic goddess under the name Dione, and thenceforward the responses were given by the priestesses of the latter, who were called doves, and not by the Selli.

As to the site of Dodona there has been a good deal of discussion. We know from the authorities that the town was situated in a fertile vale at the foot of the mountain Tomarus, whence issued a multitude of springs, and that it was on the eastern boundary of Epirus, and on the confines of Thesprotia and Molossis. We are further told that Dodona was a two days' journey from Ambracia, and a journey of four days from Buthrotum. It would also appear certain that it was in a region of frequent thunderstorms. In accordance with these indications, Colonel Leake fixed on Castritza near Janina in Epirus, at the foot of the mountain Mitzikéli, as the site of Dodona. But his reasons are not conclusive. Quite recently excavations have been undertaken at a spot in the valley of Dramisus, a few leagues south of Castritza, at the foot of Mount Olytzika, where Leake found the remains of a theatre and of two temples. This has usually been supposed to be the site of Passaron, the ancient capital of the Molossian kings. But these excavations have brought to light not only many antiquities, but tablets *ex voto* bearing dedicatory inscriptions to Zeus Naios and Dione, and many fragments of tripods, whence it would seem highly probable that the opinion of Leake must be given up, and the new site definitely fixed upon as that of Dodona. (See Leake, *Northern Greece*, vols. i. iv.; *Revue Archéologique* for 1877, pp. 329, 397.)

The temple of Dodona was destroyed by the Ætolians in 219 B.C., but the oracle survived to the times of Pausanias and even of the emperor Julian.

DODSLEY, ROBERT (1703–1764), an eminent bookseller and versatile writer, born in 1703 at Mansfield, Nottinghamshire, where his father is said to have been a schoolmaster. In his youth he was apprenticed to a stocking-weaver, from whom he ran away, taking service as a footman. His first poetical attempts seem to have been made when he was a servant in the family of the Hon. Mrs. Lowther, and were published by subscription under the title of *The Muse in Livery, or the Footman's Miscellany* (1732). This was followed by an elegant little satirical farce called *The Toyshop*, the hint of which is said to have been taken from Randolph's *Muse's Looking-glass*, and which, having obtained the approbation of Pope, was acted at Covent Garden with great success. The profits accruing from the sale of these two publications enabled him to

establish himself as bookseller in Pall-Mall; and his merit and enterprising spirit soon made him one of the foremost publishers of the day. One of the first copyrights he published was that of Johnson's *London*, for which he gave ten guineas in 1738, and he was afterwards the leader of the association of booksellers that furnished Johnson with funds for the preparation of his *English Dictionary*. In 1737 a new piece of his own, entitled *The King and the Miller of Mansfield*, was received with undiminished applause. His immediately subsequent farces, however, were not so popular. In 1738 he published a collection of his dramatic works in one volume 8vo, under the modest title of *Trifles*, which was followed by the *Triumph of Peace*, a masque, occasioned by the treaty of Aix-la-Chapelle, and a fragment on *Public Virtue*. Dodsley was also the author of the *Economy of Human Life*, a work which acquired considerable celebrity; but for this it is supposed he was not a little indebted to the mistaken opinion which long prevailed that it was the production of Lord Chesterfield. The name of Dodsley is from this period associated with much of the literature of his time. Among other things he projected *The Annual Register*, commenced in 1758, *The Museum*, *The World*, and *The Preceptor*. To these various works Horace Walpole, Akenside, Soame Jenyns, Lord Lyttelton, Lord Chesterfield, Edmund Burke, and others were contributors. His own latest production was a tragedy entitled *Cleone*, which was received with even greater enthusiasm than his earlier works. It had a long run at Covent Garden, two thousand copies of it were sold on the day of publication, and it passed through four editions within the year. It has long, however, ceased to be read, and apart from his fame as a publisher Dodsley is now chiefly remembered on account of his *Select Collections of Old Plays* (12 vols. 12mo, London, 1744; 2d edition, 12 vols. 8vo, 1780). He died at Durham while on a visit to a friend, 25th September 1764.

DODWELL, EDWARD (1767–1832), an English antiquarian writer and draughtsman of considerable note in the department of classical investigation. He belonged to the same family as Henry Dodwell the theologian, and received his education at Cambridge. Being under no necessity to adopt a profession as a means of livelihood, he devoted himself entirely to his favourite pursuits, travelled for several years—from 1801 to 1806—in Greece, and spent the rest of his life for the most part in Italy, either at Naples or at Rome. An illness contracted in 1830 during a visit of exploration to the Sabine Mountains, undermined his constitution and ultimately resulted in his death, which took place at Rome in May 1832. His widow, a daughter of Count Giraud, was thirty years his junior, and after his death became famous as the “beautiful” countess of Spaur, and played a considerable rôle in the political life of the Papal city.

His works are—*A Classical and Topographical Tour through Greece*, 2 vols., London, 1819, of which a German translation by Sickler was published at Meiningen in 1821; *Views in Greece*, consisting of thirty coloured plates, London, 1821; and *Views and Descriptions of Cyclopean and Pelasgic Remains in Italy and Greece*, London 1834. The last work, which contains 130 plates, was brought out simultaneously at Paris with a French text.

DODWELL, HENRY (1641–1711), a learned controversial writer, was born at Dublin in October 1641. His father had once been possessed of considerable property in Connanght, but having lost it at the rebellion settled at York in 1648. Here Henry received his preliminary education at the free school. By the death of his parents he was reduced in early life to the greatest poverty. In 1654 he was sent by his uncle to Trinity College, Dublin, of which he was soon afterwards chosen scholar and fellow. Having conscientious objections to take

orders he relinquished his fellowship in 1666, and resided for some time at Oxford, Dublin, and London successively. In 1688 he was elected Camden professor of history at Oxford, but in 1691 he was deprived of his professorship for refusing to take the oaths of allegiance to William and Mary. Retiring to Shottesbrooke in Berkshire, and living on the produce of a small estate in Ireland, which he had at first generously relinquished in favour of a near relation, he devoted himself to those literary labours in chronology and ecclesiastical polity on which his fame now rests. In the former department he published—*Discourse on the Phœnician History of Sanchoniathon* (1681); *Annales Thucydidei et Xenophontei* (1696), *Chronologia Græco-Romana pro Hypothesibus Dion Halicarnassæ* (1692), *Annales Velleiani, Quintiliani, Statiani* (1698); and a larger treatise entitled *De Veteribus Græcorum Romanorumque Cyclis, obiterque de Cyclo Judæorum ac Ætate Christi, Dissertationes* (1701). All these obtained considerable reputation, and were frequently reprinted. Gibbon speaks of his learning as “immense,” and says that his “skill in employing facts is equal to his learning.” In the department of ecclesiastical polity his works are more numerous and of much less value, his judgment being far inferior to his power of research. In his earlier writings he was regarded as one of the greatest champions of the non-jurors; but the absurd doctrine which he afterwards promulgated, that immortality could be enjoyed only by those who had received baptism from the hands of one set of regularly ordained clergy, and was therefore a privilege from which dissenters were hopelessly excluded, justly deprived him of the confidence even of his friends. It is interesting, however, in view of the recent revival of the same doctrine, to know that he published in 1706 a treatise professing to prove from Scripture and the first fathers that the soul is naturally mortal. Dodwell died at Shottesbrooke, 7th June 1711. His eldest son Henry is known as the author of a pamphlet entitled *Christianity not founded on Argument*, to which a reply was published by his brother William, who was besides engaged in a controversy with Dr Conyers Middleton on the subject of miracles.

DOG, a name common to several species of *Canidae*—a family of Carnivorous Mammals widely distributed over nearly every part of the globe. Many of the species belonging to this family, as the wolf and the jackal, are social animals, hunting in packs, and are readily tamed; while in confinement they show little or no repugnance to breeding. In a group thus eminently capable of domestication, it is not surprising that in the earliest times one or more species should have been brought under the dominion of man, or that under human care the domestic dog should have become, as Baron Cuvier calls it, “the completest, the most singular, and the most useful conquest ever made by man.” There is sufficient evidence to show that the dog existed in the domesticated state during prehistoric times; consequently neither history nor tradition is available to solve the question of its origin. That must be decided, if at all, by the naturalist, and the variety of opinion existing on this point at the present time renders it exceedingly improbable that the parentage of the dog will ever be ascertained with certainty. Some suppose that all our breeds have sprung from a single wild source, others that they are the product of the blending of several distinct species. Of the former, the majority regard the wolf as the parent form, others favour the claims of the jackal, while a few regard them as the descendants of an extinct species, and point to the fossil remains of a large dog, found in the later Tertiary deposits, as the probable wild stock. The prevalent belief at the present day is probably that which regards the domestic dog as the pro-

duct of the crossing of several species, living and extinct. This opinion is founded on such considerations as the presence in the earliest historic times of many breeds (totally distinct from each other, and nearly resembling existing forms), the existence of wild species of dogs in all quarters of the globe, the fondness of savage man for taming wild animals, and the extreme improbability that among so many presumably equally tameable canine species only one should have been chosen for domestication. Nor is it to be forgotten, as Darwin has well shown, that fear of man in most wild animals is a gradually acquired instinct, and that before its acquirement a wild species would have been much more readily tamed than after. Thus the wild dog of the Falkland Islands (*Canis antarcticus*), when these were first visited by man, approached him without sign either of fear or of aversion. The weightiest reason for this opinion, however, lies in the fact that many of the breeds of domestic dogs, found in different countries, bear a more or less striking resemblance to the wild species still existing in those countries. The Esquimaux dogs of North America so closely resemble the wolf of the same regions, both in appearance and in voice, that Sir J. Richardson on one occasion mistook a pack of those wild animals for a troop of Indian dogs; and the Indians are said to take the young of wolves in order to improve their canine breed, which would seem to prove that the dog and wolf are sufficiently fertile *inter se*. The Hare Indian or Mackenzie River Dog, although somewhat smaller in size than the prairie wolf (*Canis latrans*) occurring in the same regions, so resembles the latter that Richardson could detect no decided difference in form. It seems, in fact, to bear the same relation to the prairie wolf that the Esquimaux dog does to the great grey wolf already mentioned. The wolf certainly exhibits few peculiarly dog-like qualities, being both ferocious and cowardly, and showing no attachment to man, but instances, nevertheless, are on record of tamed wolves which in their gentleness, in love for their masters, and in intelligence, showed true dog-like capacity. The Esquimaux dogs are likewise decidedly wolfish in disposition, showing little or no attachment to their owners, and sometimes, it is said, even attacking them when pressed by hunger. Distinct varieties of the wolf occur in Europe and in India, and such European breeds as the shepherd dog of Hungary so closely resemble the wolf that an Hungarian has been known to mistake that animal for one of his own dogs; while certain of the Hindoo pariah dogs are said by Blyth to resemble the Indian variety of wolf. The large semi-domesticated dogs of the northern parts of both hemispheres may thus be regarded as principally derived from the various species and varieties of wolves still existing there. The period of gestation in the wolf and dog is the same, being 63 days in both. In the tropical regions of the Old World the wolf disappears, and with it the prevalence of wolf-like dogs, their places being taken by smaller breeds, such as certain of the pariah dogs of India and of Egypt, between which and the jackals abounding in those countries no structural difference can, according to Geoffroy Saint-Hilaire, be pointed out. Their period of gestation agrees with that of the dog and wolf, and like dogs, tamed jackals when caressed “will,” says Darwin, “jump about for joy, wag their tails, lower their ears, lick their master’s hands, couch down and even throw themselves on the ground belly upwards;” when frightened, also, they carry their tails between their legs. Jackals associate readily with dogs, and their hybrid offspring are not sterile; there is also an instance on record of one of these which barked like an ordinary dog. The habit of barking, so characteristic of dogs, is not, however, universal among them, the domestic dogs of Guinea and certain Mexican breeds being described

as dumb. This faculty appears to be readily lost and to be capable of reacquirement. The domestic dogs which ran wild on the island of Juan Fernandez are said to have lost the power of barking in 33 years, and to have gradually reacquired it on removal from the island. The Hare Indian Dog makes an attempt at barking, which usually ends in a howl, but the young of this breed born in the Zoological Gardens seem to possess this faculty to the full extent. In tropical America, where jackals are unknown, there are several wild species of dogs to which the domestic breeds of those regions bear a considerable resemblance, and at the present day the Arawak Indians cross their dogs with an aboriginal wild species for the purpose of improving the breed. In Australia the Dingo, regarded by many as constituting a distinct species indigenous to that country, its remains having been found in caves associated with those of other extinct mammals, occurs both in the wild state and domesticated at the present day. Darwin, after reviewing this question, concludes that "it is highly probable that the domestic dogs of the world have descended from two good species of wolves (*Canis lupus* and *C. latrans*), and from two or three other doubtful species of wolves, namely, the European, Indian, and North African forms, from at least one or two South American canine species, from several races or species of the jackal, and perhaps from one or more extinct species."

Remains of the dog, of Neolithic age, occur in the kitchen-middens of Denmark, and in similar deposits in Switzerland. In Denmark the earliest known dog is followed, in the Bronze period, by a larger breed, and that by a still larger form in the succeeding or Iron period; while a somewhat similar succession occurs in Switzerland. These successive changes, however, may merely indicate the appearance in those countries of new races of prehistoric man, who brought with them their own dogs. In historic times the earliest records of the dog are to be found in the figures of these animals on Egyptian monuments from three to five thousand years old; and these show that thus early, such varieties as the hound, greyhound, watch-dog, and turnspit were cultivated on the banks of the Nile. By the ancient Egyptians the dog was worshipped under the title Anubis, as the genius of the River Nile,—the appearance of Sirius, the dog star, corresponding with the time of the annual rise of that river. The city of Cynopolis was built in its honour, and there its worship was carried on with great pomp. Certain kinds of dogs were regularly sacrificed to Anubis, their bodies being afterwards embalmed; and occasionally the mummies of these are still found. The earliest record of the dog in sacred history is in connection with the sojourn of the Israelites in Egypt; and the religious homage paid to it by their oppressors may probably explain why the Jews were taught to regard it as unclean. Under Moslem law, which in many matters was founded upon Jewish practices, the dog occupies an equally degraded position; and throughout Mahometan countries at the present day, their generally wretched condition bears ample testimony to the neglect and ill-treatment to which for centuries they have been subjected. The pariah dogs of Eastern cities know no master; they prowl about the streets in troops, eating whatever garbage may come in their way, thus serving the useful purpose of scavengers, and occasionally receiving a meal from the more humane of the inhabitants. On no account, however, must even the garments of an orthodox Mahometan be defiled by their touch, and such is the intelligence and sagacity of these ownerless curs that, having become aware by painful experience of this religious prejudice, they seem to take the greatest care to avoid giving such offence. The value set upon the dog by the Egyptians seems to have been shared in by the ancient

Greeks and Romans, who possessed many breeds closely allied to still existing forms. Those early breeds, however, are remarkable for the entire absence of pendulous ears, which do not make their appearance till near the decline of the Roman empire. By both Greeks and Romans they were employed in the chase, and in war, and for the latter purpose they were armed with spiked collars, and sometimes even with a coat of mail. Corinth was said to have been saved by 50 war dogs, which attacked the enemy that had landed while the garrison slept, and which fought with unbounded courage till all were killed except one, which succeeded in rousing the garrison. Shakespeare thus put no figure of speech in the mouth of Antony when he exclaims—

"Cry havoc, and let slip the dogs of war."

Dogs are naturally carnivorous, preferring flesh that is slightly putrid, but they can also live on vegetable food, and in countries where the dog itself is eaten, it is generally thus fed. In drinking it laps with its tongue, and it never perspires, although when heated its tongue hangs from its mouth, and a fluid runs from it. When about to go to sleep, no matter where, it turns round and round, and scratches the ground with its forepaws as if to form a hollow conch; and in this seemingly senseless action it is no doubt continuing a habit once found useful to its wild progenitors. Its sense of smells and hearing are exceedingly acute, and many suppose that the remarkable power possessed by the dog, in common with the cat, of finding its way for great distances along unknown roads may be due to the exercise of the former sense. The differences that obtain between the various breeds of dogs are very great, the skulls, according to Cuvier, differing more from each other than they do in the different species of a natural genus. The molar teeth, which normally consist of 6 pairs above and 7 below, sometimes number 7 pairs above and below, while in the hairless dog of Egypt the teeth are sometimes reduced to a single molar on each side, incisors and canines being entirely wanting. Some varieties are six times as long as others, excluding the tail, and the number of vertebrae in the latter organ is also exceedingly various; nor is the number of mammae always uniform, there being 5 on each side in some, and 4 in others, while occasionally the number on the two sides is unequal.

While man has thus bestowed great attention on the physical development of the dog, and availing himself of natural variations has, by careful selection and intercrossing, moulded the dog into an almost infinite variety of forms, he has also, by education, developed its moral and intellectual capabilities, so that the dog may, in this respect, be said to have, within its own limits, kept pace with its master's advancement; and it is undoubtedly owing to a certain community of feeling existing between dog and man that this domestic animal has, since the earliest times, been regarded as the companion as well as the humble servant of mankind. There are few human passions not shared in by the dog. It is, like him, subject to anger, jealousy, envy, love, hatred, and grief; it shows gratitude, pride, generosity, and fear. It sympathizes with man in his troubles, and there are numerous instances on record of its showing sympathy for the distressed of its own kind. It remembers, and is evidently assisted thereto, as man is, by the association of ideas; that it is not devoid of imagination may be assumed from the fact that it dreams, pursuing in its sleep imaginary game. Its judgment is often singularly correct; while it may almost be said to have a religion, in which man is its god, and his will its rule of conduct, disobedience to which produces an evident feeling of shame and a quiet submission to punishment. It shares with man in awe of the unknown, and the most

courageous dog will often tremble at the sudden rustle of a leaf. While the possession of such faculties has rendered him fit above all other animals for the companionship of man, the physical and intellectual qualities characteristic of the various breeds have been seized upon and developed to their utmost by man, so as to enable him to use the dog for a great variety of purposes, what these are will appear in the following necessarily brief account of the more important breeds of dogs.

According to Professor Fitzinger, there are at least 189 distinct varieties of the domestic dog, and when it is considered that the origin of many if not most of these is uncertain, it is not surprising that considerable difference of opinion should exist as to the most natural mode of grouping them together. Their arrangement into the following six races, founded to a certain extent on the form and development of the ears, probably affords an approximation to a natural classification, viz., WOLF-DOGS, GREYHOUNDS, SPANIELS, HOUNDS, MASTIFFS, and TERRIERS.

I. WOLF-DOGS.—Throughout the northern regions of both hemispheres there are several breeds of semi-domesticated wolf-like dogs having nearly erect ears, and long woolly hair; these include among others the dogs of the Esquimaux and the Kamtchadales. The Esquimaux Dog is usually of a black and white colour, nearly as large as a mastiff, with a fine bushy tail, and sharp pointed muzzle. It is of the greatest value to the inhabitants of the boreal regions of America in hunting the seal, bear, and reindeer; while it is equally useful as a beast of burden, carrying loads on its back—a kind of work for which dogs are by no means well suited—and drawing sledges over the snow. On a good road half a dozen of these dogs will draw, it is said, from 8 to 10 cwt., at the rate of 7 miles an hour; and Kane, the Arctic traveller, tells how that number of dogs, well worn by previous travel, carried him with a fully burdened sledge, between seven and eight hundred miles during the first fortnight after leaving his ship—a mean rate of 57 miles a day. According to the same authority, the training of these dogs is of the most ungracious sort. "I never heard," he says, "a kind accent from the Esquimaux to his dog. The driver's whip of walrus hide, some 20 feet long, a stone or a lump of ice skilfully directed, an imprecation loud and sharp, made emphatic by the fist or foot, and a grudging ration of seal's meat, make up the winter's entertainment of an Esquimaux team." Owing to the ill-treatment to which they are thus habitually subjected, they are highly irritable and difficult to manage, and in sleighing it is necessary to have a well-trained dog as leader, to whom the driver speaks, and by whom the other dogs in the team are guided. They readily relapse into the wild state, and have been known thus to hunt the reindeer in packs like wolves. These dogs have borne a prominent part in Arctic exploration, and much of the difficult work done in this field would have been well-nigh impossible without them. The Kamtchatka dogs are also used for sledging, and are famed for their swiftness and endurance. During summer they run at large and cater for themselves, returning in winter to their masters, who feed them principally with the heads of dried fish.

The Sheep-dog.—In Eastern countries where the sheep follow the shepherd, the duties that fall upon the dog are simpler, and require less intelligence, than those performed by the European breeds. Their task is chiefly to defend the flocks and herds from wild beasts and robbers, and for this purpose the wolf-like Turkoman Watch-dog and the Sheep-dog of Natolia are, by their great strength and courage, eminently fitted. The former is described by Sir J. McNeill as a shaggy animal, nearly as large as the Newfoundland dog, and very fierce and powerful, the dam of the specimen he describes having killed a full-grown wolf

without assistance. The sheep-dog of Europe is generally classed among the wolf-like dogs, owing to the erect or semi-erect character of its ears, its pointed nose, and shaggy covering; and Buffon, for such reasons, regarded it as nearest to the primitive type of the domestic dog. It is more reasonable to suppose with Martiu (*History of the Dog*) that those points "only indicate purity of breed unalloyed by admixture with other varieties." The fact that its life is spent almost entirely out of doors, and that it has little or no opportunity of mixing with dogs other than of its own kind, would tend to preserve uniformity in external appearance; while its high cerebral development and intelligence prove beyond a doubt that the breed of sheep-dogs is one of the most highly improved, and in this respect remotest from the primitive type. Its whole intellect is devoted to the one duty of tending its master's flocks, and in the performance of this it is equally sagacious, vigilant, and patient. At a word, or even a look, from its master, it will gather the sheep, scattered for miles around, to one place. During and after the snowstorms to which highland districts are so frequently exposed, the sheep-dog is invaluable in saving its master's property from almost total destruction. Without it the Highlands of Scotland would be almost useless for sheep-farming purposes. "It would require," says the Ettrick Shepherd, "more hands to manage a stock of sheep, gather them from the hills, force them into houses and folds, and drive them to markets, than the profits of the whole stock would be capable of maintaining." The sheep-dog stands about

FIG 1—Sheep Dog

15 inches high, is covered with long shaggy hair of a black colour varied with dark grey or fulvous brown, and its tail is of moderate length, slightly recurved and bushy. In disposition it is quiet; and although not quarrelsome, it shows great courage in defending its charge. It will not wantonly attack a stranger, but evidently regards him with suspicion, and rejects all friendly advances. There are three varieties of the sheep-dog found in Great Britain, viz.—the Scottish Collie, standing only from 12 to 14 inches high, and regarded as the purest and most intelligent; the Southern Sheep-dog, of larger size, but with shorter fur, and having the tail often very short—a peculiarity which, according to Bell, "appears to be perpetuated from parents whose tails have been cut;" and the Drover's Dog or Cur, generally black and white in colour, and taller in its limbs than the others. It is employed in driving sheep and cattle to the city markets, and in the discharge of this duty shows intelligence quite equal to that of the other varieties; although in the treatment of the herds under its charge, it often displays a more savage disposition. The sheep-dogs of South America are so trained as to unite in themselves the duties of dog and shepherd. "When riding," says Darwin, "it is a common thing to meet a large flock of sheep, guarded by one or two

dogs, at the distance of some miles from any house or man." And on inquiry he found out the method by which this friendship between dog and sheep had been established. The dog when a puppy is removed from its mother, and is no longer allowed to associate with other dogs, or even with the children of the family. It is kept in the sheep pen, and suckled by a ewe. Generally also it is castrated and thus has little or no community of feeling with its kind. Brought up among the sheep it shows no desire to leave the flock, but assumes the position of leader. "It is amusing," says the above writer, "to observe, when approaching a flock, how the dog immediately advances barking, and the sheep all close in his rear as if round the oldest ram." It comes home daily for food, on receipt of which it immediately returns to the flock, and this it is often taught to bring home in the evening.

The Newfoundland and Great St Bernard or Alpine Dogs occupy an uncertain position, forming, according to some authors, a group by themselves, and being classed by others among the wolf-like dogs, although in their large and pendulous ears they differ widely from the typical forms already noticed.

The Newfoundland Dog is believed to have been brought to England from the island to which it owes its name, but probably owing to partial crossing, it differs somewhat from the original American breed, the latter being smaller in size, with the muzzle less blunted, and almost totally black in colour. In Newfoundland and Labrador these dogs are used as beasts of burden, drawing considerable loads of wood and provisions on sledges. The feet are partially webbed, and consequently they are unrivalled as water-dogs, and although their weakness of scent and comparative slowness of foot renders them useless to the hunter, yet in a country of fens and morasses, the sportsman finds them of the greatest service in rescuing birds that have fallen into the water; nor do they hesitate in their eagerness for retrieving to make their way through the roughest cover. The English variety of Newfoundland Dog is a noble creature, standing 30 inches high at the shoulders,

even in confinement such cases are altogether exceptional. This breed is supposed by some not to be indigenous to North America, but to have been introduced either on the first discovery of Newfoundland by the Norwegians about the year 1000, or on its re-discovery by Cabot in 1497. The Norwegians, according to Martin, have dogs closely resembling the Newfoundland breed, which are used in hunting bears and wolves, and which are armed with spiked collars in order to protect them from the wolves which seek to seize them by the throat. The Great St Bernard Dog of the present day is a powerful animal, as large as a mastiff, with close short hair and pendulous ears, and varying in colour, in one case being described as "sandy red or tawny" with black muzzle, in another as "more or less marked with grey, liver colour, and black clouds." Previous to 1820 there existed another breed of these dogs, closely allied in form and size to the Newfoundland, but in that year the greater portion of them died of an epidemic, which necessitated the introduction of the present variety. These dogs are kept by the monks of the Hospice of St Bernard, in their convent, situated on one of the most dangerous passes between Switzerland and Italy, near the top of the Great St Bernard, where they are trained to the work of rescuing travellers who, overtaken by the snow-storm, may have lost their way, or sunk benumbed by the cold. On such occasions these sagacious and powerful dogs set out from the convent in pairs, one bearing a flask of spirits attached to his neck, the other with a cloak. Should they come upon the baffled yet struggling traveller, they conduct him to the convent; but should he have succumbed and be covered by the snow, their keen scent detects his presence although buried several feet beneath the surface. By loud barking—and a young dog of this breed kept many years ago in the suburbs of Edinburgh was able to make itself heard a mile away—they apprise the monks of the need of succour, while with their feet they attempt to clear away the snow from the body. In this way these dogs are instrumental in saving many lives every year, although often at the sacrifice of their own; one dog which thus met its death bore a medal stating that it had been the means of saving twenty-two lives.

II. GREYHOUNDS.—Representations on Egyptian monuments prove the existence of the greyhound race of dogs at least 3000 years ago, and the silky-haired breeds existing in Egypt, Arabia, and Persia at the present day are probably the slightly modified descendants of those ancient forms. The numerous varieties of this race may be conveniently grouped into the wire-haired and smooth-haired breeds,—of the first of which the Irish Greyhound or Wolf-dog is an example. In former times this magnificent breed was employed in Ireland in hunting the wolf and the stag, but the extirpation of these beasts of chase led to the neglect and consequent degeneracy of the breed, and it has now become extinct in that country. It was probably introduced from the sister isle into Scotland, where its modified descendant, the Scottish Deerhound, in hunting the stag still bears testimony to the great strength and agility of its progenitor. The Old English Greyhound was only allowed to be kept by the nobles and princes, and the killing of it was, under the old game laws, a felony punishable by death. It was employed in coursing the red deer and fallow deer, and Queen Elizabeth is said to have witnessed, on one occasion, the pulling down of 16 bucks by greyhounds. These must have been much more powerful animals than the modern English breed, which, however, is regarded as the finest of the smooth-haired greyhounds. In speed and wind it is unrivalled, all other points having been sacrificed to these by breeders. It has thus almost lost the power of scent, and is the only dog that hunts by sight alone, hence probably the name *gaze-*

FIG. 2 —Newfoundland Dog

its hair waved or curly and of a black and white colour in nearly equal proportions, its tail massive and bushy and curled upwards at the extremity. Equally noble in disposition, it does not allow the annoyance of smaller dogs to disturb its serenity, while its patience with children is not readily exhausted. In defence of its master's property it will fly with bull-dog ferocity at any intruder, while it will battle with the waters to save him from drowning. Its services in the saving of life are well known. When kept in confinement its temper is more variable, and in a fit of irritation these dogs have been known to attack those for whom they have previously shown the greatest regard; but

hound formerly applied to it. According to Daniel, its speed on flat ground is little inferior to that of a racehorse,

FIG 3—Greyhound.

while on hilly ground it is probably superior to it. Every part of its body is suggestive of activity and speed—the long and pointed muzzle, the narrow head, thin neck, chest deep and flanks contracted, long slender legs, and the tail narrow and curved upwards. It is exceedingly docile, good-tempered, and affectionate. The colour varies in different breeds, and even in individuals of the same breed. Bell suggests that the greyhound may owe its name to the prevailing colour of the original stock; while others, with more probability, derive it from the ancient British *grech* or *greg*, a dog. The Italian greyhound is a small but exceedingly elegant and delicate breed, relegated in this country to the parlour as a ladies' pet. The Lurcher is supposed to be the result of a cross between the rough greyhound and the sheep-dog, having the sharp, pointed muzzle of the former, and owing its diminished height but greater stoutness to the latter. It resembles the sheep-dog still more in its great intelligence, and in devotion to its master. That master is usually the poacher, and in his illegal pursuit of game, the keenness of scent, the cunning, and the absolute silence of this dog render it the most suitable of all for such nocturnal work. It waylays the rabbit returning to its burrow, its cunning circumvents the hare where its speed would not avail, and it has strength sufficient to pull down the fallow deer. According to Colonel Smith these dogs sometimes run wild when their owners are captured and imprisoned, and when thus catering for themselves they have been regularly hunted with hounds.

III. SPANIELS.—The spaniels are characterized by large pendulous ears, long silky hair often curled and shaggy, and acute scent. In cerebral development, and, consequently in intelligence, they are probably superior to all other dogs, while they are unrivalled in docility and in devotion to man's service. They include the Common Spaniel, the Water Dog, and the Setter, besides numerous fancy varieties, as King Charles's Spaniel, the Blenheim Spaniel, and the Maltese Dog. The Spaniel is the favourite of the sportsman, entering more than any other dog into his master's feelings, and seeming to enjoy the sport for its own sake. It is elegant in form, with remarkably long ears, and beautifully waved hair, usually of a red and white colour. It takes readily to the water, and has been known to exhibit a remarkable propensity, as well as great dexterity, in fish-catching. The Water Dog is larger than the spaniel, and is covered with abundant curly hair. Its colour is generally a mixture of black and white. From its aquatic habits it is of great service to the water-fowl sportsman as a retriever. It is readily taught to fetch and carry, and the sagacity which it shows in finding any article it has once seen, but which has afterwards been lost or

purposely concealed, is truly remarkable. The Setter is also a favourite with sportsmen, its habit of crouching when

FIG 4—Setter

it has scented game rendering it specially serviceable. This habit, like that of pointing, is probably, as Darwin suggests, "morely the exaggerated pause of an animal about to spring on its prey." It is generally white in colour, with large liver-coloured spots.

IV. HOUNDS.—Hounds are those dogs with long pendulous ears, close hair, and long deep muzzle which hunt by scent. They include the Bloodhound, Staghound, Foxhound, Harrier or Beagle, and Pointer.

The Bloodhound, regarded by many as the original stock from which all the other varieties of British hounds have been derived, is now rarely to be met with in entire purity. Its distinguishing features are long, smooth, and pendulous ears, from 8 to 9 inches in length, full muzzle, broad breast, muscular limbs, and a deep sonorous voice. The prevailing colour is a reddish tan, darkening towards the upper part, and often varied with large black spots. It stands about 28 inches high. The bloodhound is remarkable for the acuteness of its scent, its discrimination in keeping to the particular scent on which it is first laid, and the intelligence and pertinacity with which it pursues its object to a successful issue. These qualities have been taken advantage of not only in the chase, but also in pursuit of felons and fugitives of every kind. According to Strabo, these dogs were used in an attack upon the Gauls. In the clan feuds of the Scottish Highlands, and in the frequent wars between England and Scotland, they were regularly employed in tracking fugitive warriors, and were thus employed, according to early chroniclers, in pursuit of Wallace and Bruce. The former is said to have put the Sleuth-hound, as it was called, off the scent by killing a suspected follower, on whose corpse the hound stood,

"Nor farther moved fr' time she found the blood"

For a similar purpose captives were often killed. Bruce is said to have baffled his dogged pursuer as effectually, though less cruelly, by wading some distance down a stream, and then ascending a tree by a branch which overhung the water, and thus breaking the scent. In the histories of border feuds these dogs constantly appear as employed in the pursuit of enemies, and the renown of the warrior was great who,

"By wily turns and desperate bounds,
Had baffled Percy's best bloodhounds"

In suppressing the Irish rebellion in the time of Queen Elizabeth, the earl of Essex had, it is said, 800 of these animals accompanying the army, while in later times they

became the terror of deer-stealers, and for this purpose were kept by the earls of Buccleuch so late as the 18th century, and even at the present time their remarkable power of scent is occasionally employed with success in the detection of murder. The Cuban Bloodhound is of Spanish descent, and differs considerably in form from the English variety, having small, though pendulous ears, with the nose more pointed, and with a more ferocious appearance. Its employment in the capture of runaway slaves, and in the cruelties connected with the suppression of negro insurrections, has brought the animal into the evil repute which more properly belongs to the inhuman masters, who thus prostituted the courage, sagacity, and pertinacity of this noble dog to such revolting purposes.

The Staghound has been generally regarded as the result of a cross between the slow-paced old southern hound

FIG 5 — Staghound.

and the fleeter foxhound; but it has been objected that the breed was known in England long before the foxhound was made use of, and indeed before there was an animal at all resembling the one which is now known by that term, and those who maintain this view regard the staghound as a bloodhound crossed with some lighter dog, as a greyhound or a lurcher. However produced, it is a majestic

III., who was himself ardently attached to the sport of stag-hunting, packs of these dogs were maintained in several parts of the country, but since the death of that monarch this form of hunting has declined, and the total extinction of these dogs at no distant date seems probable. The Foxhound is the hunting-dog upon which the breeder has bestowed the greatest pains, and, according to Bell (*British Quadrupeds*), his efforts have been rewarded "by the attainment of the highest possible degree of excellence in the union of fine scent, fleetness, strength, perseverance, and temper." It stands usually from 20 to 22 inches high at the shoulders, and is of a white colour, marked with large clouds of black and tan. Its speed is such that a foxhound has been known to get over 4 miles in 7 minutes, while its endurance has been shown in such cases as the 10 hours' continuous run performed by the duke of Richmond's hounds in 1738 before killing the fox, during which many of the sportsmen tired three horses, and several of the latter died during the chase. The Harrier is smaller

FIG 7 — Harrier.

than the foxhound, not exceeding 18 inches in height at the shoulders, and is exclusively used, as the name shows, in hunting the hare. Of late years it has been greatly improved, so as to be almost literally a foxhound in minia-

FIG. 6.—Foxhound.

dog, of great strength and considerable swiftness, besides possessing in common with the bloodhound, and with it alone, the property of unerringly tracing the scent it is first laid upon among a hundred others. In the reign of George

FIG 8 — Beagle.

ture. According to Beckford, to whom much of the improvement in the breed is owing, "harriers, to be good, like all other hounds, must be kept to their own game. If you run fox with them you spoil them; hounds cannot be

perfect unless used to one scent and one style of hunting." A still smaller hound is the Beagle, from 12 to 14 inches high, the most diminutive of the hunting dogs. It was formerly a great favourite, being used in hunting the hare, but in this it has been almost wholly superseded by the harrier. It is much slower than the foxhound or harrier, but in spite of this its exquisite scent and its perseverance seldom fail to secure for it the object of its chase, although it may be after a leisurely hunt of 3 or 4 hours. The voice of the beagle is highly musical, and on this account a certain number of them were formerly added to each pack of hounds as a band now is to a regiment of soldiers. Diminutive packs, from 9 to 10 inches high, have been kept, and O'Connell used to beguile his winter leisure with a dozen of these tiny favourites. The Pointer is related to the hounds, and is supposed to be derived from an old Spanish breed. It is a beautiful, smooth-haired dog, coloured somewhat like a foxhound, active in its movement, and patient of fatigue. It owes its name to its habit of standing fixed at the scent of game, and this, like the crouching of the setter, whether due to long-continued training alone, or to the modification and exaggeration by man of the instinctive start of surprise common to all dogs, when first aware of their prey, is now inherited, the puppy pointing before his training has begun. The strength of this pointing propensity was never more signally shown than in the case, told by Daniel, of two pointers which stood immovable as statues during the hour and a quarter occupied in sketching them. The Dalmatian Dog is a remarkably handsome breed, apparently intermediate between hound and pointer. It is of a white colour, thickly

FIG 9.—Dalmatian Dog

marked with rounded black spots, but it is not sufficiently keen scented or sagacious to be of use in hunting. It has accordingly been relegated to the stables, where it receives the training necessary to a coach-dog. It is known in France as the *Brague de Bengale*, and is supposed to be an Indian variety.

V MASTIFFS—The Mastiff race of dogs is characterized by extreme shortness and breadth of muzzle, enormous strength of jaws, and general robustness of form. It includes the Mastiff, the Bull-dog, and the Pug.

The Mastiff equals in courage, while in strength, intelligence, and mildness of disposition it excels, its nearly the bull-dog. It is commonly supposed to have been the breed of large dogs abundant in Britain during Roman times, which were exported in large numbers to Rome for the purpose of fighting in the Amphitheatre, although Colonel Smith believes that these early British dogs were only bull-dogs of a larger size than the present breed, and that the mastiff was introduced into Britain from the cold regions of Central Asia. It is a large dog, standing 30

inches high at the shoulders, with thick muzzle, pendulous lips, and heavy expression, its ears small and drooping, and the tail well developed. It is usually of a buff colour, with ears and muzzle darker. Although fierce in combat,

FIG 10.—Mastiff.

it does not attack without considerable provocation, and it bears the teasings of children with the greatest good nature. When in former times it entered into combat with wild animals, it has been known to engage a bear, a leopard, and a lion, and pull each of them down in succession. At the present time the breed is rarely met with pure, and is chiefly useful as a watch-dog, its sagacity and fidelity in this capacity being well known. While he shows great attachment to man when made his companion, the temper of the mastiff becomes soured by confinement, and he is then dangerous to strangers. The Thibet Mastiff is larger than the English breed, and its countenance is still heavier. It is the watch-dog of the tribes inhabiting Thibet and the Central Asian table-land, to whom it is strongly attached, although exceedingly savage towards strangers. There is a huge mastiff figured on an Assyrian sculpture, 640 B.C., and Sir H. Rawlinson states that similar dogs are still imported into that country. The Bull-dog is the least sagacious, as well as the most ferocious and obstinate, of the dog tribe. It is smaller than the mastiff, but is strongly built. Its broad, thick head, the projection of the lower jaw beyond the upper disclosing the incisor teeth, the sudden rise of the head from the face, and the scowling expression of the eyes, combine to make the countenance of the bull-dog terrible. Bell points out, in his *History of British Quadrupeds*, the resemblance in the deep chest, the narrow loins, muscular limbs, and stiff tapering tail of the bull-dog to the elegant form of the greyhound. The chief difference appears in the muzzle, a variation which may have suddenly arisen in a single individual, and been perpetuated in its progeny. The ears of the bull-dog are short and semi-erect, and the nostrils distended; the colour varies, being brindled in some, and black and white in others. It is essentially a fighting-dog, and was formerly bred for the brutal sport of bull-baiting, in which its terrible obstinacy usually gained for it the victory. It differs from other dogs in giving no warning of its attack by preliminary barking, and when once it has fixed its teeth into the object of attack, no amount of torture will cause it to relax its hold. Colonel Smith states that he has seen one "pinning down an American bison and holding his nose down till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled;" and there is an instance on record of its returning to the attack on a bull

after each of its feet had been cut off in succession. The intelligence of this breed has been but slightly developed, and it exhibits little of that attachment to man which characterises other dogs, although it may be said to show a sullen sort of fondness for its master. The Spanish Bull-dog is larger and more powerful than the English breed. The Pug-dog, which in form might be described as a miniature bull-dog, is probably a monstrous variety, rather than a degenerate form, of the bull-dog. It is, however, wholly unlike the latter in disposition, being timid and good-tempered, and is kept only as a pet, for which its dulness of intellect scarcely fits it.

VI. TERRIERS.—These include the numerous varieties of Terrier dog, and the Turnspit. The Terrier is a small but very distinct breed, and is probably one of the oldest dogs

FIG. 11.—Terrier.

found in Great Britain. Three distinct varieties exist in this country, viz., the English Terrier, smooth and graceful in form, with sharp muzzle and erect ears, compact body, strong though slender limbs, and tail carried aloft and somewhat curved—the colour being black, with the belly and extremities usually tan, but sometimes white; the Scotch Terrier, differing from the former in the shortness of the muzzle and limbs, and in the rough wiry character of the hair, which is usually of a dirty white colour; and the Skye Terrier, distinguished by the length and coarseness of its hair, the extreme shortness of its limbs, and the great length of its body. It is of a light brown colour. The Terrier in all its varieties is an exceedingly bold, active, and intelligent dog. It was formerly a regular accompaniment to every pack of hounds, for the purpose of unearthing the fox, and to its eagerness in taking the earth it owes its name. Terriers are now chiefly employed in the destruction of otters, badgers, weasels, and rats, a form of sport into which they enter with the greatest ardour, and in which they show the most remarkable dexterity, a celebrated Terrier having been known to kill 100 rats, collected in one room, in 7 minutes. The Bull-terrier is a cross between this breed and the bull-dog, and is one of the most savage and obstinate of its kind. It was the breed chiefly used in the brutal sports of badger-baiting and dog-fighting, now almost unknown in England. The Turnspit, a monstrous form of dog, is not confined to any single breed. It is figured on the ancient monuments of Egypt, and occurs among the pariah dogs of India and of Paraguay. In Britain, where they seem to be derived from hounds or terriers, there are smooth and rough turnspits, a name which they owe to their having been formerly employed in turning kitchen spits by working inside a wheel, which

when once set in motion forced the dog to continue running. At Caerleon in Monmouthshire, a few years ago, a dog of this kind might have been seen thus employed in the inn kitchen. The turnspit is characterized by great length of body and extreme shortness of limb, the latter being generally crooked.

(J. GL.)

DOGE, a modified form of the ordinary Italian *duce*, from the Latin *dux*, a leader or duke, employed to designate the chief magistrate in the republics of Genoa and Venice. In both cities the office underwent from time to time a variety of transformations, for details on which the larger histories of the republics must be consulted.

In Venice the doge was originally chosen by universal suffrage, held office for life, and was regarded as the civil, military, and ecclesiastical chief. His duties and prerogatives were not defined with much precision, and the limits of his ability and ambition were practically the limits of his power. In 755 his independence was diminished by the appointment of two assistants or *duumvirs*; but this institution was again allowed to fall into the background, and the doge acquired more and more of irresponsible authority, while at the same time the office was usually committed to a member of one or other of the more powerful families. This tendency towards a hereditary despotism was checked in 1033 by Flabeno's law, which reinstituted the *duumvirate*, and declared distinctly that no doge had the right of associating any member of his family with himself in the government, or of transmitting his office on his decease. In 1172 a still more important change was introduced; not only was the *duumvirate* replaced by a body of six councillors, but universal suffrage was abolished, and the election of the doge intrusted to a committee of twelve persons, elaborately selected from the members of the great council. On the death of Ziani II. in 1229, two commissions were appointed, which obtained a permanent place in the constitution, and gave emphatic testimony to the fact that the doge was merely the highest servant of the community; the first consisted of five *Concettori della promissione ducale*, whose duty was to consider if any change ought to be made in the oath of investiture administered to the doge; the second was a board of three *inquisitori sul doge*, intrusted with the curious task of examining and passing judgment on the acts of the deceased magistrate, whose estates might be mulcted in accordance with their decision. To minimize as far as possible the influence of individual families, the election of the doge was in 1268 effected by a curiously complex machinery, which remained, with some modifications, till the close of the republic; thirty members of the great council, elected by ballot, selected nine members, who in their turn chose forty; of these forty twelve taken by lot chose twenty-five; the twenty-five were next reduced to nine; the nine elected forty-five; the forty-five were reduced to eleven; and the eleven chose the final forty-one in whose hands lay the actual election of the doge. In proportion to the development attained by the oligarchical element in the constitution, the more important functions of the office were assigned to other officials or to administrative boards, and he who had once been really the pilot of the ship became little more than an animated figure-head, properly draped and garnished. On state occasions he was still attended by all the ceremonial observances of former times: his robe was still purple, the horns of his beretta were still exalted, the sword, the tapers, and the trumpets were borne before him, his leaden seal was affixed to public documents, and the ring was still dropped yearly from his hand in symbolic espousal of Venice and the sea. But he was under the strictest surveillance, had to wait for the presence of other officials in order to open the despatches from foreign powers, was forbidden to leave the city, could not legally

be possessed of property in a foreign land, or contract a foreign alliance for any of his children, and was moreover liable to the infliction of a fine for any trespass he might commit. The office was maintained, however, till the last days of the republic, and from time to time was held by men who knew how to make it something more than such an empty simulacrum. (See Cecchetti, *Il Doge di Venezia*, 1864.)

In Genoa the institution of the doge dates from 1339, and at first he was elected without any restriction by popular suffrage, and held office for life; but after the reform effected by Andrea Doria in 1528, the term was reduced to two years, plebeians were declared ineligible, and the appointment was intrusted to the members of the great and the little councils, who were bound, however, to employ, in proof of impartiality, nearly as complex a machinery as that of the later Venetians.

DOG-FISH, a name applied to several species of the smaller sharks, and given in common with such names as hound and beagle, owing to the habit these fishes have of pursuing or hunting their prey in packs. The Small-spotted Dog-fish or Rough Hound (*Scyllium canicula*) and the Large-spotted or Nurse Hound (*Scyllium catulus*) are also known as ground-sharks. They keep near the sea bottom, feeding chiefly on the smaller fishes and Crustacea, and causing great annoyance to the fishermen by the readiness with which they take bait. They differ from the majority of sharks, and resemble the rays in being ovoviviparous. Their young are brought forth inclosed in semi-transparent horny cases, known on the British coasts as *mermaids' purses*, and these have tendril-like prolongations from each of the four corners, by means of which they are moored to sea-weed or some other fixed object near the shore, until the young dog-fish is ready to make its exit. The larger of these species attains a length of 4 to 5 feet, the smaller rarely more than 30 inches. The Picked Dog-fish (*Acanthias vulgaris*) is pre-eminently the dog-fish. It is the smallest and most abundant of the British sharks, and occurs in the temperate seas of both northern and southern hemispheres. It rarely attains a length of two feet, the female, as in most sharks, being larger than the male. The body is round and tapering, the snout projects, and the mouth is placed far under. There are two dorsal fins, each of which is armed on its anterior edge with a sharp and slightly curved spine, hence its name "picked." In order to strike with these spines the fish first bends itself into a bow, and by a quick motion causes them to spring asunder in opposite directions, seldom failing thus to strike the object aimed at. The dog-fish is exceedingly prolific, the female, according to Couch, producing young almost daily for 9 or 10 months in the year. These are not contained in egg-cases, as in the ground-sharks, but are produced alive. It is gregarious, and is abundant at all seasons everywhere on the British coasts. In 1858 an enormous scull of dog-fish, many square miles in extent, appeared in the north of Scotland, when, says Couch, "they were to be found floating in myriads on the surface of every harbour." They are the special enemies of the fisherman, injuring his nets, removing the hooks from his lines, and spoiling his fish for the market by biting pieces out of them as they hang on his lines. Still greater injury is caused to the fisheries in the wholesale destruction of small fishes by this predacious species. They are, however, eaten, both fresh and salted, by fishermen, especially on the west coast of England.

DOGMATIC (Ger. *Dogmatik*) is the name usually given by modern writers, especially on the Continent, to that branch of theological study which treats of the doctrines of Christianity. As there are considerable varieties in the conception and treatment of dogmatic by different

theologians, churches, and schools, it will be best to give an historical account of the origin and usage of the term.

The Greek word *δόγμα*, from which it is derived, has two meanings, one of which is found in the LXX. and New Testament, while the other is given to it by some of the ancient philosophical writers. According to the former sense, it denotes a decree or ordinance, i.e., a precept as to conduct or observance, proceeding from human or divine authority (Luke ii. 1, Acts xvi. 4, Eph. ii. 15). This is the only meaning in which the word is used in Scripture; but by Plato, Cicero, Seneca, and others it is employed to denote the doctrines of the philosophers, i.e., principles or theories formulated or accepted in the different schools. In this latter sense the word was used by the early Christian writers, as describing indifferently heathen, Christian, or heretical doctrines, as the case might be; although sometimes, when the word was applied to the Christian verities, it may have acquired, from the other use of it, a certain tinge of the idea of authority belonging to the doctrines of the faith. As early as Cyril of Jerusalem (*Catech.* iv. 2) the distinction was made between the doctrinal and the moral elements of Christianity; and the term *δόγμα* was appropriated to the former, the latter being called *ἠθικὸν μέρος*.

But it was not till long afterwards that the adjective, "dogmatic," was used to distinguish a particular branch of theological study; for in early times the need of subdivision in the scientific study of Christian truth was not felt, and the name theology was sufficient to describe all works dealing with that subject in any way. The progress of thought and inquiry in the history of the Church has, however, made it possible and necessary to treat the truths of Christianity in various different ways, from distinct points of view; and hence different kinds and departments of theology have come to be distinguished. In the 17th century the divines who wrote systems of theology gave different titles to their works, indicating the special manner of their treatment; e.g., Mastricht, *Theologia Theoretico-Practica*; F. Turretin, *Theol. Elenctica*; Marekian, *Compendium Theol. Didactico-Elencticum*; Quenstedt, *Theol. Didactico-Polemica*; Baier, *Theol. Positiva*.

The title *Theologia Dogmatica* was first adopted by John Francis Budeus, a Lutheran divine, in 1724. This terminology was followed by J. H. Michaelis, Seiler, and others, and from it the word *Dogmatik* as a substantive came into common use in Germany. In England and America, in so far as any specific designation of the general term theology or divinity has been thought necessary, the title "systematic" has been until recently more current than "dogmatic." As, however, the division and mutual relations of the various theological studies have been very thoroughly discussed in recent times, especially by German theologians, and as the name "dogmatic" has been used by them to denote one principal department of these, there is good reason for its adoption by English writers. Some prefer the form "dogmatics," after the analogy of "mathematics," "physics," &c.; but this seems awkward and needless.

But there is among the best authorities on the subject Nature as a considerable difference as to the proper nature and place in the theological sciences of dogmatic. There are two distinct conceptions of its nature, each supported by eminent names, according to one of which it is an historical, and according to the other a philosophical study. The difference may be said to turn on what substantive is to be understood along with the adjective *dogmatica*. If, according to what was undoubtedly the older usage, we supply *theologia*, then the name "dogmatic theology" would denote the study of God and divine things in a doctrinal manner, or so as to exhibit its results in a series of doctrines. The epithet dogmatic would indicate, not the subject of the

study, but the manner of it; and thus it would fall under the general head of philosophical or systematic theology. This was the older view, and is held in modern times by Julius Müller¹ and Hagenbach.² If, however, it be held, as is held by many moderns, that *scientia* is the substantive understood with *dogmatica*, then the term means the science of doctrines, and has for its object not the Christian realities themselves, but the doctrines that have been formed about them; and as such it must be an historical science. This is the view adopted by Schleiermacher,³ Rothe,⁴ Martensen, Oosterzee, and others; though the particular form and development of the general idea differs according to the different views of these writers as to the nature and formation of doctrines. There can be no doubt that an historical and critical study of the doctrines that have been held in the Christian Church or its several branches is a legitimate, and in its own place, not unimportant pursuit, and whether such study should be called dogmatic is a mere question of nomenclature and usage. But it can be as little doubted that this study does not occupy that central place in the theological sciences that has usually been assigned to dogmatic, and is not fitted to supersede that direct study of Christian truth that has long borne the name of theology by way of eminence. Hence some of those who make dogmatic a merely historical science hold that there is required besides that a science of speculative theology, dealing directly in a philosophical way with the objects of Christian faith; while Al. Schweizer thinks that dogmatic, as a science of dogmas, should be discarded as essentially un-Protestant, and that in its stead should be placed what he calls *Glaubenslehre*. It is clear that we must have some name to express the former conception of dogmatic, and there is no other name so convenient or so generally used as this. On the other hand, all are not agreed on the necessity and importance of a separate science of dogmatic in the historical conception of it; and it is not easy to draw a line of distinction between it and symbolical theology, or the study of the creeds and confessions of the different churches. It seems therefore convenient to regard dogmatic as a branch, not of historical, but of systematic or philosophical theology. In this view it is the study which endeavours to understand the facts and truths of Christianity in their true nature, causes, and mutual relations. This study presupposes the reality of Christianity, as the divinely-revealed and perfect religion, and on that basis proceeds to investigate what is contained in it with a view to its scientific comprehension. It is thus distinct from, and posterior in the order of nature to, apologetic, which is another branch of philosophical theology, and has for its function the scientific exhibition of the grounds of religion in general and of Christianity in particular. Apologetic has accomplished its task, when it has established and vindicated against attacks that Christianity is truly divine, and the final form of revealed religion. Dogmatic accepts this conclusion as its starting-point, and proceeds to inquire what are the facts that constitute Christianity, how they are to be accounted for, and what is their mutual relation. In this process it must needs generalize and determine the conceptions suggested by the facts by means of definitions, and combine these in the form of definite propositions, which are what are called doctrines, and which are again arranged and framed into a system of doctrine. Doctrines, as usually understood, have reference simply to truths to be believed; and they correspond to the

laws of nature discovered and formulated by science. The leading theological doctrines are thus attempts to explain in a scientific way certain religious phenomena that belong to Christianity. In dealing simply with facts as distinct from laws, with what is as distinct from what ought to be, dogmatic is distinguished from ethic or moral theology, which is another branch of the same general division of theological studies. For Christianity is more than a revelation of truths; it is also a body of practical precepts; and the meaning, principles, and application of these afford a wide and important field of inquiry. There have indeed been some weighty and earnest protests raised against the separation of ethic from dogmatic;⁵ and there is a certain advantage in the two subjects being treated together, as they usually were by the older theologians, under the heads of *fides* and *observantia*, or the like. Christian doctrine and Christian duty can never be separated in reality without the loss of the life of both, and this should be kept in mind in their discussion. But each of these subjects has grown to such an extent that convenience almost necessitates the plan that has become usual in academic teaching and books, of giving them a separate treatment, and restricting the province of dogmatic to the truths of Christianity that are objects of belief, as distinct from its precepts as matters of duty. Polemic and irenic are branches of theology that have also a very close connection with dogmatic,—the former having for its object the exclusion from the system of Christian doctrine of ideas and opinions that are essentially alien to its principles, and the latter the harmonizing or bringing into a relation of mutual toleration views of doctrine which differ in some particulars, and yet are neither of them essentially un-Christian or anti-Christian. These may be regarded as appendices to dogmatic, being the application of its principles to the varieties of belief that exist among Christians.

There are two other studies, of recent origin, whose relation to dogmatic should be defined, as they have sometimes been thought capable of superseding it—biblical theology and the science of religion. The former of these is a development of Scripture exegesis, and seeks, in dealing with the sacred writings, not merely to understand their direct meaning, but to enter into the conceptions of their several writers on the whole subject of religious truth,—to find out from their writings the theology of Paul, or Peter, or John, just as the historian of doctrine endeavours to exhibit the theology of Athanasius, Augustine, or Luther. Then, taking a wider view, it groups all the inspired writers of a period together, and seeks to present the theology of the New Testament, or of the Old, just as one may do with the Nicene or the Reformation theology. This is a most interesting and useful study, and much valuable work has been done by it; but it is clearly an historical study, and as such belongs to a different department from dogmatic, if that is placed in philosophical theology. It furnishes important materials for dogmatic, and gives us the power of using Scripture in a more historical way than would be possible without it, but as it cannot be assumed that any one inspired man, or any one age of the history of revelation, saw the entire system of divine truth as it is in itself, even the most perfect results of biblical theology will only be materials for dogmatic, not dogmatic itself.

The science of religion, again, investigates the various forms of religion among mankind, and by the comparative study of these seeks to discover their origin and mutual relations. It is probably too soon yet to judge what the results of this young and promising study may be, but they should certainly not be despised by the Christian theologian. They may have an important bearing on apologetic, and

⁵ By Schleiermacher, Nitzsch, and Beck.

through that may possibly affect the form, and even in some points the substance, of dogmatic. But the science of religion is itself entirely distinct from dogmatic; for it takes as its subject all religious beliefs, and treats them simply as psychological phenomena, without considering, in the first instance, whether any, or which of them, have objective reality, whereas dogmatic is a science of faith, and proceeds upon the assumption of the truth of Christianity and the Christian view of the universe.

The possibility and the need of such a science as dogmatic rest upon the specific nature of Christianity as the perfect form of a divinely given religion. Religion in general is a relation between man and God, and it may be either natural or supernatural. In the former case, it is the relation of man to the divine Being as manifested in the world, and as long as men have no other knowledge of God than this, their religion is apt to degenerate into unworthy ideas and practices; and thus natural religion, in the present state of mankind, tends to become false religion, as is seen in the various forms of heathenism. But the fundamental assumption of Christianity is, that God has, in addition to the manifestation of Himself that nature affords, also come forth in history by a divine work, leading men from the errors of false religion to the true knowledge and pure service of Himself. This work of grace has always dealt with men in a way suitable to their nature as intelligent beings, and hence has included a discovery of truth that they could not have found out for themselves, which is the idea of revelation. But while supernatural religion must include revelation as an essential part of it, this is not the whole, nor even the most vital and important element in it. The divine religion is essentially the establishment of a right relation between man and God, fellowship between earth and heaven, and it only includes the communication of new truths, because that fellowship must be an intelligent one, brought about in an intelligent way. This work has also been a gradual one, and has had its several successive stages. Scripture represents the call of Abraham, the exodus of Israel from Egypt and covenant of Sinai, the establishment of the kingship and temple worship in Israel, and the messages of the prophets, as so many stages in the history and progress of religion; and the coming of Christ and the foundation of the Christian church is the final stage of its development. Now, like all the earlier stages, Christianity, while it implies the communication of new truth, is essentially a fact or work of history—the establishment of the perfect fellowship of man with God, which is that mediated by Jesus Christ, and the reconciliation effected by His death. It is this conception of Christianity that makes possible a scientific exhibition of it in the form of a system of doctrines as distinct from the simple interpretation of its records. If, according to a notion that early entered and long pervaded the church, Christianity is merely a new law, a revelation of hitherto unknown truths to be believed, precepts to be obeyed, and promises to be hoped for, then the theologian has nothing to do but to expound the revelation, ascertaining the meaning of its several statements, and classifying them according to their subjects or character. Any attempt to gain a scientific knowledge of the realities with which these statements have to do must proceed on general philosophical principles, and not on a specifically Christian foundation. Now this conception of Christianity was the prevailing one up to the time of the Reformation, and consequently the pre-Reformation theology, and much of later theology too, consists either of the mere exposition of certain *dicta* of authority, biblical or ecclesiastical, or of purely logical ratiocination, applying to these the principles of the philosophy current at the time. Only when the Reformers brought out the principle that Christianity is not

a new law, but a work of God's grace, reconciling men to himself in Christ, and that as such it must come before theology, was the construction of a system of Christian doctrine on right principles possible. On the basis of the direct experience of reconciliation to God through Jesus Christ, it is possible to raise and investigate the question—What is the nature, the cause, the various parts and relations, of this great work, this new relation into which I as a believer am brought to God? Now this is just the question that dogmatic seeks to answer; for it is, as before said, a scientific treatment of Christianity as the perfect form of supernatural religion. On this view the existence of dogmatic is not due to a primary, but to a secondary necessity of Christian life. The primary necessity for the Christian is a fellowship with God, including a sense of His favour, of His guidance in practical life, and protection against all hostile influence. To this religious fellowship it is not necessary that a complete system of divine truth be known or believed; according to the Pauline and Protestant doctrine of salvation by grace through faith, it is secured at once by the direct exercise of trust in Christ; and there must be this before there can be any right understanding of the truths contained and implied in Christianity. But there is a secondary need and impulse that forms a motive to dogmatic,—the desire of knowing as much as possible of the way in which we have been brought into that relation to God which is designated a state of grace or salvation. Christ and His apostles fully recognize the importance of knowledge, understanding, wisdom; while they teach that the only true knowledge of divine things must be preceded by direct experience of them, through faith in Christ. They speak wisdom among them that are perfect, though it is a heavenly wisdom, that needs spiritual enlightenment to know; and they exhort their converts to strive to be perfect or mature Christians, not children but men in understanding,—to add to their faith knowledge, and to grow in it. It is this craving for understanding of their new relation to God, which forms, though not the first, yet an important secondary necessity of healthy religious life, that affords the motive for the construction of theology in general, and of dogmatic in particular. Some amount of such knowledge seems to be indispensable to qualify one for teaching others; and so, if the church or Christian community is to exercise the function of teaching, there must be, beyond the faith that is the primary and essential quality of true Christians, the higher stage of Christian progress that is attained by those who add to their faith knowledge. Theology is thus not essential to the bare existence of the church; yet it is the natural and necessary form and means of her development in one department of her functions, the intellectual; just as in the department of practical morality a system of ecclesiastical discipline is an indispensable development, and in that of social devotion, ordinances of worship. Every living and thriving branch of the church of Christ must, in proportion to its health and vigour, cultivate scientific theology, as well as earnest conscientious discipline and warm spiritual devotion.

This motive prompts equally to all the branches of theological study—exegetical, historical, practical, as well as systematic or philosophical; but that which is designated dogmatic, as falling under the last head, may well be esteemed the highest of them all, and that which is most to be desired, if only it can be attained. As, however, some have doubted whether such a science is possible, we must not take this for granted, but indicate the grounds on which we believe it is. Now, if a scientific knowledge of any subject is impossible, this must be either because we do not possess materials enough to give us a thorough

knowledge of it, or because we have no means of reducing these materials to their true and natural order. If there are sufficient materials of knowledge about Christianity, and a method by which these may be reduced to a system, the conditions of a scientific dogmatic may be said to exist.

sources. The sources of dogmatic have been variously enumerated by different branches of the church and schools of thought, and the determination of the genuine ones involves the most important issues as to the whole character of the system. We may begin with the lowest and most universally accepted, and then proceed to those in regard to which there is more difference of opinion, and which determine the peculiarities of the dogmatic of different sects or churches. First, then, we may place the testimony of nature to God, which is admitted by nearly all theists to be real and valuable, so far as it goes, and which is clearly recognized in Scripture.¹ The Socinians in the 16th and 17th centuries denied the possibility of any knowledge of God without revelation; but this position, which was zealously controverted by the orthodox, has been given up by those who are the nearest modern representatives of the Socinians, and may be said to be held now only by those who would deny all knowledge of God whatever. This natural knowledge of God has sometimes been separated from properly Christian dogmatic, and relegated for separate treatment under the title of natural theology; but since most of the truths reached by it are also expressly taught in Scripture, it seems impossible to exclude from their consideration in the Christian system the prior light that nature throws on them. Hence the most orthodox divines admit that reason has as one of its functions in theology that of establishing or confirming some of its doctrines, which are therefore distinguished by many, especially of the Lutherans, as *articuli mixti*, being supported by reason and revelation together, from the *articuli puri*, which are known by revelation alone. This source of theological knowledge includes the manifestations of the being and character of God, and the nature and destiny of man in the phenomena of the external world, and also in the intellect, conscience, and religious affections of man. The importance of it arises from the fact that this natural knowledge of God alone connects the doctrines of revelation with the actual realities of consciousness and experience, and gives to the whole of theology a basis in ascertainable and verifiable fact. Unless we know, on grounds as legitimate as those of any secular science, that God is, and that He is true and good, we cannot rationally receive any revelation from Him, and our whole dogmatic would be a mere castle in the air.

lation
brst. But most Christians, while recognizing the reality and importance of the manifestation of God in nature, consider that this alone is inadequate, in the present condition of mankind, to bring us into that relation to Him which is the true and perfect religion; and all but those who deny the supernatural entirely believe that God has made a special revelation of himself in Christ. The person of Jesus of Nazareth is for all such the centre of God's saving discovery of himself and of His will to sinners of mankind; in His life and death we have an image of the character of God, and in His teaching, statements of religious truth that are of primary authority. On this account it may be truly said that the person and teaching of Christ is the fountain-head of revealed theology.² It would be quite possible to maintain that this is the only source of theological knowledge beyond the teaching of nature; but nearly all who entertain such views of Christ also believe that we have in the writings of His disciples an authoritative record of

His words and deeds, and a divinely-taught explanation of their meaning. Hence the Scriptures, at least of the New Testament, are recognized as themselves a direct source of dogmatic material. Some have limited this recognition of an inspired book to the New Testament, as Schleiermacher; but this position virtually rests on the idea that Christ himself is really the only supernatural source of religious truth, and that the New Testament Scriptures are not a real communication from God, but only an authentic human record of the revelation He has made of Himself in Christ. When the notion of a truly divine and authoritative Scripture is really admitted, it is impossible, in view of the use made of the Old Testament in the New, to deny the authority of these earlier Scriptures. The coming of Christ was not a sudden isolated appearance, unprepared for and alone, like a lightning-flash in a dark night; it was rather like the rising of the sun after a long and gradually lightening twilight. The way was prepared for Him by a series of historical revelations recorded in the sacred books of the Jewish people, which have from the days of the apostles onwards been regarded as divine by the Christian church. It is this continuous line of revelation, from the beginning onwards, that gives Christianity its universality in point of time, as the perfect form of the true religion that has always in some shape or other existed in the world. On this view, the Scriptures of the Old and New Testaments, as testifying of Christ, are the more immediate source of dogmatic materials; and this is the fundamental Protestant position.

The Church of Rome goes further, and maintains, not only that the Divine Spirit has inspired the writers of Scripture to convey to us an authoritative record of God's revelation in Christ, but also that the Spirit so dwells in the church as to enable her to develop that revelation, supplementing it by tradition, authenticating it by her authority, and interpreting it by decision on controverted points. Hence, for the Romanist, tradition, decrees of councils and of popes, opinions of fathers and doctors of the church, are equally with Scripture authoritative sources of doctrine. In this, however, Protestants hold that they err as much in the way of excess, as Rationalists, who deny the authority of the Bible, err in the way of defect. These Protestants, however, who have taken the most profound and spiritual view of the subject, have been ready to allow that there is provision made in Christianity for what Romanists seek to attain by the authority of the church. They admit that something more is needed than unaided human reason for the right interpretation and application of the word of God; but they find this, not in an infallible church, but in the work of the Divine Spirit, enlightening the mind of believers in and with the word (*testimonium* the *Spiritus Sancti*). The recognition of this, which was very fully and strongly made by the Reformers, not only gives to Protestant theology a firmer position as against the claims of Rome than it can have without it, but also enables us to give their due place to the elements of truth, exaggerated and distorted, in the Romish doctrines of the authority of the church, fathers, and councils. If we have the witness of the Spirit, giving us an assurance of the truth and insight into the meaning of Scripture, we must admit that our fellow Christians have the same guidance also, and that believers have had it in all ages. Hence we may reasonably allow great weight to the opinions of men who have given evidence of being guided by the Spirit, and more especially to those doctrines that have been received as scriptural by the great body of the spiritually enlightened in different ages. Thus the teaching of fathers and theologians, and the consent of the Christian church, are important helps and guides to the Protestant theologian; only he does not, like the Roman Catholic, attach absolute

- Ps. xix. 1-6; Rom. i. 19-21; Acts xiv. 15-17, xviii. 24-29.

² Coesterzee, *Christian Dogmatics*, sec. viii.

authority to any of them; and he esteems them, not simply because of their antiquity or their official position, but in proportion to the evidence they have given of being really guided by the Divine Spirit, who is the Spirit of holiness, love, peace, and godliness.

This inward spiritual enlightenment of the believer corresponds very nearly to what has been called Christian consciousness, to which a prominent place has been assigned among the sources of theology by many modern divines. The currency of the phrase is due mainly to Schleiermacher, and the form of it proceeds from his fundamental principle, that religion consists properly in feeling, by which we have an immediate consciousness of the divine—a "God-consciousness." Whatever justification this view may have had, as a needed protest against the previously dominant intellectual view, that made religion virtually an affair of the understanding only, it is now generally admitted that Schleiermacher went to an extreme on the other side, and that no complete account of religion can be given that does not include the exercise of thought and will, as well as of feeling. In so far, therefore, as the phrase Christian consciousness represents in its form the one-sided conception of Schleiermacher, it is insufficient; and that which really corresponds to it is the Christian life, with its full complement of beliefs, emotions, and volitions. This, being the work of the Divine Spirit in the soul, may and must be recognized, on the principles already indicated, as the expression of the witness of the Spirit, by which the authority and meaning of the revelation in Scripture are established. In this sense, therefore, Christian consciousness, or the knowledge that a Christian has of his own religious experience and of what is implied in it, is a legitimate means of obtaining doctrinal conclusions. But if the authority of Scripture is to be recognized as the objective and normative representation of what true Christianity is, Christian consciousness can only be a mediate and subordinate source of theology, a channel rather than the fountain-head.¹ By giving it this position we are also saved from the one-sided subjectivity and variable individualism that must result from its being made a primary and independent source of knowledge. The history of the church, especially as it presents to us the expression of Christian faith and devotion in different ages and countries, gives us an insight into the religious life of the church as a whole, and so exhibits the Christian consciousness on a large scale as it were; but if we do not believe in an absolutely infallible guidance of the church, we cannot regard this either as a primary or authoritative source of doctrine, but must always test it by the standard presented in Scripture.

From these various sources, (1) God's manifestation of himself in nature, (2) His revelation in Jesus Christ authoritatively recorded in Scripture, and (3) His enlightenment of the believing soul by the Spirit in Christian life, when used, as they should be, in combination and in their proper order and subordination, we have a large supply of materials for the construction of a dogmatic system.

What then is the method to be followed in order to deduce general principles and laws of mutual relation from the mass of facts and truths thus presented to us bearing upon God's character and dealings with men? This is the next question that arises in regard to dogmatic theology. Now, plainly, if this study is to have a scientific character at all, it must be pursued in the same methods that are proper in other sciences of a similar kind. Theology, no doubt, differs in some important respects from all other sciences; but the difference lies in its matter rather than

in the form of its elaboration. Its materials are not merely the phenomena of nature, but the great redemptive and saving works of God made known by revelation. In this respect it differs from all merely natural sciences. But if it is to have any analogy to them at all, it must apply to these facts of revelation the same processes by which the facts of nature are made to yield natural sciences. Now, there are just two essentially distinct methods by which general laws and principles can be ascertained,—the analytic or inductive, and the synthetic or deductive. Neither of these, indeed, can be absolutely separated from the other. Induction in physical science, for example, calls in the aid of deduction, when hypotheses are formed to explain certain phenomena; and then it is tested by tracing them downwards to what would be their results whether they are true or not: and, on the other hand, geometric demonstration seeks the aid of analysis as a guide to the solution of its problems. And not only in subordinate points, but as wholes, the two methods supplement each other. There can be no concrete science that does not begin with induction; and there is no complete science unless it ends in deduction. All knowledge of facts must be *a posteriori*; and from these we ascend to general principles and laws; but the aim of all such procedure must be to reach such a complete and satisfactory explanation of all the phenomena, that the process might be reversed and the facts deduced from the most general principles. It is only in a few sciences, *e.g.*, mechanics, that such a degree of perfection has been attained as to enable them to enter on the deductive process. Now it is a question debated by some of the ablest divines, whether theology can adopt this method. It is not denied by any that the inductive method, or that of empirical reflection, as it is called in Germany, is competent; but some maintain that, while this is so, that of speculation is also legitimate and possible, and that it must be followed, if we are to have a theology in the highest and most proper sense of the term. Those who take this position are for the most part of the Hegelian school, and we have a favourable specimen of the way in which it may be maintained in a truly believing spirit in Rothe.² But the considerations adduced by Julius Müller³ against the possibility of such a method, if we are to avoid a pantheistic view of the universe, seem conclusive. The real and thorough-going recognition of personality and free will, both in God and man, makes it impossible to arrive at the phenomena of Christianity by any process of *a priori* demonstration; and more particularly, neither the fact of sin on the one hand, as the act of the free will of man, nor of grace on the other, as the work of God's free will, can be exhibited in their essential character in such a method. No science that has to do with the events of a real history in which rational and moral agents are recognized as acting with true liberty can be constructed by *a priori* deduction of logical consequences from abstract necessary first principles. The dogmatic theologian therefore, who maintains the freedom alike of the human and of the divine will, is shut up to the *a posteriori* method of induction. Even though the existence and attributes of God could be satisfactorily demonstrated by reasoning from necessary truths and laws of thought, as Anselm, Descartes, Clarke, and others thought possible, yet when we come to inquire what God has done, and on what principles He acts, we must, if the world's history is not a mere nature-process, learn from experience and testimony the facts, and ascend inductively from them to the principles or laws that direct them. The inductive method, therefore, is the one proper for Protestant evangelical dogmatic. This is recognized by writers so different in many respects as Dr

¹ This view of the nature and function of Christian consciousness is that taken by Martensen, *Dogm.*, sec. 29, J. T. Beck, *Einleitung in das System der Christlichen Lehre*, Oosterzee, *Dogm.*, sect. 10.

Chalmers,¹ Julius Müller,² Hodge;³ and it has been practically followed by most evangelical divines. They have indeed sometimes disguised the real nature of their method by the arrangement of topics adopted, for the almost universal practice has been to begin the systematic exhibition of Christian doctrine with the loftiest and most recondite part of the subject, which would come first in a really deductive treatment, and to descend from them to those that are more immediately verified by experience. This has tended to produce the impression that these systems are properly chains of logical demonstration, especially as doctrines once held to be established are often appealed to as forming part of the proof of other doctrines. In many cases, however, this appearance is deceptive; and the system, though wearing a deductive garb, is not really of that nature. Each of the doctrines is established on its own proper basis of Scripture testimony and Christian experience; and the order of progress, from above downward, does not show the order in which the doctrines have been ascertained, either by the church in general or by the individual theologian, but only the order in which it is thought best that they should be exhibited and taught.

Besides these two distinct methods, the speculative or deductive, and the empiric or inductive, a third is recommended by Beck, and approved also by Oosterzee, called by the former the *real-genetic*. This proceeds on the assumption that the object of theological knowledge is faith, *i.e.*, according to Beck's use of the term, spiritual life in the soul apprehending as its object God in Christ. This faith or spiritual life has, he points out, a principle of development and growth; and theology grows by following the growth of faith in the soul. But the life of faith in us is not perfect; it is liable to hindrances and abnormal development; hence this by itself is not a safe guide for theology. There is, however, a perfect archetype (*Urbild*) of the true and normal development of faith in the soul, and that is to be found in revelation. The revelation of which we find the record in Scripture has the same course of development as the subjective life of faith in the soul; and the growth of revelation is the perfect pattern of what the growth of faith within us should be. In order, therefore, to be a representation of the faith or spiritual life of the Christian in its ideal condition, theology has to follow the development of revelation as presented to us in Scripture, and must first go back to its primary source, and trace from thence its growth and development. Hence the designation of the true dogmatic method as *real-genetic*. Now whether or not the results of theological inquiry will come out in this particular form depends on the truth or falsehood of a number of positions, and these can only be established by the examination of facts and evidence bearing on the case. This method, therefore, does not in principle differ from the inductive or empiric one; it is only a special form which that method will assume, if the views of Beck as to the relation of revelation to the life of faith in the soul are true and borne out by evidence. It does not, therefore, seem proper to regard this as a distinct kind of method, and we may legitimately claim those who follow it as disciples in general of the inductive school.

On the whole, there appears no reason why the principles of inductive philosophy, which have been so fruitful in their application to the sciences of external nature, should not be applied to materials, bearing on the relation of man and the world to their Author, that are furnished by the phenomena of nature, the dictates of conscience, the facts of revelation, and the experience of the Christian life. Surely, too, the endeavour to do this is neither a hopeless nor an impossible one. Those who have objected most

strongly to the application of logic to theology, such as Isaac Taylor⁴ and Bishop Hampden,⁵ will be found at bottom to object chiefly to the use of a merely verbal and deductive system of logic, and not to that inductive method which is the mighty instrument of the progress of modern science. But it must be admitted that the processes of theologians have too often been, and too often still are, of that merely formal and logical kind that cannot really increase our store of knowledge. If dogmatic is to hold its ground as a true science at all, it must frankly and consistently adopt the inductive method, and it must take as the objects of its analysis, classification, and induction, not merely the statements of Scripture, but the religious realities which those statements, as well as our own experience, make known to us.

Further, if a scientific character is to be vindicated for dogmatic, it must also accept the position of a variable and progressive study. This does not imply that nothing is certain within its domain, or that there must be a constant flux and reflux of opinions about its contents. It is as much characteristic of science that it has certain well-established principles and results, which are not to be overthrown by any future inquiries, as that it is constantly advancing to further acquirements and discoveries. Those who claim an absolutely fixed and unprogressive character for theology, though they may seem to do honour to its divine authority, really degrade it from the rank of a science; and if they retain any reverence for it at all, can only do so on the principles and in the spirit of Roman Catholicism. Thus Macaulay's brilliant statements to that effect,⁶ which are sometimes quoted by those who defend an immobile orthodox theology, imply as their basis either a contemptuous dismissal of theology altogether as a tissue of uncertainties, or a lurking belief that the one unchanging system is to be found in the faith of the Church of Rome. What has tended, and still tends very powerfully, to obscure the idea of progress in dogmatic theology is the want of a clear apprehension of the distinction between religion and theology, and the notion that the Bible is directly a revelation of theological dogmas, which need only to be correctly interpreted and arranged in logical order. If this were so, then we should be able at once to construct a complete system of theology, by simply applying the laws of grammar and logic to Scripture, and this could be done as correctly and well in the 2d century as in the 16th or 19th. There would be no room, or the very narrowest conceivable, for progress. In that case, then, if it were found that students dealing thus with Scripture came to widely different conclusions as to the system of doctrine to be drawn from it, we should be obliged to conclude that the revelation was not complete or unambiguous, and therefore that it must either be supplemented and checked by a living authority in the church to determine its true meaning, or that no certain knowledge in regard to doctrine can be attained. The former is the Roman Catholic, the latter the sceptical or anti-dogmatic alternative, but both alike proceed from the same premises, and indicate the impossibility of carrying them out without either giving up the practicability of dogmatic, or seeking it in an infallible church.

But this difficulty disappears when the Bible is regarded as a revelation, not solely or directly of doctrine, but of religion. On this view, it is the inspired record of the great historical events by means of which the religious fellowship of man with God has been established, and gradually elevated to its perfect form in Christianity, and

of the inward experience of that fellowship in a new life produced by a moral and spiritual renovation of the soul of man. Doctrines, or general principles bearing on the relation of God to man, are indeed contained in the Bible, but only as they are involved in the great realities that the Bible makes known to us. The Bible is to the theologian what the telescope is to the astronomer, or the microscope to the physiologist. Many of the laws of these sciences could not have been known without the help of these instruments,—not because the telescope discovers to us laws of astronomy, or the microscope enables us to see the principles of physiology, but because they bring within our ken the phenomena from which these laws and principles may be ascertained. So the Bible does not directly reveal dogmatic principles; but its function is to reveal to us that great work of renovation by God in Christ, from which the principles of Christian dogmatic are to be derived. On this view, while the Christian religion is ever one and the same, unalterable in all ages, Christian theology, or the scientific knowledge of that religion, is constantly progressive. All its truths are indeed contained implicitly in the Bible, but they have to be drawn from it, not by a mere process of interpreting and systematizing the words of Scripture, but by apprehending and experiencing the realities made known to us by the words, and so coming to understand what they are and in what relations they stand one to another. It is in this way that all the great doctrines in theology have been established,—not merely by the application of grammar and logic to the text of Scripture, but by the apprehension and experience of the renovating change, and the comparison and understanding of its different parts. So, for example, the doctrine of the Logos was formulated by men like Justin Martyr, who, after vainly searching for truth in all the schools of philosophy, found that there is in Christianity, when sincerely received, a light that dispels the darkness and doubt of the mind. So Augustine learned the doctrines of original sin and divine grace, by finding in his own experience the power of inward corruption on the one hand, and the deliverance wrought by the gospel on the other. So Luther discovered the truth of justification by faith, through learning by sore and bitter conflicts how impossible it was to find peace of conscience, as long as he trusted to any works of his own, and how fully he obtained it by faith in Christ. In this way the system of dogmatic has been built up, one doctrine after another being added, as it was discovered and verified by the experience of the church. None of these developments was any addition to the Christianity of true disciples of the Lord, that remains substantially the same in all ages, and contains implicitly all true doctrines of religion. But all Christians are not conscious of what is involved in their religion and experience, and some are very imperfectly aware of it. The men who have made their mark in theology have been those who have been led by circumstances, and enabled by their intellectual powers, to discern elements in Christian life not previously seen, and the body of the church, coming after them, have verified and accepted the results of their experience. In this way dogmatic theology hitherto has been progressive, and no man or church has a right to say that the goal has been reached beyond which no further progress is possible.¹

There is one condition always to be borne in mind, with which alone such progress is sound and genuine. It is that what is added to the system of doctrine be really an expression of the Christianity which is revealed in Scripture. Anything that is not such may be a fancy of men,

or an abnormal development of spiritual life, but it is not really a discovery of Christian truth. There have been opinions held and widely prevalent that are of this character, and it is part of the work of the theologian to detect and remove what is false as well as to build up what is true. There have been false developments of doctrine; there have been exaggerations and maladjustments of important truths. It is not probable that any minute and elaborate system consists of pure and absolute truths unmixed with any error. The work of progress in theology, therefore, must sometimes consist of undoing what has been laboriously built up in past ages. But if any true progress is possible now, it is not to be expected that all the old beliefs will have to be swept away, and an entirely new system put in their place. For if nothing had been ascertained in the course of the ages during which so many great minds have been directed to the study of theology, there would seem to be little hope of anything certain being discovered now. Those who think theology to be a progressive science can most consistently hold that some progress has been made already, and some conclusions have been reached that are not to be overturned by any new inquiries. They do not look for an entire reversal of old beliefs, and a new theory of the universe and its relation to God to be put in their place; they expect that what has been most generally agreed upon in former ages will be maintained and confirmed, and that any new truth that may be brought to light will fit in to the old foundations; though in some cases former modes of statement may have to be reconsidered and adjusted to larger and deeper views, and exaggerated or one-sided doctrines may have to be given up or modified. There are some doctrines in every system that are merely sectarian, adopted by one particular branch of the church, but not recognized by others as correct expressions of Christian faith and life, *eg*, the Anglican dogma of baptismal regeneration, or the Lutheran tenet of the communication of attributes in the person of Christ, or the supralapsarian and sublapsarian theories of Calvinists, in regard to such points there is no just ground of confidence of their permanence; they are like plausible but unproved hypotheses in science. But there are many leading doctrines which, ever since they have been distinctly formulated, have been accepted by the great mass of Christians in all branches of the church; these may be said to be established results of theological investigation, which no further progress of the science is likely to overthrow.

The progressive character of dogmatic, and the manner of its progress in the past, may be seen from a brief sketch of its history from the end of the apostolic age to the present day. The apostolic writings themselves do not properly fall within the range of such a history; for they are not of the nature of human science but of divine revelation. No doubt several of them present to us conceptions and trains of thought that are very analogous to the systems of later times, and have sometimes been employed as the basis of dogmatic systems. But the inspired writers do not stand in the same line as the thinkers who came after them, their aim in writing was not the scientific one of investigating the principles of Christianity in their mutual relations, but the more primary religious one of presenting Christianity itself to the world. This they have been enabled to do, by the working of the Spirit in them, with a power and fulness and insight that throw much light on the scientific study of Christian doctrine; but their writings are not doctrinal systems, and do not come into the line of the rise and progress of the human science of dogmatic. Its history begins with the attempts of men to comprehend the revelation of Christianity, and presupposes that revelation complete, though not completely

¹ Cf. Candlish's *Cunningham Lectures*, Lect. vi. Note A; Rainy's *Cunningham Lectures*, "On the delivery and development of doctrine," Lect. v.

understood, as its starting point. From that point onward it may be regarded as passing through six pretty well defined periods or stages.

I. The first may be called the apologetic age, extending from the apostolic time to the death of Origen (254 A.D.), in whom it may be said to have culminated. During this period the intellect of the church was gradually awakening and coming into activity; but it was only by degrees, and in the course of several generations, that its efforts led to any properly doctrinal results. The very earliest Christian literature is simply practical and hortatory, chiefly in the form of epistles (Apostolic Fathers). From the middle of the 2d century, however, the need was felt of defending the church's faith against argumentative attacks, whether popular, literary, or philosophic. Hence the chief mental power of the Christian community was turned in the direction of "apologies," by which these attacks were repelled, and attention was directed mainly to the evidences of the truth and divinity of Christianity. This, however, indirectly led to the articulate statement of some of the most essential doctrines of Christianity, and to the beginnings of a dogmatic system. The great apologetic question was generally and rightly conceived in the form of a search for some true and reliable teaching about God and divine things; and the Johannine idea of Christ as the light of the world, the Logos or Word of God, naturally occurred to the apologists as that which most exactly met the want. Thus the doctrine of the Logos, in some at least of its aspects, was brought out. Then in the conflicts with Gnosticism, which may be said to be as really apologetic as those with Judaism and heathenism, certain aspects of Christianity were very distinctly brought into consciousness, such as the creation of all things by God, the reality of the human nature, death, and resurrection of Christ, the universality of the gospel, and the responsibility of man. The apostolic creed probably shows us how the original baptismal formula became the basis of more definite articles of faith, shaped in the light of the apologetic necessities of the age. But while there was thus an inevitable tendency towards dogmatic development and definition, there was not for long any direct interest in doctrine as such, still less in the ordering of doctrines into a system. Origen was the first in whom this impulse was strong and active, and his work *De Principiis* (Περὶ Ἀρχῶν) may be said to be the earliest attempt in the field of dogmatic.

II. The second great period in the history of dogmatic, extending from Origen (who died 254) to John of Damascus (who died 754), is distinguished from the first by its being occupied mainly with controversies within the church, and thus may be called the polemic age. As the gospel spread more and more throughout the world, and gained the victory over paganism in the minds and hearts of the most enlightened of the day, the defence of Christianity against external assaults gradually ceased to be the one all-engrossing duty of the church's theologians, and at the same time heresies so thoroughly and manifestly antichristian as those of the Gnostics ceased to have any prevalence among Christians, and other divergent views, of a less openly hostile nature, began to appear. As the doctrine of the Logos had been one of the first that the church was led to think out in the apologetic period, it not unnaturally became the point at which varying conceptions first came into conflict. On this, as on many other subjects, the Christian redemption is so full and many-sided that it is no wonder that its entire contents could not be grasped at once and by all minds, or that some were led to accept some aspects of it more readily than others, and to give these an exaggerated predominance. Hence the progress of Christian thought to the right understanding of

divine truth has been through a series of controversies and oscillations from one extreme to another. This process may be said to have begun about the middle of the 3d century, from which time to the end of the 7th there stretches a continuous series of controversies on questions relating to God and the Trinity, the incarnation and person of Christ, original sin, and regenerating grace. In the course of these, successive forms of opinion on these subjects were discussed, condemned, and stamped as heresies—the Sabellian, Arian, Apollinarian, Macedonian, Nestorian, Pelagian, Monophysite, Semi-pelagian, Monothelite doctrines. In sharp contrast with these opposing heresies, and sometimes in a narrow strait between them, the doctrine of the church was defined more and more precisely. As authoritative expressions of this doctrine we have the first six œcumenical councils, with the provincial ones in the West that condemned Pelagianism and Semi-pelagianism, and the creed of Nicea (325) as enlarged and altered at Constantinople (381), with the decisions of Chalcedon (451) against Monophysitism, Orange and Valentin (529) against Semi-pelagianism, and Constantinople (1st Trullan, 680) against Monothelitism.

This long series of keen and varied controversies on the loftiest doctrines represents a vast amount of intellectual activity in the field of dogmatic, and some of the greatest names in the church's history belong to this period. Athanasius, Basil, the two Gregories, the two Cyrils, and Chrysostom in the East, and Ambrose, Augustine, and Hilary in the West, are but a few of the more outstanding and best known of the church's teachers during these controversies. On the whole it may be said that they have done their work satisfactorily and well, in establishing the true Christian view on the special doctrines they had to discuss; and the decisions of the church on these points have been very generally accepted in after times. The Reformers adopted either tacitly or expressly the whole body of them as in accordance with Scripture; and even in the immense upturning of opinions on all theological doctrines that has been going on in modern times, the faith of Nicea has been maintained by the majority of theologians. Even the more detailed creed of Chalcedon is questioned by comparatively few, though the still more minute discussions and definitions after that have ceased to command the respect and interest of the modern church. But while the theologians of this polemic period were thus successful in establishing and defining some of the more important doctrines of Christianity, and by so doing contributed very valuable materials for dogmatic, they did little or nothing towards the construction of the system as an organic unity. Very few of their works even attempt such a task. The *Catecheses* of Cyril of Jerusalem contain an exposition of the various articles of the creed, and so may be said to exhibit a body of divinity such as was then generally held; but they do so not in a scientifically theological manner, but rather in that of simple popular teaching. Augustine's *Enchiridion, de Fide, Spe, et Caritate*, is a more properly theological attempt to lay the basis of a connected and organic system; but it is very brief and summary, and holds a very subordinate position among the writings of that great father in comparison with his argumentative and controversial treatises on the particular doctrines that he did so much to elucidate and defend. Perhaps a more real evidence of a sense of the organic connection of all the doctrines of Christianity is to be found in the recognition of the affinity between the apparently unconnected heresies of Nestorianism and Pelagianism, which were both alike condemned by the council of Ephesus in 431.

The results of the polemic discussions of nearly five centuries were gathered by John of Damascus into a series

of dogmatic propositions in his work ἀκριβὴς ἐκδοσις τῆς ὁρθοδόξου πίστεως, which remained for the Eastern Church the chief authority in theology for a thousand years after. There has been, however, no living onward movement in the comprehension of Christian doctrine in the Greek Church; and if on this account that great section of Christendom has escaped the rigid formulating of the many corruptions in doctrine, government, and life that took place in the Western Church, it has been at the expense of resting in a system of mere dead orthodoxy that could neither hinder nor heal practical corruption. In the West, however, there was a powerful intellectual life, even in what are generally called the Dark Ages; and that being directed towards the doctrines of the church gave a continual progress and a new epoch to theology, though in a peculiar and not the most healthy form.

III. The third period in the history of dogmatic, extending from the 8th century to the beginning of the 16th, may be called in general, from its most remarkable development, the scholastic age, though scholasticism, strictly so called, is usually reckoned to extend only from the 11th century to the middle of the 15th. But the times before and after these narrower limits were characterized, only in less degree, by the same general tendency of thought. The doctrines of the church were established as of indisputable authority, and had begun to be collected in the form of books of sentences (*Sententiarum Libri*) from the fathers, by Isidore of Seville, and others; and by means of such compilatory labours the learning and theology of former ages were preserved through the devastating flood of the barbarian immigrations. Any fresh theological discussions in this age were few and unimportant, tending for the most part in the direction of sacerdotalism, as in the formation of the dogma of transubstantiation. But by and by a mighty intellectual force took hold of the whole collected dogmatic material, and reared out of it the great scholastic systems, which have been compared to the grand Gothic cathedrals that were the work of the same ages. The character of these systems of dogmatic may be understood by bearing in mind the two leading principles of the scholastic thinking. One was the acceptance as of absolute authority of whatever had been decided in Scripture or by the church; and the other was the application of the notions and syllogisms of formal logic to these doctrines, for the purpose of demonstrating their truth to the understanding.¹ With such principles, it was natural that the systems constructed should be lacking in unity and a real grasp of the essence of Christianity. They attempted, indeed, the harmonizing of philosophy and theology, of reason and faith, but they could only do so in a mechanical way, and by a kind of compromise. On the one hand, reason was entirely subjected to faith in the acceptance of all the doctrines of the church as so many decisions or sentences that were not to be criticised or called in question. This made it impossible to grapple with the fundamental and general principles underlying the particular opinions that were received as authoritative; and it was only in regard to their details and application that free inquiry was allowed. Hence in the scholastic works we find a series of doctrines or questions on different subjects following one after another, but not connected in any natural way as parts of one organic whole. On the other hand, however, reason was allowed such full scope in deducing consequences from the established doctrines, and that by purely formal processes, that a rationalistic character was imparted to a large extent to the whole body of the scholastic theology. At the same

time, as reason was excluded from the great questions of principle, by the absolute authority accorded to the church's decisions, it could only find scope in questions of detail, and the more intellectual vigour was applied to theology the more minute, subtle, and unprofitable did its results become. The scholastic age produced no system of Christian doctrine that has, as a whole, retained any value in after ages; though in it some doctrines were more distinctly articulated than before,—particularly that of the atonement, by Anselm; and the keen and subtle analysis to which all doctrines and conceptions were subjected has produced many distinctions that have been found useful in later times as conducing to clearness of thought.

The decline and fall of scholasticism was due to the gradually awakening consciousness of the unsoundness of the principles on which it rested. The nominalistic controversy shook men's faith in the absolute identity of thought and being, reason and authority; and the identification of theology and philosophy came to an end. The latter refused to be any longer the mere handmaid of the church; and from the assertion of its freedom the history of modern philosophy dates. This was necessarily a fatal blow to the scholastic theology; and at the same time the great religious movement of the Reformation made a reconstruction of the system of church doctrine necessary.

IV. The age of the Reformation, occupying the greater part of the 16th century, may be said to form by itself a fourth period in the history of dogmatic, for it was animated by a spirit that distinguishes it both from the preceding and from the following time. The Reformation was a movement too full of spiritual life and activity in many directions to be adequately described by any single phrase; but for the present purpose it may comprehensively enough be said to be the reassertion of the principle of the direct and personal relation of the believer to God. This involved the sweeping away of all ecclesiastical authority and mediation, and the assertion of the sole authority of God's word and of justification by faith, which have been called the formal and material principles of Protestantism. This also necessarily brought with it a new conception of theology. Christianity was no longer a new law, and saving faith was no longer the intellectual assent to certain doctrines; Christianity was a new life, offered in the gospel and received by the soul's trust (*fiducia*) in Christ. Hence, when the Reformers came, as some of the greatest of them did, to give a systematic statement of Christian doctrine, they not only rejected those tenets which had been held in the mediæval church on no higher authority than that of tradition and ecclesiastical decisions, but they also found that they could exhibit a much more organic unity in the body of Christian doctrine, because they regarded it not as a necessary means or step towards spiritual life, but as the outcome and systematic presentation of that life which is obtained and preserved directly by faith in Christ. The great theological works of the Reformation age were not for the most part written purely in the interest of science or system, but for more practical purposes, for the defence of the new doctrines against attacks made upon them, or for the guidance of ministers in the practical teaching of the people. But it is nevertheless true that in these ways were produced works which had more of the symmetry and unity of a complete system than any that had previously appeared. This can only be accounted for by assuming that the Reformers had laid hold of the right principle of theology, and that the new life of the Reformation had carried them above and beyond the mistaken view of Christianity that had long hindered a right construction of dogmatic. The *Loci Communes Theologici* of Melancthon (1st ed. 1521, final form 1550), and the *Institutio*

¹ See Hampden's *Bampton Lectures*, p. 46, 347; Schwegler's *History of Philosophy*, sect. xxii; Baur, *Vorlesungslehre*, p. 147, foll.; Hagenbach, *Dogmengeschichte*, sect. 149.

Religionis Christianæ of Calvin (1st ed. 1535, final form 1559), are the two chief systematic works of this period, and have formed the starting-points of the Lutheran and Reformed dogmatic respectively. The system expounded in them is summarily set forth in the several Protestant Confessions of this era, and various special doctrines were elaborated and defended by other leaders of the Reformation. The Reformers accepted the doctrinal statements of the ancient creeds and of the first four general councils as scriptural and true; they also adopted with great earnestness the Augustinian doctrines of grace, while they added to them the principle with which Luther's name is inseparably associated of justification by faith, and that of the supreme authority of the Bible as the rule of faith and life,—both of these being in their view witnessed and guaranteed by the testimony of the Holy Spirit. Maintaining these principles, they rejected the authority of the church, the multiplication and magical efficacy of the sacraments, the merit of good works, monastic vows, penance, purgatory, and other corruptions of the Middle Ages. In their hands, theology lost the merely objective character that it had borne in patristic and mediæval times, and was brought into closer connection with religious and Christian life, by the recognition and cultivation of its subjective side. The vital matter with them was, not to have right opinions about the Trinity and the hypostatic union, but to be sure of the true way of salvation by Christ. Their writings are pervaded by a warmth of spiritual life, as well as by a freshness of theological thought, that mark them as the genuine products of a creative age in the history of Christian doctrine. The Reformation age may be said to have closed with the final fixing of the Protestant doctrines in the generally-accepted symbolical books, which took place for the Lutheran church in the adoption of the *Formula Concordiæ* in 1580, and for the Reformed churches in the decisions of the Synod of Dort in 1618–19. Even earlier, however, a declension may be observed from the lofty and free spirit of the first Reformers; and a somewhat different character began to mark the theology of both the branches of the Protestant church.

V. A fifth period in the history of dogmatic, which may be called the confessional one, extends from the beginning of the 17th till near the end of the 18th century. During this time the doctrinal systems, of which the foundations had been laid by Melancthon and Calvin, were elaborated and carried into details with great learning and acuteness; the various doctrines were most carefully and precisely defined, distinguished, and defended. The 17th century was an age of theological controversy. The Roman Catholic Church had recovered from the shock of the Reformation, and by the aid of the Jesuits and the powerful reaction inaugurated by them, had regained strength not only materially but intellectually. Controversialists like Bellarmine, Petavius, and Bossuet taxed the learning and ingenuity of Protestantism to meet them. There were also many less necessary and profitable controversies among Protestants themselves; and almost every theologian was led to devote his energy to the attack of what he held to be error, and the maintenance of true doctrine. Much valuable argument was brought into use in the course of these discussions, and the system of dogmatic was more fully worked out than it had been before. The great dogmatic works of the 17th century, such as those of John Gerhard, Calovius, Quesenstedt, and Baier in the Lutheran church, and of Francis Turretin, Mastricht, and De Moor among the Reformed, are more minute, precise, and full in their exhibition of the doctrines of the faith than the writings of the Reformers, and they contain a great deal of vigorous and profound thought. Never probably have the doctrines which they handle been so ably and thoroughly

discussed. They were, however, treated somewhat in the scholastic method that had prevailed before the Reformation. The theologians of the 17th century did indeed clearly perceive and firmly maintain the principle of the sole authority of Scripture, which was one of those involved in the revolt against the authority of the church and hierarchy of Rome. Hence, in point of matter, their systems are vastly superior to those of the schoolmen, freer from traditional and sacerdotal dogmas, and far more in harmony with apostolic teaching. But they failed to apprehend a deeper principle that was implicitly contained in the Reformation movement, viz., that Christian doctrine, instead of preceding Christian life as a necessary means to it, must come after its actual experience. Sound doctrine was regarded as the preliminary condition of spiritual life; and as it had thus to be established apart from the living experience of Christianity in the soul, it must rest on purely external authority. This was found in an extreme and one-sided view of the inspiration of Scripture, as equivalent to verbal or literal dictation, and in an uncritical and indiscriminate use of proof texts from all portions of Scripture, without due regard to their historical connection and scope. These became to many of the divines of that age very much what the sentences of the fathers and councils had been to the schoolmen; and an undue weight was sometimes allowed even to the avowedly human forms in which Protestant doctrine had been expressed. An excessive subtlety and minuteness of definition were also often adopted; and when these were made matters of faith in different parts of the church, numerous schisms and separations took place. The rigid exclusiveness of the Lutheran divines on the basis of the *Formula Concordiæ*, the intolerant zeal of the Anglicans for episcopacy and ceremonies, the extreme doctrinal minuteness of the *Formula Consensus Helveticæ* of 1675, and the narrowness of some of the English Puritans and Scottish Presbyterians are instances of this tendency; and the disastrous effects of many of these are well known. The issue of this form of theology was very similar to that of the scholastic system. It was gradually undermined by the spirit of rationalism calling in question the validity of its minute definitions. This tendency had been active from the time of the Reformation in various forms; and though for long it was controverted and excluded from the Protestant Churches, in the course of the 18th century it brought about a general disintegration of their dogmatics. It was found that there was not sufficient evidence to maintain the too minutely articulated systems in the face of a more critical study of the Bible; and the orthodoxy that had rested on an insecure foundation was for a time almost entirely overthrown. In nearly all the churches there came, in various forms, an age of indifference and even unbelief in the old doctrines of the gospel; and this was generally accompanied with a declension in spiritual life. It was in Germany that the sceptical movement took the most pronounced form; and there, accordingly, the break with the theology of the 17th century has been most complete. In this country the triumph of rationalism has never been so absolute, and the transition to a new era in the history of theology has not been so marked.

VI. But a new period has undoubtedly come, since the beginning of the present century. A reaction has set in against the rationalism that overthrew the older dogmatics. In some cases, indeed, this has taken the form of a simple reassertion and re-establishment of the old systems of doctrine, as in the school of Hengstenberg, Hävernick, Philippi, and others, who maintain the Lutheran orthodoxy in all its rigidity, and in many British and American divines, who reproduce the Calvinistic system in its precise 17th century form. But by many the need is felt of more thoroughly

carrying out the principles of the Reformation than was done in the succeeding age, so as to place the dogmatic system on a surer basis. Schleiermacher exercised great influence on theological thought, and though he did not succeed in emancipating himself from the pantheistic principles of his philosophy, his mode of conceiving Christianity and its relation to theology has been fruitful of good results. By a large number of divines it has been felt to be unsatisfactory to base, as was practically done formerly, the whole system of theology on the one doctrine of the inspiration of Scripture, and a broader foundation, as well as a more living conception, has been sought for it, by recognizing as its subject-matter, not merely the sayings of Scripture, but that living Christianity which it is the direct object of the Bible to produce and reveal. This is really a taking up and carrying out more fully of the principles of the Reformation, and it is in this line that dogmatic seems to be cultivated with most prospect of success and stability. There is in the present day much confusion in this as in many other departments of theology, and systems of the most diverse contents and on the most diverse principles are produced in abundance; but the line in which such men as Nitzsch, Martensen, Julius Müller, Ebrard, Oosterzee, Ritschl, and others have been labouring is that which at once maintains the substance of what has been gained in former ages, and is free to welcome modifications and developments on sound and firmly based principles.

Literature—The literature of dogmatic is exceedingly rich and varied, and only the more important and influential works can be mentioned here. Before the Reformation, however, though there are many treatises of primary importance on particular doctrines, and though the more comprehensive works have an historical value, yet there is no complete system constructed on sound principles, so as to be of much direct use. Calvin's *Institutio Religionis Christiane* is the first great work, embracing the whole subject, that is still of direct and primary importance. It is distinguished by a depth of insight into the principles of Christian doctrine, a comprehensive grasp and clear arrangement of their details, a reverence and sobriety in the interpretation and application of Scripture, and a spirit of Christian earnestness and piety that have never been surpassed. Of the later dogmatic systems in the Reformed Church, some are brief compends, among which the *Theologia Medulla* of William Ames, the English puritan, is specially distinguished for precision of thought and power of construction, others are much larger, and greatly exceed in the length and minuteness of their discussions the work of Calvin. Among them Francis Turretin's *Institutio Theologica Elenctica* (1679) is remarkable for the logical power with which he maintains the strict Calvinistic doctrine on all the points controverted in his day. Peter Van Mastricht's *Theoretico-Practica Theologia* (1682-7), is a favourable specimen of the Dutch theology of the time—laborious, accurate, and at the same time profound and spiritual. Of the federal school, as it is called, which exercised great influence on the popular theology of this country, Hermann Witsius's *Economia Fœderum* is a very able and suggestive production. The Arminian system is well represented by the *Theologia Christiana* of Philip Limborch (1686), a work written in a clear, biblical, and conciliatory style.

The Lutheran dogmatic works are even more colossal and voluminous than the Reformed, the greatest of them, John Gerhard's *Loca Theologica* (1609-22), shows a spirit of piety, as well as great learning, exactness of thought, and logical skill. He occupies a middle position between the more rigidly orthodox such as Luther and Calovius, and the so-called syncretism of Calixtus. Of the same general character are the *Institutiones Theologice Dogmaticæ* of John Francis Buddaeus (1724). A very fair idea of the contents of the Lutheran dogmatic works may be obtained from Schind's (of Erlangen) compendious *Dogmatik der evangelisch-Lutherischen Kirche* (1853), which consists mainly of quotations from the old divines on the different doctrines of the system, and from Luther's *Compendium der Dogmatik*. In this country no important systematic treatise on dogmatic as a whole appeared till the publication of Dr George Hill's *Lectures in Divinity* in 1821, a work distinguished by lucid arrangement of topics, and clear and cautious statement of doctrines and exposition of their evidence, though lacking somewhat in spiritual warmth. Dr Chalmers's *Institutes of Theology* (1849) have this last quality in a very high degree, and follow a method that brings dogmatic into closer connection with Christian experience than had been usual, but the system is very imperfectly filled up, and is marked more by brilliant and suggestive thoughts amply illustrated, than by thorough and minute investigation.

The modern era of dogmatic may be said to have been opened by Schleiermacher's *Christliche Glaube* (1821), a work of great genius, learning, and power, which did good service in putting an end to the previously prevalent rationalism, though in some essential respects of a doubtful and defective character. Nearly all who have worked in dogmatic since have been stimulated and influenced more or less by Schleiermacher; but those who have received most from him have in general left behind the pantheistic and emotional elements of his system, and approached nearer to the old faith of the church. Among other works on dogmatic may be mentioned Nitzsch's *System der Christlichen Lehre*, containing in short compass much clear, profound, and enlightening thought, and Martensen's *Christliche Dogmatik*, with its comprehensive, philosophical, and suggestive views. One part of Schleiermacher's system which is given up by these and most modern theologians—his determinism—has been rigorously carried out by Alexander Schwarz in Zürich (*Glaubenslehre der Reformaten Kirche*) and Scholten in Leyden (*Doctrina Christiana Intima; De Leer der Hervormde Kerk*). Against the former Corrad has made a valiant and keen protest in his *Christliche Dogmatik*; while the latter has, since publishing the work, given up belief in supernaturalism entirely. Oosterzee's *Christliche Dogmatik* is a very useful and judicious exhibition of a moderate Calvinistic system.

Of the theologians who endeavour to reproduce more exactly the old Lutheran orthodoxy, the chief are Philipp, whose *Kirchliche Glaubenslehre* is very strictly conservative, and Kalan, who in his *Lutherische Dogmatik* displays a more liberal and critical spirit.

In a similar way, Dr Charles Hodge of Princeton has restated the Calvinistic system of the 17th century in his *System of Theology*, which shows a wonderful acquaintance with the most refined modern literature of the subject, great logical power, and an adherence to the old doctrines that is not in the least shaken by all the diverging views and arguments with which he is so familiar.

For fuller accounts of the literature and history of dogmatic, reference may be made to Harnack's *Lehrsysteme der Theologie*, and to Dr Schind's *Handbuch der Dogmatik*, both of which are published by the Verlag von J. C. Neumann, Neudamm.

DOGWOOD (according to Prior, *Angl. Sax. d. b.*, a brooch pin), the name applied to plants of the genus *Cornus*, of the natural order *Cornaceæ* or cornels. The common dogwood, prick-wood, skewer-wood, or so-called dogberry, *C. americana*, is a shrub reaching a height of 8 or 9 feet, common in hedges, thickets, and plantations in Great Britain. Its branches are dark-red; the leaves egg-shaped, pointed, about 2 inches long by 1½ broad, and turning red in autumn; and the flowers dull white, in terminal cymes. The fruits are of a black purple, are bitter, and one-seeded, and contain a considerable percentage of oil, which in some places is employed for lamps, and in the manufacture of soap. The wood is white and very hard, and like that of other species of the genus is used for making ladder-spokes, wheel-work, skewers, forks, and other implements, and gunpowder charcoal. The red berries of the dwarf species, *C. americana*, of the Scotch Highlands are eaten, and are reputed to be tonic in properties. *C. macrocarpa*, the Cornelian Cherry, a native of Europe and Northern Asia, bears a pulpy and edible fruit, which when unripe contains much tannin. It is the Akenia of the Greeks, and the Kiziljiek of the Turks; by the latter the wood is employed for giving a red dye. The bark of the handsome flowering Dogwood, *C. florida*, and of other American species, is valued as a stomachic and febrifuge, and is administered as a substitute for Peruvian bark. The Jamaica Dogwood, the root-bark of which is poisonous, is the species *Pisidia Erythrina*, of the natural order *Leguminosæ*.

DOL, a town of France, in the department of Ille-et-Vilaine, about 15 miles by rail from St Malo, on an eminence in the midst of a marshy plain, protected from the inroads of the sea by a dyke of the 12th century, which extends for a distance of 22 miles. A quiet, sombre, agricultural little place, with nothing more remarkable in its modern life than the corn-market which is held in the old Carmelite church of Notre-Dame-sous-Dol, it preserves, in the remains of its ramparts and its ditch, the memory of the time when it was one of the most important fortresses

on the frontier between Brittany and Normandy. The streets are still rendered picturesque by the dark houses of the 14th and 15th centuries, which form deep arcades by the projection of their upper stories, and, high above all, in spite of its five hundred years, rises the grey granite of the cathedral, which formerly ranked as the metropolitan church of all Brittany, and still keeps fresh the name of that old Bishop St Samson, who, having fled, as the legend tells, from the Saxon invaders of England, selected this spot as the site of his monastery. To the architect it is interesting for the English character of its design, and to the antiquarian for its stained glass windows of the 13th century, its tombs, and its carvings. The town was twice besieged by William the Conqueror, had thrice to defend itself during the wars of the League, and in 1793 witnessed the defeat of the republican forces by the Vendéans who had taken refuge within its walls. About a mile and a half from the town is the *pierre du champ dolant*, a menhir about 30 feet above the ground, not far off stands the great granite rock of Mont Dol, about 200 feet in height, and surmounted by the chapel of Notre Dame de l'Espérance; and about 10 miles to the south is the castle of Combourg where Chateaubriand spent his early days. Population in 1875, 3356.

DOLABELLA, PUBLIUS CORNELIUS, a Roman general notorious for his profligacy, was born about 70 B.C. His vicious character made itself apparent even in his early years. Before he attained his majority he is said to have been more than once guilty of capital crimes, from the punishment of which he was only delivered through the advocacy of Cicero. In the year 50 he forced his wife Fabia to leave him, and married Tullia, the daughter of Cicero, who strongly opposed the union. Dolabella's motive in establishing this connection was to prevent Cicero from giving evidence in favour of Appius Claudius, whom he had accused of having violated the sovereign rights of the people. In the following year, his numerous creditors having become clamorous, he was forced to quit Rome, and betook himself to the camp of Cæsar, to the great regret of his father-in-law. During Cæsar's absence in Spain, Dolabella commanded the fleet in the Adriatic, but he did not gain any distinction. He took part in the battle of Pharsalus (48), after which he returned to Rome, in the expectation, delusive as it proved, that Cæsar would give him a substantial reward for his services, and so enable him to pay his debts. To gain immunity from the urgent demands of his creditors, he procured his election to the tribuneship, which he had no sooner done than he introduced a bill (*rogatio*) proposing that all debts should be cancelled. This was strongly resisted by his colleagues, and two parties were formed, between whom more than one bloody encounter took place in the streets of the city. On Cæsar's return from Alexandria he saw the expediency of removing Dolabella from Rome, and accordingly took him as one of his generals in the expedition to Africa and Spain. Dolabella was ambitious of the consulship, and obtained a promise of it from Cæsar for the year 44. The latter, however, influenced partly by the strong opposition of Antony, assumed the office himself, and deferred the fulfilment of his promise to Dolabella until he should set out on his expedition against the Parthians. The assassination of Cæsar occurring before this arrangement could be carried out, Dolabella at once seized the insignia of the consulship, and, by making friends with Brutus and the other assassins, was confirmed in the office he had usurped. To ingratiate himself still further with the republican party, he caused an altar erected in honour of Cæsar to be thrown down, and many of those who had sought to offer sacrifices on it to be crucified or thrown from the Tarpeian rock. He did not hesitate at once to change sides, however, when

Antony made it his interest to do so by offering him the command of the expedition against the Parthians and the province of Syria. An unduly protracted and circuitous march was signalized by rapacious extortion, which became still more rapacious when at length Dolabella reached Syria. His crowning iniquity was the murder of Trebonius at Smyrna, which, according to Cicero's account, was preceded by two days' torture for the purpose of discovering the locality and amount of the treasure contained in the town. On hearing of this gross abuse of power, the senate outlawed Dolabella, and declared him a public enemy. Cassius was appointed to supersede him, proceeded to Asia Minor, and had taken Laodicea, when Dolabella in despair caused himself to be killed by one of his own soldiers, 43 B.C.

DOLCE, LUDOVICO, or LUIGI (1508–1568 or 1569), one of the most laborious and multifarious writers of Italy in the 16th century, was a native of Venice, and belonged to a family of honourable tradition but decadent fortune. He received a good education, and early undertook the task of maintaining himself by his pen. His life, even more destitute of outward events than such a life usually is, may be briefly summed up in one word—he wrote. Translations from Greek and Latin, epics, satires, histories, plays, and treatises on language and art followed each other in rapid succession, till the whole number amounted to upwards of 70 works. In his own day his industry was rewarded by no small amount of fame, but he is now mainly memorable as the author of *Marianna*, a tragedy from the life of Herod, which was recast in French by Tristan and by Voltaire, and still keeps a place on the stage. Four licentious comedies, *Il Ragazzo* (1541), *Il Capitano* (1545), *Il Marito* (1560), *Il Ruffiano* (1560), and seven of Seneca's tragedies complete the list of his dramatic efforts. In one epic—to translate the title-page—"he has marvellously reduced into *ottava rima* and united into one narrative the stories of the *Iliad* and the *Æneid*," in another he devotes 39 cantos to a certain Primaleone, son of Palmerius, in a third he celebrates the first exploits of Count Orlando, and in a fourth he sings of the Paladin Sacripante. A life of the emperor Charles V. and a similar account of Ferdinand I, published respectively in 1560 and 1566, are his chief historical productions; and among his minor treatises it is enough to mention the *Osservazioni sulla lingua volgare*, 1550; the *Dialogo della pittura*, 1557; and the *Dialogo nel quale si ragiona del modo di accrescer la memoria*, 1552.

See Tiraboschi, *Storia*, &c., vii, Klein, *Geschichte des Dramas*, vol. v.

DOLCI, CARLO, or CARLINO (1616–1686), a painter of considerable celebrity, was born at Florence in May 1616. He was the grandson of a painter on the mother's side, and became a disciple of Jacopo Vignali, and when only eleven years of age he attempted a whole figure of St John, and a head of the infant Christ, which received extraordinary approbation. He afterwards painted a portrait of his mother, and displayed a new and delicate style which brought him into notice, and procured him extensive employment at Florence (from which city he hardly ever moved) and in other parts of Italy. Dolci used his pencil chiefly in sacred subjects, and bestowed much labour on his pictures. In his manner of working he was remarkably slow. It is said that his brain was affected by seeing Luca Giordano, in 1682, despatch more business in four or five hours than he could have executed in as many months, and that he hence fell into a state of lypochoondria, which compelled him to relinquish his art, and soon brought him to the grave. His works are not very numerous. He generally painted in a small size, although there are a few pictures by him as large as life. He died at Florence in January

1686, leaving a daughter (Agnese), who arrived at some degree of excellence in copying the works of her father.

Carlo Dolci holds somewhat the same rank in the Florentine that Sassoferrato does in the Roman school. Without the possession of much genius, invention, or elevation of type, both these artists produced highly wrought pictures, extremely attractive to some tastes. The works of Dolci are easily distinguishable by the delicacy of the composition, and by an agreeable tint of colour, improved by judicious management of the chiaroscuro, which gives his figures a striking relief, he affected the use of ultramarine, much loaded in tint. "His pencil," says Pilkington, "was tender, his touch inexpressibly neat, and his colouring transparent; though he has often been censured for the excessive labour bestowed on his pictures, and also for giving his carnations more of the appearance of ivory than the look of flesh." All his best productions are of a devout description; they frequently represent the patient suffering of Christ or the sorrows of the Mater Dolorosa. Dolci was, in fact, from early youth, exceedingly pious, it is said that during passion week every year he painted a half-figure of the Saviour. His sacred heads are marked with pathetic or at least strongly sentimental emotion. There is a want of character in his pictures, but the general tone accords with the idea of the passion portrayed. Among the best works of this master are the St Sebastian; the Four Evangelists, at Florence; Christ Breaking the Bread, in the marquis of Exeter's collection at Burleigh; the St Cecilia in Dresden; an Adoration of the Magi, and in especial St Andrew praying before his crucifixion, in the Pitti Gallery, his most important composition, painted in 1646; also several smaller pictures, which are highly valued, and occupy honourable places in the richest galleries.

DOLE, a town of France, at the head of an arrondissement in the department of Jura, 28 miles N. of Lons-le-Saulnier, occupying the declivity of a hill on the right bank of the Doubs, which is there accompanied by the canal between the Rhone and the Rhine. It is the seat of a tribunal of primary instance, and has a Jesuit college, an agricultural society, a school of design, a theatre, a museum, and a public library of upwards of 40,000 volumes. The principal public buildings are the court-house, originally a Franciscan monastery dating from 1572; the church of Notre Dame, a Gothic structure of the 16th century; the Hôtel-Dieu, the prison, the barracks, two hospitals, and the ancient tower of Vergy. Among the manufactures of the town are straw hats, hosiery, chemicals, leather, and agricultural implements, and it carries on a good trade in agricultural produce, wood, iron, and marble. Dôle is believed to have been a station on the Roman road from Lyons to the Rhine, and it still preserves what seem to be remains of an aqueduct, a bridge, and a theatre, of Roman construction. From 1423 to 1481 it was the seat of a university; but there can have been but little study in the year 1479 when the town was taken by Louis XI., and so completely sacked that only Jean Vurry's house, as it is still called, and other two buildings were left standing. It subsequently came into the hands of the Spaniards, and in 1530 was fortified by Charles V. In 1636 it was able to hold out against the prince of Condé; but in 1663 and 1674 it was captured by the French, and on the latter occasion was deprived of its defences. Till Besançon was incorporated with the province, Dôle ranked as the capital of Franche Comté, and was the seat of a *parlement*.

DOLET, ÉTIENNE (1509-1546), a French scholar and printer, whose fame is due as well to the painful romance of his life as to the high importance of his labours. A tradition, of what authority it is hard to say, makes him the illegitimate son of Francis I.; and it is evident that he

was at least connected with some family of rank and wealth. From Orleans, where he was born, he was taken to Paris about 1521; and after enjoying there the instruction of Nicolas Bérauld, the teacher of Coligni, he proceeded in 1526 to Padua. The death of his friend and master, Simon de Villanova, led him, in 1529, to accept the post of secretary to Jean de Langeac, French ambassador to the republic of Venice; but he managed, in spite of his new occupation, to attend the lectures of the Venetian scholar Battista Egnazio, and to write Latin love poems to some Venetian Elena, who died, however, before he left the city. Returning to France in 1530 he proceeded to Toulouse for the study of law; but there he soon became involved in the violent disputes then raging between the different "nations" of the university, roused the anger of the public authorities by his keen condemnation of some of their measures, was thrown into prison, ran the risk of being assassinated, and was finally banished by a decree of the *parlement*. In 1535 he entered the lists against Erasmus in the famous Ciceronian controversy, by publishing, through Sebastian Gryphe at Lyons, a *Dialogus de Imitatione Ciceroniana*; and the following year saw the appearance of his two folio volumes *Commentariorum Linguae Latinae*. In 1537 he obtained from Francis I. a privilege to print during ten years any works in Latin, Greek, Italian, or French which were the product of his own pen or had received his supervision; and accordingly, on his release from an imprisonment occasioned by his justifiable homicide of a painter Campanini, he commenced at Lyons his typographical and editorial labours. That he was not altogether unaware of the dangers to which he was exposed from the bigotry and fierce-heartedness of the times is shown not only by the tone of his mottoes—*Præserve moi, Seigneur, des calomnies des hommes*, and *Durior est spectata virtutis quam incognita conditio*—but also by the fact that he endeavoured first of all to conciliate the theological wolves by publishing a *Cato christianus*, or Christian moralist, in which he made profession of his creed. The catholicity of his literary appreciation, in spite of his ultra-Ciceronianism, was soon displayed by the variety of the works which proceeded from his press—ancient and modern, sacred and secular, from the New Testament in Latin to Rabelais in French. But long before the term of his privilege expired his labours were interrupted by the machinations of his enemies, who neither shrank from bringing against him what was then the most terrible of all accusations, nor relented in their pursuit till their purpose was completely realized. From a first imprisonment of fifteen months their victim was released by the advocacy of Pierre Duchatel, bishop of Tulle; and from a second he escaped by his own ingenuity; but, venturing back from Piedmont, whither he had fled in order that he might print at Lyons the letters by which he appealed for justice to the king of France, the queen of Navarre, and the *parlement* of Paris, he was again arrested, hurried up to the capital, branded as a relapsed atheist by the theological faculty of the Sorbonne, and on the 3d of August 1546 put to the torture, strangled, and burned in the Place Maubert. On his way thither he is said to have composed the punning pentameter—*Non dolet ipse Dolet, sed pia turba dolet*. As if in prophetic mockery of their own proceedings, the doctors of the Sorbonne based their decision on the three words *Rien du tout* or "Nothing at all," inserted by Dolet in a passage of the *Arriochus* of Plato, which even without them denied, if not so emphatically, the immortality of the soul; and thus they did in spite of the fact that according to their own showing, his works must have been full of most damnable heresies, and had already in 1543 furnished excellent fuel to the hangman's fire. Whether Dolet is to be classed with the representatives of Protestantism or with the advocates of

anti-Christian rationalism has been frequently disputed; by the principal Protestants of his own time he was not recognized, and by Calvin he is formally condemned, along with Agrippa and his master Villanova, as having uttered execrable blasphemies against the Son of God; but, to judge by the religious character of a large number of the books which he translated or published, such a condemnation is altogether misplaced. His repeated advocacy of the reading of the Scriptures in the vulgar tongue is especially noticeable.

To the works already mentioned the following must be added:—A volume published by Simon Finet, without the author's knowledge, containing *Orationes duas in Tolosam, epistolarum libri duo, carminum libri duo, and epistolarum amicorum liber, 1533; De re navali liber, 1537; Genethliacum Claudii Dollé, 1539* (a collection of Latin poems on the birth of his son, translated into French as *L'Avant-Naissance de Claude Dolet, 1539*); *La manière de bien traduire d'une langue en une autre, and De la ponctuation française, 1541; Le Manuel du Chevalier Chrétien and Le vrai moyen de se bien confesser, both translated from Erasmus's Latin, 1542; Bref Discours de la République française, 1544; Second Enfer, 1544, a poem giving an account of his escape from prison, which was reprinted in 1836 by Techener. See Née de la Rochelle, *Vie d'Estienne Dolet, Paris, 1799; Joseph Boulmier, "Estienne Dolet," in the Revue de Paris, 1835, and a separate work, Estienne Dolet, sa vie, &c., Paris, 1857; A. F. Didot, Essai sur la Typographie. The procès or trial of Dolet was published in 1836, by A. H. Taillandier from the registers of the parlement of Paris.**

DOLGELLY, a market and assize town of Merionethshire, North Wales, situated at the junction of the Aran with the Wron, and at the northern base of Cader Idris, 19 miles S.W. of Bala and 9 miles E. of Barmonth, with both of which it is connected by railway. The town consists of a series of small squares and narrow streets, the houses being built of stone. It contains a market hall, assize hall, county gaol, and parish church. An old building, described as the Parliament House, is said to have been the place in which Owen Glendower assembled his parliament in 1404. Dolgelly, which is the principal town of Merionethshire, forms a local board district. There is an inconsiderable manufacture of coarse flannels and tweeds carried on by the inhabitants. Population in 1871, 2357.

DOLLOND, JOHN (1706–1761), the celebrated optician, was the son of a French refugee, a silk-weaver at Spitalfields, where he was born, June 10, 1706. He was early trained to his father's occupation, but made leisure for the acquisition of a knowledge of mathematics, physics, Greek, Latin, the elements of anatomy, and other subjects. In 1752 he abandoned silk-weaving in order to join his son Peter, who had entered upon business as an optical instrument-maker in Vine Court, and before long he became universally celebrated as an optician. His last and most important contribution to the *Philosophical Transactions*, for which he, in 1758, received the Copley medal of the Royal Society, gave a description of the various experiments, begun early in 1757, on the combined effect of water and prisms and lenses of glass, by which he was led to the discovery of a means of constructing achromatic lenses. Sir Isaac Newton had stated in his *Optics* "that all refracting substances diverged the prismatic colours in a constant proportion to their mean refraction," and consequently "that refraction could not be produced without colour," for which reason "no improvement could be expected in the refracting telescope." Dollond, however, found that as flint glass causes a greater dispersion in proportion to its refractive power than crown glass, achromatic magnified images could be obtained by using a combination of a doubly concave lens of the former substance with a doubly convex lens of the latter. As the two glasses to be combined were the segments of spheres of considerable curvature, the aberrations from their surfaces were very great, but by varying the surfaces he was enabled to make the aberrations equal, so that, as the refractions of the two glasses were contrary,

they corrected each other. In 1761 Dollond was appointed optician to the king, and became a fellow of the Royal Society. On September 30th of that year, whilst reading a work by Clairaut on the theory of the moon, he had an attack of apoplexy, of which he died in a few hours.

Dollond's published papers are "A letter to Mr James Short, F.R.S., concerning an Improvement of Reflecting Telescopes," a second letter to Mr Short "Concerning a Mistake in M Euler's Theorem for Correcting the Aberration in the Object-Glasses of Refracting Telescopes;" and "A Description of a Contrivance for measuring Small Angles"—*Phil Trans* 1753, pp. 104, 287, 178; "An Explanation of an Instrument for measuring Small Angles," *ibid.* 1754, p. 551; and "An Account of some Experiments concerning the different Refrangibility of Light," *ibid.* 1758, p. 733—See Kelly, *Life of John Dollond*, 3d ed. 1808.

DOLOMIEU, DÉODAT-GUY-SILVAIN-TANCRÈDE GRATET DE (1750–1801), a celebrated geologist and mineralogist, was born at Dolomien, near Tour-du-Pin, in the department of Isère in France, June 24, 1750. He was admitted in his infancy a member of the Order of Malta. When in his 19th year he quarrelled with a knight of the galleys on which he was serving, and in the duel that ensued killed him. In consonance with the statutes of his order, Dolomien was condemned to death for his crime, but in consideration of his youth the grand master granted him a pardon, which, at the instance of Cardinal Torrigiani, was confirmed by Pope Clement XIII., and after nine months' imprisonment he was set at liberty. Throughout that period he had solaced himself with the study of the physical sciences, and during his subsequent residence at Metz he continued to devote himself to them. In 1775 he published his *Recherches sur la pesanteur des corps à différentes distances du centre de la terre*, and two Italian translations of mineralogical treatises by Cronstedt and Bergmann. These works gained for him the honour of election as a corresponding member of the Academy of Sciences at Paris. To obtain leisure to follow his favourite pursuits Dolomien now threw up the commission which, since the age of fifteen, he had held in the carabiniers, and in 1777 he accompanied the bailli De Rohan to Portugal. In the following year he visited Spain, and in 1780 and 1781 Sicily and the adjacent islands. Two months of the year 1782 were spent in examining the geological structure of the Pyrenees, and in 1783 the earthquake of Calabria induced him to go to Italy. The scientific results of these excursions are given in his *Voyage aux îles de Lipari; Mémoire sur le tremblement de terre de la Calabre, Mémoire sur les îles Ponces, et catalogue raisonné des produits de l'Etna*, and other works. In 1789 and 1790 he busied himself with an examination of the Alps, his observations on which form the subject of numerous memoirs published in the *Journal de Physique*. The mineral dolomite, which was named after him, was first described by Dolomieu in 1791. He returned to France in that year, bringing with him rich collections of minerals. On September 14, 1792, the Duc de la Rochefoucault, with whom he had been for twenty years on terms of the closest intimacy, was assassinated at Forges, and Dolomien retired with the widow and daughter of the duke to their estate of Roche Guyon, where he wrote several important scientific papers. The events of the 9th Thermidor (July 27, 1794) having restored the country to some tranquillity, Dolomieu recommenced his geological tours, and visited various parts of France with which he had been previously unacquainted. He was in 1796 appointed engineer and professor at the school of mines, and was chosen a member of the Institute at the time of its formation. At the end of 1797 he joined the scientific staff which in 1798 accompanied Bonaparte's expedition to Egypt. He had proceeded up the Nile as far as Cairo when ill health made his return to Europe necessary, and on March 7, 1797, he set sail from

Alexandria His ship proving unseaworthy put into Tarento, and as Naples was then at war with France, all the French passengers were made prisoners. On May 22, they were carried by ship to Messina, whence, with the exception of Dolomieu, they embarked for the coast of France. Dolomieu had been an object of the hatred of the Neapolitan court since 1783, when he revealed to the grand master of his order its designs against Malta, and the calumnies of his enemies on that island served now as a pretext for his detention. He was confined in a pestilential dungeon, where, clothed in rags, and having nothing but a little straw for a bed, he languished during 21 months. To the complaint that if unsupplied with some necessary he should die, his jailer replied, "What does it matter to me if you do? I have to give account to the king of nothing but your bones." Dolomieu, however, did not abandon himself to despair. Deprived of writing materials, he made a piece of wood his pen, and with the smoke of his lamp for ink he wrote upon the margins of a Bible, the only book he still possessed, his *Traité de philosophie minéralogique* and *Mémoire sur l'espèce minérale*. Friends entreated, but in vain, for his liberty; it was with difficulty that they succeeded in furnishing him with a little assistance, and it was only by virtue of a special clause in the treaty between France and Naples that, on March 15, 1801, he was released. On his arrival in France he commenced the duties of the chair of mineralogy at the museum of natural history, to which, after the death of Daubenton, he had been elected in January 1799. His course of lectures concluded, he revisited Switzerland. Returning thence he reached the residence of his brother-in-law at Chateau-Neuf, in the department of Saône-et-Loire, where he was seized with a fever, to which in a few days he succumbed, November 25, 1801. Dolomieu's geological theories are remarkable for originality and boldness of conception. The materials constituting the primordial globe he held to have arranged themselves according to their specific gravities, so as to have constituted a fluid central sphere, a solid crust external to this, next a stratum of water, and lastly the atmosphere. Where water penetrated through the crust, solidification took place in the underlying fluid mass, which enlarging in consequence produced rifts in the superincumbent rocks. Water rushing down through the rifts became decomposed, and the resulting effervescence occasioned submarine volcanoes. The crust of the earth he believed to be continually increasing in thickness, owing to the deposition of aqueous rocks, and to the gradual solidification of the molten interior, so that the volcanic eruptions and other geological phenomena of former must have been of far greater magnitude and frequency than those of recent times.

Lacépède, "Eloge historique de Dolomieu," in *Mémoires de la classe des sciences de l'Institut*, 1806; Thomson, in *Annals of Philosophy*, vol. xii., p. 161, 1808

DOLPHIN (*Delphinus delphis*), the common name of a species of whale belonging to the family *Delphinidae*. It usually measures from 6 to 8 feet in length, and is thickest near the centre, where the dorsal fin rises to a height of 9 or 10 inches, and whence the body tapers towards both extremities. The forehead descends abruptly to the base of the slightly flattened beak, which is about 6 inches long, and is separated from the forehead by a transverse depression. The mouth is armed with sharp, slightly curved teeth, of uniform size, varying in number from 40 to 50 on each side of either jaw, and those above locking exactly with the teeth below. The aperture of the ear in dolphins is exceedingly minute; the eyes are of moderate size and the blow-hole is crescent-shaped. The colour of the upper surface is black, becoming lighter on the flanks, and perfectly white on the parts beneath. Like many other

cetaceans, the dolphin is gregarious, and large herds are often seen following ships in full sail, and disporting themselves on the surface of the water as if delighted at the near proximity of man. In such exercises they exhibit the most remarkable agility, individuals having been known to leap to such a height out of the water as to fall upon the deck. Their aquatic gambols and apparent relish for human society have attracted the attention of mariners in all ages, and have probably given rise to the many fabulous stories told of dolphins by ancient historians. Their appearance at sea was formerly regarded as a good omen by sailors, for although it presaged a tempest, yet by thus giving warning of its approach, it enabled them, in those days when the mariner's compass was unknown, and navigators had consequently to keep within sight of the coast, to steer for a place of safety. The dolphin is exceedingly voracious, feeding on fish, cuttlefishes, and crustaceans. On the south coast of England it is said to live chiefly on pilchard and mackerel, and when in pursuit of these it is often taken in the fishermen's nets. The female brings forth a single young one, which she nurses with the greatest care. Her milk is both abundant and rich, and during the operation of suckling the mother floats in a slightly sidelong position, so as to allow of the necessary respiration in herself and her young. The dolphin was formerly supposed to be a fish, and as such was allowed to be eaten by Roman Catholics on those occasions when the use of flesh was prohibited, and it seems to have been esteemed as a great delicacy by the French. It is said to show great fondness for music, and according to the ancient fable, Arion was said to have escaped on the back of a dolphin which he had first charmed by his music. It is an inhabitant of the temperate regions of the North Atlantic and the Mediterranean Sea, and has been observed as far north as the coast of Greenland. It is much more common in English than in Scottish waters. Among the seafaring population of Britain the name "dolphin" is most usually given to the beautifully coloured fish *Coryphæna hippuris*—the dorado of the Portuguese, and it is to the latter the poet is alluding when he speaks of "the dying dolphin's changing hues"—while the true dolphin is usually spoken of as the "bottlenose" or "bottlehead." This species occurs as a fossil in the sandy downs of the French coast.

DOMAT, or **DAUMAT**, **JEAN** (1625–1696), a celebrated French juriconsult, born at Clermont in Auvergne, on the 30th November 1625. He was closely in sympathy with the Port-Royalists, was intimate with Pascal, and at the death of that celebrated philosopher was intrusted with his private papers. He is principally known from his elaborate legal digest, in four volumes 4to, under the title of *Lois Civiles dans leur Ordre Naturel Suivies du Droit Public* (1689),—an undertaking for which Louis XIV. settled on him a pension of two thousand livres. This is one of the most important works on the science of law that France has produced. Domat endeavours to found all law upon ethical or religious principles, his motto being *L'homme est fait par Dieu et pour Dieu*. An English translation of the *Lois Civiles* by Strahan, was published in 1722, and passed through several editions. Besides the *Lois Civiles*, Domat made in Latin a selection of the most common laws in the collections of Justinian. This work, however, did not appear until after his death, when it was published separately (Paris, 1700, Amsterdam, 1703) under the title of *Legum Delectus*, and was subsequently appended to the *Lois Civiles*. It was translated into English by Strahan. Domat died at Paris on the 14th March 1696.

See in the *Journal des Savants* for 1843 several papers on Domat by Victor Cousin, giving much information not otherwise accessible.

DOMBROWSKI, JAN HENRYK (1755–1818), Polish general, was born at Pierszowice in the palatinate of Cracow, August 29, 1755. He was of noble family, and his father was an officer in the Saxon army. Brought up in Saxony, he entered and for some years served in the army; but when, in 1791, the Polish Diet recalled all Poles serving abroad, he returned to his native land. Placed then under the orders of Poniatowski, he took part in the campaign of 1792 against the Russians. In 1794 he distinguished himself in command of the right wing under Kosciusko assisted in the defence of Warsaw, and renounced the scattered Polish forces after its fall. He was compelled, however, to capitulate and to surrender himself prisoner of war at Radoszyce, November 18. Suwaroff offered him a post in the Russian army, but this he declined, and for two years he lived in retirement. In 1796 the rank of lieutenant-general in the Prussian army was offered to him by the king, but this he likewise declined. He then went to Paris. The formation of a Polish legion was at this time in contemplation by the French authorities; and in January 1797 Dombrowski was formally authorized by the Government of the Cisalpine Republic to organize it. This task he executed at Milan. In command of his legion he played an important part in the war in Italy, entered Rome in May 1798, and distinguished himself greatly at the battle of Trebbia (June 19, 1799). On this occasion he narrowly escaped death, being struck by a ball the force of which was broken by a volume of Schiller which he carried with him. He next served under Saint-Cyr and Masséna; but being severely wounded he was for some time incapacitated for action. After Marengo he was intrusted by Napoleon with the organization of two new Polish legions; and at the head of the new levies he captured, in January 1801, the fortified post of Casa Bianca, near Peschiera. After the peace of Amiens he passed, as general of division, into the service of the Italian republic. Summoned by Napoleon after the battle of Jena to promote a rising in Poland, he returned there, took command of the Polish army, and distinguished himself at the siege of Dantzic (1807). He fought and was wounded at Friedland, and took an active part against the Austrians in the campaign of 1809. In the Russian campaign of 1812 he commanded a division of the great French army, and was wounded at the passage of the Beresina. He fought under General Marmont at the battle of Leipsic (1813), and in the following year returned to Poland. He was one of the generals entrusted by the emperor Alexander with the reorganization of the Polish army, and was named in 1815 general of cavalry and senator palatine of the new kingdom of Poland. He retired, however, in the following year to his estates in Posen, and employed himself in preparing for publication his *History of the Polish Legions in Italy*, which was published some years after his death. General Dombrowski died at his seat of Wina-Gora in Posen, in June or July 1818.

DOME is usually understood to mean a roof which is round or polygonal horizontally, and of which any vertical section is either a round or a pointed arch. There happen to be none of elliptical or any other section than these. But some, especially in the East, have what is called an ogival outline, convex below and concave towards the top, and these are generally called *cupolas*, though there is no real distinction. Most of the great European domes have an opening or eye at the top, on which stands a lantern, except in the Pantheon at Rome, where the eye is open. Until modern times all the domes worth notice were of masonry, i.e., stone, brick, tiles, or pots, which last were used for lightness. Probably the first large wooden dome was St Paul's, of which the construction is peculiar, the inner dome visible in the church being

of brick only 18 inches thick, except near the bottom where it grows out of a cone of the same thickness going up outside it and carrying the stone lantern, which looks right down into the church through an eye in the internal dome. Outside the cone is built a wooden dome covered with lead. The domes of St Peter's at Rome and Florence Cathedral are of two stone shells near together, and connected by some vertical ribs, and also carrying lanterns. But Wren's construction is infinitely stronger, since a cone sufficiently tied at the bottom cannot give way until it is absolutely crushed, while the bursting pressure of a weight on the top of a dome increases the bursting force enormously. St Peter's dome is cracked in several places, and held together by bands, and it is covered with lead, and therefore looks no better than St Paul's, and indeed on the whole not near so well, for various reasons which may be seen in architectural books; and the lantern is smaller in proportion. The only full mathematical investigation of the theory of domes with practical results, that we know of, is in a paper by Sir Edmund Beckett (then Mr Denison) in the *Memoirs of the Royal Institute of British Architects* of February 1871, and two shorter ones by Mr E. W. Tarn, architect, in the *Civil Engineer's Journal* of March 1868, which substantially agree, so far as they deal with the same points. The investigation is long and complicated, and can only be done approximately, because the introduction of the thickness deranges all the ordinary trigonometrical relations, and so we only give the principal results of those calculations. Some more of them are given in Sir E. Beckett's *Book on Building*. It is easy to prove by strict mathematics that the upper 52° (nearly) of a hemispherical dome would be absolutely stable, or have no tendency to fall in or burst out, without any sensible thickness, if only tied strongly enough round the base, where the tension would be $\frac{1}{3}$ of the weight of the complete hemisphere, disregarding the bonding effect of mortar and friction. The weight of a thin hemispherical shell is the same as that of a cylinder of the same height and thickness standing on the same base, and is twice that of the area which the dome covers, of the same thickness, provided that bears only a small proportion to the diameter. The weight of any zone of the dome is proportional to its height. A hemisphere of ordinary stone 100 feet wide at mid-thickness and 1 foot thick weighs about 1000 tons. It is also demonstrable that a dome spreading at the bottom a little more than a hemisphere, so as not to start vertically, and rather flattened at the top, would stand without any sensible thickness; and so would sundry other curves, and especially an inverted *catenary*, which will stand even as an independent arch without thickness, for a dome is far more stable than an arch or a barrel vault of the same thickness.

The essential difference between them is that the mathematical element of a dome is not an arch of any uniform breadth, but one whose breadth, and therefore weight, decreases upwards to nothing, being in fact a *lune* enclosed between two meridians very close together. And it was shown in the R.I.B.A. paper, and also by models exhibited, that a dome is stable with a thickness of only $\frac{1}{23}$ of its diameter, while an independent round arch or a barrel vault requires three times as much thickness, or $\frac{1}{72}$ of its diameter. Therefore a barrel vault 100 feet wide must be 7 feet thick to be stable, while a dome of that diameter need only be 27 inches; besides which, the strength of the dome can be increased to almost any extent by building in iron bands in the lower courses, while a barrel vault cannot be so helped. Bands would be of no use whatever in a dome above 52° from the top, as the pressure above that point is entirely inward, assuming it to be tied there, and from thence it gradually increases towards the bottom, where the tension is $\frac{1}{25}$ of the weight of the

hemisphere. It may seem paradoxical that it should be less there than at 52° , but the explanation is that the tension bears a higher proportion to the weight in a thin dome than a thick one, and it was an infinitely thin one which had the tension of $\cdot 3$ of its weight at 52° , and such a dome cannot be carried lower without bands. In a dome of the required thickness ties would have very little to do above 68° .

As the tension at the bottom is rather more than a fifth of the weight, a dome of proper thickness would be stable standing on a conical *drum*, with a slope inwards of about 1 to 5, or 12° , of which the tangent is $\cdot 215$, if the drum itself has foundations which cannot spread. The thickness requisite, and also the tension at the bottom, may evidently be greatly diminished by gradually tapering the dome upwards. If it is half as thick at the top as at the bottom, with the thickness increasing downwards as the height, it need only weigh $\frac{1}{10}$ of the lightest uniform dome of the same size, and only need be 20 inches thick at the bottom for 100 feet diameter.

Pointed domes are also much stronger than hemispheres, having lost the flat top which has the greatest bursting pressure. A dome generated by the revolution of an equilateral arch, or one of 60° , requires a thickness only $\cdot 0137$ diameter, or $16\frac{1}{2}$ inches for 100 feet; and one of 70° requires 20 inches. The tension at the bottom of a 60° dome is only $\cdot 15$ of its weight, which weight, however, is $1\cdot 372$ of a hemisphere on the same base, their heights being as 1.73 to 1.

For the same reason pointed domes are fittest for carrying a lantern, but they are not much benefited by tapering, having already lost the most oppressive part. The Florence dome, across the flat sides of the polygon, is about 70° of the circle of its curvature. It is shown in the R.I.B.A. paper that both in hemispherical and pointed domes the weight of the lantern they will carry varies practically as the cube of the thickness. Moreover a lanterned dome requires tying much higher up than a plain one. In short, the cone is the only proper way of carrying a stone lantern. The cone at St Paul's has a great chain round the base, which is probably superfluous, as the drum below it seems thick enough to contain the requisite slope, and visibly leans inwards besides.

Ribs inside a dome weaken more than strengthen it, as some persons imagine, unless they are themselves deep enough to be stable as independent arches, or unless they decrease in width and weight upwards like a lune, as those in the Pantheon do, which also is so enormously thick at the hanches that it has superabundant stability. Some of the Indian domes are thick enough for arches, and they have neither eyes nor lanterns. Polygonal domes may be considered as composed of a small number of widish lunes, and only differ from round ones in being rather weaker for any given thickness and size.

Domes require no wooden centring to build them on as arches do, until you get near the top, i.e., so long as each stone laid on the ring of stones below it will not slide inwards. And if they are notched to prevent sliding the whole dome may be built without centring. The dome of Mousa in Malta was so built in this century by a common mason, who must, however, have been a man of genius. There would be no difficulty in building a dome of almost any size of bricks or stones, with the help of hoop iron in all the lower courses up to about 22° from the bottom, and then less up to 52° , and higher if it has to carry a lantern. There is no masonry dome in the world wider than 142 feet. But there have been several larger iron ones, which are an easy piece of engineering, inasmuch as iron has enormous tensile strength, while stone has very little, and mortar practically none; and all the calculations

above mentioned assume the domes to be composed of narrow lunes having no lateral bond or tie; but on the other hand all the stones are assumed to go right through the thickness and not to be liable to crush at the edges. Building the lowest courses with horizontal beds, which some architects suggested, was shown to be exactly the opposite of what is mathematically required, as there would be nothing to prevent their sliding over each other, whereas the essence of dome-construction is that the lower courses should confine the upper. It is not however practically expedient to make the beds lean inwards so much as to involve acute angles of the stones, as such angles in stone will bear very little pressure. Brick domes over wells or tanks, which should always be round for strength, are usually built on mere mounds of earth for centring, and they are always of flat section, or only about the upper half of a hemisphere, and are consequently stable with very little thickness, as the earth round them forms a strong abutment.

The following inside diameters of the largest domes in the world are given in Sir E. Beckett's *Book on Building*.—

DOMENICHINO, or DOMENICO, ZAMPIERI (1581–1641), the celebrated painter, born at Bologna on 21st October 1581, was the son of a shoemaker. The diminutive form of Christian name by which he is known indicates his short stature. He was placed, when young, under the tuition of Denis Calvart, but having been treated with great severity by that master, he left him, and became a pupil in the academy of the Caracci, under Agostino. Towards the beginning of the 17th century he went to Rome, at the invitation of his fellow-pupil and intimate Albano, and prosecuted his studies under Annibale Caracci. The faculty of Domenichino was slow in its development. He was at first timid and distrustful of his powers, while his studious, unready, and reserved manners were misunderstood by his companions for dullness, and he obtained the nickname of "the Ox" (Bue). But Annibale Caracci, who observed his faculties with more attention, predicted, that the apparent slowness of Domenichino's genius would in time produce what would be an honour to the art of painting. When his early productions had brought him into notice, he studied with extreme application, and made such advance as to raise his works into a comparison with those of the most admired masters of the time. From his acting as a continual censor of his own works, he became distinguished amongst his fellow-pupils as an accurate and expressive designer, his colours were the truest to nature; Mengs, indeed, found nothing to desire in his works, except a somewhat larger proportion of elegance. That he might devote his whole powers to the art, Domenichino shunned all society; or, if he occasionally sought it in the public theatres and walks, it was in order better to observe the play of the passions in the features of the people—those of joy, anger, grief, terror, and every affection of the mind—and to commit them vividly to his tablets; thus, says Bellori, it was that he succeeded in delineating the soul, in colouring life, and calling forth heartfelt emotions, at which all his works aim. In personal character he is credited with temperance and modesty; but, besides his want of sociability, he became somewhat suspicious, and jealous of his master.

In Rome, Domenichino obtained employment from Cardinals Borghese, Farnese, and Aldobrandi, for all of

whom he painted works in fresco. The distinguished reputation which he had acquired excited the envy of some of his contemporaries. Lanfranco in particular, one of his most inveterate enemies, asserted that his celebrated Communion of St Jerome (painted for the church of La Carità towards 1614, for a pittance of about ten guineas, now in the Vatican Gallery, and ordinarily, but most irrationally, spoken of as the second or third best oil picture in the world) was an imitation from Agostino Caracci; and he procured an engraving of this master's picture of the same subject (now in the Gallery of Bologna), copies of which were circulated for the purpose of showing up Domenichino as a plagiarist. There is in truth a very considerable resemblance between the two compositions. The pictures which Zampieri painted immediately afterwards, representing subjects from the life of St Cecilia, only increased the alarm of his competitors, and redoubled their injustice and malignity. Disgusted with these cabals, he left Rome for Bologna, where he remained until he was recalled by Pope Gregory XV., who appointed him principal painter and architect to the pontifical palace. In this architectural post he seems to have done little or nothing, although he was not inexpert in the art. He designed in great part the Villa di Belvedere at Frascati, and the whole of the Villa Ludovisi, and some other edifices. From 1630 onwards Domenichino was engaged in Naples, chiefly on a series of frescoes (never wholly completed) of the life of St Januarius in the Cappella del Tesoro. He settled in that city with his family, and opened a school. There the persecution against him became far more shameful than in any previous instance. The notorious so-called "Cabal of Naples"—the painters Corenzio, Ribera, and Caracciolo,—leagued together as they were to exclude all alien competition, plagued and decried the Bolognese artist in all possible ways; for instance, on returning in the morning to his fresco-work, he would find not unfrequently that some one had rubbed out the performance of the previous day. Perpetual worry is believed to have brought the life of Domenichino to a close; contemporary suspicion did not scruple to speak broadly of poison, but this has remained unconfirmed. He died in Naples, after two days' illness, on 15th April 1641.

Domenichino, in correctness of design, expression of the passions, and simplicity and variety in the airs of his heads, has been considered little inferior to Raphael; but in fact there is the greatest gulf fixed between the two. Critics of the last century adulated the Bolognese beyond all reason or toleration; he is now regarded as commonplace in mind and invention, lacking any innate ideality, though undoubtedly a forcible, resolute, and learned executant. "We must," says Lanzi, "despair to find paintings exhibiting richer or more varied draperies, details of costume more beautifully adapted, or more majestic mantles. The figures are finely disposed both in place and action, conducing to the general effect; whilst a light pervades the whole which seems to rejoice the spirit, growing brighter and brighter in the aspect of the best countenances, whence they first attract the eye and heart of the beholder. The persons delineated could not tell their tale to the ear more plainly than they speak it to the eye. The Scourging of St Andrew, which he executed in competition with Guido at Rome [a fresco in the church of San Gregorio], is a powerful illustration of this truthful expression. Of the two works of these masters, Annibale Caracci preferred that of Domenichino. It is said that in painting one of the executioners the artist actually wrought himself into a passion, using threatening words and actions, and that Annibale Caracci, surprising him at that moment, embraced him, exclaiming with joy, 'To-day, my dear Domenichino, thou art teaching me.' So novel, and at the same time so

natural, it appeared to him that the artist, like the orator, should feel within himself all that he is representing to others." Domenichino is esteemed the most distinguished disciple of the Caracci, or second only to Guido. Algarotti preferred him to the greatest masters; and Nicolo Poussin considered the painter of the Communion of St Jerome to be the first after Raphael. His pictures of Adam and Eve, and the Martyrdom of St Agnes, in the Gallery of Bologna, are amongst his leading works. Others of superior interest are his first known picture, a fresco of the Death of Adonis, in the Loggia of the Giardino Farnese, Rome, the Martyrdom of St Sebastian, in Santa Maria degli Angeli, the Four Evangelists, in Sant' Andrea della Valle, Diana and her Nymphs, in the Borghese Gallery; and the Assumption of the Virgin, in Santa Maria di Trastevere. His portraits are also highly reputed. It is admitted that in his compositions he often borrowed figures and arrangements from previous painters. Domenichino was potent in fresco. He excelled also in landscape painting. In that style (in which he was one of the earliest practitioners) the natural elegance of his scenery, his trees, his well-broken grounds, the character and expression of his figures, gained him as much public admiration as any of his other performances. (W. M. R.)

DOMESDAY BOOK, or simply DOMESDAY, is, in its commonest use, the name applied to the *Liber de Wintonia*, or Exchequer Domesday, a very ancient record containing a survey of all the lands of England, made in the time of William the Conqueror. It consists of two volumes—a greater and a less. The first is a large folio, written on 382 double pages of vellum, in a small but plain character, each page having a double column. Some of the capital letters and principal passages are touched with red ink, and some have strokes of red ink run across them, as if scratched out. This volume contains the description of the following counties—Kent, Sussex, Surrey, Southampton, Berks, Wilts, Dorset, Somerset, Devon, Cornwall, Middlesex, Hereford, Bucks, Oxford, Gloucester, Worcester, Hereford, Cambridge, Huntingdon, Bedford, Northampton, Leicester, Warwick, Stafford, Salop, Cheshire, Derby, Notts, York, and Lincoln, together with the anomalous districts of Rutland and the land "inter Ripan et Mersham." The second volume is in quarto, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, and Suffolk. This second volume, together with the Exon Domesday, which contains the fuller reports of the western counties, Wiltshire, Dorset, Somerset, Devonshire, and Cornwall, and the *Inquisitio Eliensis*, which relates to the lands of the abbey of Ely, seems to be the original record of the survey itself, which appears in the first volume of the Exchequer Domesday in an abridged form. "In both volumes of the Exchequer Domesday," writes Mr Freeman in his *History of the Norman Conquest*, "each shire is commonly headed with a list of the chief landowners in it. The king comes first, then the great ecclesiastical, and then the great temporal proprietors, followed in many cases by the smaller proprietors lumped in classes 'servientes regis,' 'taini regis,' 'eleemosynarii regis,' and the like, the list being numbered, and forming an index to the survey itself, which follows. Lastly, in several shires come the 'Clamores,' the records of lands which were said to be held unjustly, and to which other men laid claim." Then follows the survey itself. The lands of the king or other landowner are arranged under the hundreds in which they were placed, and the necessary particulars of which the survey was to be a record are put down under each manor or other holding.

The northern shires are not described in the survey. Nor

thumberland, Cumberland, Westmoreland, and Durham are conspicuous by their absence. Lancashire does not appear under its proper name; but Furness and the northern part of the county, as well as the south of Westmoreland, with a part of Cumberland, are included within the West Riding of Yorkshire. That part of Lancashire which lies between the rivers Ribble and Mersey is subjoined to Cheshire; and part of Rutland is described in the counties of Northampton and Lincoln. The reasons which led to the omission of these northern counties from Domesday are not difficult to be understood. Durham and Northumberland had been laid waste by the merciless hand of conquest. The devastations of the Conqueror himself in the winter of 1069–1070, the various inroads of Malcolm, and the vengeance taken by Odo after the murder of Bishop Walcher in 1080, must have left very little in those districts worth the surveying. Lancashire did not then exist as a separate county. Cumberland and Westmoreland had no being as English shires,—their southern portions then formed part of Yorkshire, and they are surveyed in Domesday as such; whilst their northern portions did not become part of the kingdom of England till the reign of William Rufus, having been held by the Scottish kings as a fief ever since the grant by Edmund the Magnificent, on the final overthrow of the old kingdom of Strathclyde. The notion that the northern portions of Cumberland and Westmoreland were conquered in 1072 by William I. is derived from a careless blunder in the work of Matthew of Westminster, who has confounded William Rufus with his father.

The exact time of the commencement of this survey is variously stated. The Red Book of the Exchequer has been quoted as fixing the date at 1080; whereas the Red Book merely states that the survey was undertaken at a time subsequent to the total reduction of the island to the authority of the Conqueror. From the memorandum of the completion of the survey at the end of the second volume, it is evident, however, that Domesday was finished in 1086. Matthew Paris, Robert of Gloucester, the *Annals of Waverley*, and the *Chronicle of Bermondsey* give 1083 as the date of the record; Henry of Huntingdon places it in 1084, the *Saxon Chronicle* in 1085; Simeon of Durham, Florence of Worcester, Roger Hoveden, and Hemingford in 1086; whilst the *Ipodigma Neustrice* and Diceto state 1087 as the year.

The reason given for taking this survey, as assigned by several ancient records and historians, was that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But besides this, it is stated by others that all those who possessed landed estates now became vassals to the king, and paid him so much money by way of fee or homage, in proportion to the lands they held. According to the false Ingulphus, the survey was made in imitation of the policy of Alfred, who, at the time he divided the kingdom into counties, hundreds, and tithings, had an inquisition taken and digested into a register, which was called, from the place in which it was deposited, the Roll of Winchester. But the compilation of such a survey in the time of Alfred may be more than doubted; for, with the exception of the statement of Ingulphus, no chronicler alludes to the existence of this register, nor is any mention of it to be found in the records of the time or in those of a subsequent period. Had it been extant in the century immediately preceding the Norman Conquest, it would have prevented the necessity of giving those minute descriptions of land so common among the later of the Saxon charters. Again, the separation of counties is known to have been a division long anterior to the time of Alfred. The confusion in all probability has arisen from a similarity in the title of the two works. The survey of the Conqueror was called Domesday

Book; the register of Alfred had the name of Dome-boc; but the Dome-boc, instead of being a territorial analysis as is Domesday Book, was in reality the code of Saxon laws.

For the execution of the survey recorded in Domesday Book, certain commissioners, called the king's justiciaries, were sent into every county and shire, and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor and that of its owner, also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills and how many fish-ponds or fisheries belonged to it; the value of the whole in the time of King Edward, as well as when granted by King William, and at the time of this survey; and also whether it was capable of improvement or of being advanced in value. They were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquiries, being first methodized in the county, were afterwards sent up to the king's Exchequer. So minute was the survey, that the writer of the contemporary portion of the *Saxon Chronicle* records—"So very narrowly he caused it to be traced out that there was not a single hide or yardland, not an ox, cow, or hog that was not set down."

By the completion of this survey the king acquired an exact knowledge of the possessions of the Crown. It afforded him the names of the land-holders; it furnished him with the means of ascertaining the military strength of the country; and it pointed out the possibility of increasing the revenue in some cases and of lessening the demand of the tax-collectors in others. It was, moreover, a register of appeal for those whose titles to their property might be disputed.

So accurate has Domesday Book been considered that its authority was never permitted to be called in question; and when it has been necessary to distinguish whether lands were held in ancient demesne or in any other manner, recourse was always had to Domesday, and to it only, in order to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at Domesday, or the Day of Judgment, there could be no appeal, the name of the book is said to have been derived. Stowe indeed assigns another reason for this appellation, namely, that Domesday Book is a corruption of "*domus Dei* book," a title given it because heretofore it was deposited in the king's treasury in a part of the church of Westminster or Winchester called *domus Dei*; the name, however, is plainly English. From the great care formerly taken to preserve this survey, we may learn the estimation in which it was held. In the *Dialogus de Scaccario* it is said, *Liber ille* (meaning Domesday) *sigilli regis comes est individuus in thesauro*. It was formerly kept at Westminster with the king's seal by the side of the Tally Court in the Exchequer, under three locks and keys, in the charge of the auditor, the chamberlains, and deputy-chamberlains of the Exchequer, till in 1696 it was deposited among other valuable records in the chapter-house. It is now carefully preserved beneath a strong glass case in the Public Record Office, and can be consulted without payment of any fee.

Various local Domesdays exist, as those of York, Norwich, Ipswich, Chester, and Evesham. The most notable among them is the Domesday of St Paul's, made in 1181 by the Dean, Ralph de Diceto, and edited by Archdeacon Hale.

In 1783 Domesday Book was published in two volumes, and in 1816 a volume of indices was printed by the Record Commission, to which a very valuable "general introduction" was prefixed." During the latter year another volume appeared containing the Exon Domesday, and the Inquisitio Eliensis, already noticed; the Winton Domesday, comprising lands in Winchester between 1107 and 1128; and the Boldon Book, or Survey of the Palatinate of Durham in 1183. Within the last few years the whole of Domesday has been issued in parts, each part comprising a county, and printed by the process of photozincography, under the scholarly superintendence of Mr W. B. Sanders, one of the assistant keepers of the Public Records.

See Sir H. Ellis's *Introduction and Indexes to Domesday*, vol. i. and ii.; *Domesday Book*, illustrated by Kelham; *Descriptive Catalogue of Manuscripts relative to the early History of Great Britain*, vol. ii.; *History of the Norman Conquest*, by E. A. Freeman, vol. v.; *Our Public Records*, by A. C. Ewald. (A. C. E.)

DOMICILE, in law, may be defined generally as the place of a man's permanent abode; but a precise definition of the word is a matter of acknowledged difficulty. Its use in jurisprudence is to fix the legal rights of a person in certain cases where it is felt that the application of the law of the country to which he owes allegiance on the one hand, or of the country in which for the moment he happens to be, would be attended with inconvenience. Thus an English citizen who, for purposes of business, health, &c., has for many years permanently resided in France, has, let us suppose, died during a casual visit to Denmark. The question would arise under which of the three systems of law—English, French, or German—the validity of his will, the succession to his estate, &c., would be determined. Or, again, a French subject habitually resident in England, but not naturalized, might sue for a dissolution of his marriage in the matrimonial courts of this country, and it would be generally admitted that our courts in such a case were entitled to exercise jurisdiction, and that their decision ought to be received as determining the status of the persons concerned, just as fully as if they had been natural-born subjects of the Crown. In such cases there is a general agreement that a man's legal character, so to speak, should be determined by his domicile, rather than by his political nationality or his residence for the time being. We shall notice briefly the conditions of residence under which domicile may generally be established.

The Roman jurists defined domicile to be the place "*ubi quis larem rerumque ac fortunarum summam constituit: unde rursus non sit discessurus si nihil avocet: unde cum profectus est, peregrinari videtur: quo si redit peregrinari jam destitit.*" The general result of the definitions to be found in writers on the civil law is to make that place the domicile which may be described as the head-quarters of the person concerned, or, as it is expressed in the Code Civile, "*le lieu ou il a son principal établissement.*" But here characteristic difficulties embarrassed the civil lawyers. A man's habits of life might point equally to two places as his head-quarters. It might be impossible to say which of them was the principal seat of his business. Which of the two in such a case is the legal domicile. Or can the same person at the same time have two domiciles? The two essential things are residence and the intention of remaining. Story's definition is, "That place is properly the domicile of a person in which his habitation is fixed without any present intention of removing therefrom." Change of residence not intended to be permanent would not create a new domicile. Cases will readily suggest themselves in which the question of intention may be surrounded with difficulties.

The following summary follows the general rules laid down by Story for determining the domicile of a person

(*Conflict of Laws*, sec. 46). The child takes the domicile of the father, except in the case of an illegitimate child, which takes the domicile of the mother. Minors follow the changes of the father's domicile; and a married woman follows the domicile of her husband. The place of residence is *prima facie* the domicile; and when a person removes to another place with the intention of making it his permanent residence, that place becomes his domicile. When a person has removed to another place with the intention of remaining there for an indefinite time, that is his domicile, though he may have a general intention of returning at some future time. In general the domicile of a married man is the place where his family permanently resides, even though he habitually transacts his business elsewhere. When a married man has two places of residence, that will be his domicile "which he himself selects or describes or deems to be his home, or which appears to be the centre of his affairs, or where he votes or exercises the rights and duties of a citizen." An unmarried man's domicile is where he transacts his business or exercises municipal duties or privileges. Compulsory detention will not create a domicile. A domicile once established remains until a new one has been acquired,¹ but ambassadors resident in a foreign country retain their domicile of nationality.

To these general rules may be added some of the principles laid down in recent cases by the English courts. The distinction between the question of domicile and that of naturalization or allegiance is clearly pointed out in *Haldane v. Eckford* (*Law Reports*, 8 Equity, 631) where it is said that to effect a change of domicile it is not necessary that a man should do all in his power to divest himself of his original nationality (*exuere patriam*), it being sufficient that there should be a change of residence of a permanent character voluntarily assumed. And in *Udny v. Udny* (*Law Reports*, 1 House of Lords, Scotch Appeals) Lord Westbury said: "To suppose that for a change of domicile there must be a change of natural allegiance is to confound the political and civil status, to destroy the distinction between *patria* and *domicilium*." So the lord chancellor: "A man may change his domicile as often as he pleases, but not his allegiance." In the British empire, composed as it is of communities having each its own system of law, there may be numberless domiciles under one allegiance. In the first of the cases above mentioned the question was as to the domicile of a testator, whose domicile of origin was Scotch, who was a servant of the East India Company for thirty-three years, and who on leaving India went to Jersey, where he lived continuously for twenty-five years till his death. The Scotch domicile reverted on his leaving India, but was held to have been lost by the residence in Jersey, where a new domicile was acquired. This is a fair sample of the cases which frequently arise in British courts on the question of domicile. In the second of the cases mentioned above it was held to be "a settled principle that no man shall be without a domicile, and to secure this end the law attributes to every individual as soon as he is born the domicile of his father, if the child be legitimate, and the domicile of his mother, if the child be illegitimate. This is called the domicile of origin, and is involuntary. It is the creation of the law, not of the party. It may be extinguished by act of law, as for example by sentence of death or exile for life, which destroys the *status civilis* of the criminal; but it cannot be destroyed by the will and act of the party. Domicile of

¹ Some Roman jurists, however, maintained that a man might be without any domicile at all, as for example when he has definitely abandoned his old domicile, and is travelling in search of a new abode. It is said that, when a domicile different from that of birth has been acquired and is abandoned, the domicile of birth reverts the moment the other is given up. "The native domicile easily reverts."

choice is the creation of the party. When a domicile of choice is acquired, the domicile of origin is in abeyance, but is not absolutely extinguished or obliterated. When a domicile of choice is abandoned, the domicile of origin revives, a special intention to revert to it not being necessary. A natural-born Englishman may domicile himself in Holland, but if he breaks up his establishment there and quits Holland, declaring that he will never return, it is absurd to suppose that his Dutch domicile clings to him until he has set up his tabernacle elsewhere."—*Per Lord Westbury*. These extracts, it will be seen, state even more strongly than the corresponding rule adopted by Story the position that the original domicile differs from an acquired domicile, in being suspended rather than destroyed by the acquisition of a new domicile. One of the law lords in *Udny v Udny* even finds fault with Story's use of the phrase "to reacquire a native domicile." The native domicile is not reacquired but restored *ipso facto* by the abandonment of the acquired domicile.

The intention necessary to effect a change of domicile may be illustrated by the following cases. In the case of *Douglas v Douglas* (12 *Equity*, 617), R—, son of a domiciled Scotchman, entered the Home Office, London, in 1792, remained till 1802, thereafter having married an English lady, lived in England in hired houses, and finally settled in Scotland and died there. It was held that he had not lost his domicile of origin. The testator in the case, the son of R—, was born in London in 1803 during a visit of his parents to London, lived from the age of thirteen with his parents in Scotland, paying occasional visits to England till his mother's death in 1857, after which he let his family estate in Scotland, and lived chiefly in England in hired houses. It was held that his domicile was Scotch. The intention required to create a new domicile is an intention to settle in a new country as a permanent home, and this is sufficient without any intention to change civil status. In another case (*Brunel v. Brunel*, 12 *Equity*, 298), where a French subject had established himself in business in England, and resided there continuously for thirty years, making only occasional visits to France, but had refused to take out letters of naturalization on the ground that he might return to France, and would not give up his status as a French citizen, it was held, notwithstanding, that he had lost his domicile of origin, and had acquired an English domicile.

The effect of domicile on the rights and duties of parties is even more difficult to state. Continental jurists draw a distinction between personal and real laws,—the former being supposed to fix the legal character of the person and accompany him wherever he may be, the latter dealing with things only. In matters covered by the former, therefore, the domicile prevails; while things are governed by the law of the place in which they are. If the distinction were maintainable it would still be of little use in fixing the extent of the operations of the law of domicile, because one large class of real laws, that dealing with movables, is universally admitted to be governed by domicile; while a large but undefined class of personal laws would certainly not be acted on by foreign states, *e.g.*, where the law of domicile fixes with incapacity persons professing a religion contrary to that established by the state. There is no uniformity of practice or opinion on this point in modern jurisprudence. Story considers the following to be the best established principles in England and America on the point of personal capacity or status:—

1 The capacity, state, and condition of persons according to the law of their domicile, will generally be regarded as to acts done, rights acquired, and contracts made in the place of their domicile touching property situate therein. If valid or invalid there, they will be valid or invalid everywhere. 2 As to acts done, &c., in other countries touching the property therein, the law of such

countries, as to capacity, &c., and not the law of domicile, will generally prevail. Thus "in questions of minority or majority, competency to marry, incapacities incident to coverture, guardianship, emancipation, and other personal qualities and disabilities," the *lex loci contractus aut actus*, and not the *lex domicilii* ought to prevail, *e.g.*, if a person over 21 but under 25 years of age has his domicile in a country which fixes majority at 25, he may make generally a valid contract, even of marriage, in a country which fixes majority at 21. 3 Personal disqualifications not arising from the law of nature, especially such as are penal, as disqualifications for heresy, popish recusancy, &c., are not enforced in any other country. The refusal of non-slaveholding States to recognise the status of slavery is an example.¹ 4 Questions of legitimacy are generally to be decided by the law of the place where the marriage was celebrated. When issue born before marriage may by the law of the country of their birth be legitimated by the subsequent marriage of the parents, such legitimacy would be recognized in other countries. (But see *BASTARD AND MARRIAGE*).

The operation of the law of domicile is most free from doubt in questions touching personal or movable property. Real property is governed by the *lex loci*, but personal property has in law no locality. On this point English law is now substantially in harmony with Continental jurisprudence. The principle that personal property is subject to the law of the owner's domicile is fully recognized in the distribution of the estate of a person deceased, whether with or without a will. The capacity of a person to make a will, the validity of the will, and its effect, are to be determined by the law of his actual domicile in the case of movable property. In the case of real property, on the other hand, these questions must be decided by the law of the country in which it is situated. It was doubted by Story whether a will valid according to testator's domicile at the time of its execution would be affected by a subsequent change of domicile. A recent case (*Lynch v. Government of Paraguay*) decided that personal property in England is governed by the law of testator's domicile at the time of his death. In this case the testator, a domiciled Paraguyan, died leaving personal property in England; and between his death and the application for probate a decree of the Government of Paraguay declared that all the property of the deceased, wherever situated, was the property of the state of Paraguay. The court, nevertheless, held that the property in England must be governed by the law of Paraguay as at the time of the death (2 *Probate and Matrimonial Cases*, 268). So in cases of intestate succession, the law of the actual domicile of the intestate at the time of his death governs his personal property everywhere. The persons entitled, the proportions in which they are to take, &c., must be settled by the law of the domicile, however different that may be from the law of the country in which the goods are.

The following statutes relating to the effect of domicile on wills were passed in 1861.—

24 and 25 Vict. c. 114 Wills made out of the United Kingdom by British subjects (whatever may be the domicile of such person at the time of making the same or at the time of death) shall, as regards personal estate be held to be well executed, if the same be made according to (1), the forms required by the law of the place where the same were made, or (2), the place where such person was domiciled when the same were made, or (3), by the laws in force in that part of her Majesty's dominion where he had his domicile of origin. Wills made by any British subject (whatever may be his domicile) shall, as regards personal estate, be well executed if they are according to the forms then required in that part of the United Kingdom in which they are made. No will or other testamentary disposition shall be held to be revoked or become valid, nor shall the construction thereof be altered by reason of any subsequent change of domicile.

21 and 25 Vict. c. 121 recites that by the operation of the law of domicile the expectation and belief of British subjects dying abroad with regard to the distribution of their property are often defeated, and enacts that when a convention has been made between

¹ When the foreign law which would otherwise operate as *lex domicilii* is repugnant to the moral principles of the country in which it is sought to be enforced, the *lex domicilii* would not be allowed to prevail.

Her Majesty and any foreign country, it may be declared and shall be enacted that no British subject dying in such country shall be deemed to have acquired a domicile therein, unless he has been resident in such country for one year previous to death, and has made a declaration in writing of his intention to become domiciled; and British subjects so dying without having so resided and made such declaration shall be deemed for all purposes of testate or intestate succession as to movables to retain the domicile he possessed at the time of going to reside in such foreign country. Similar exemptions are conferred on the subjects of the foreign state dying in Great Britain or Ireland. But the Act does not apply to foreigners who have obtained letters of naturalization in any part of Her Majesty's dominions. (E. R.)

DOMINIC, Sr, founder of the Dominican order of monks, was born at Calahorra, a village of Old Castile, in 1170. His family name is said to have been Guzman, an illustrious name connected with many of the most honourable families in Spain. Little is known of his father and mother, but in the mediæval legends his birth is surrounded with portents indicative of his future greatness. His mother dreamed she gave birth to a boy with a torch in his mouth, which set the world on fire. At his baptism a new sign was given. A starry radiance encircled the baptismal font. His followers delighted to recognize a similar radiance in his countenance, which drew all hearts to him. His childhood gave evidence of his future devotion and self-denial. He used to creep from his bed and prostrate himself on the hard boards. At seven years of age he quitted the paternal home for the house of his uncle, who was a churchman, and gave him his first lessons in divine things. At fifteen he went to the university of Palencia, afterwards translated to Salamanca, where it attained reputation as the most famous university in Spain. He applied himself to letters and philosophy, but above all to theology,—opening his mind, according to one of his biographers, to the true knowledge, and his ears to the doctrines, of Holy Scripture. Two stories are told of him at this time, showing the intensity of his character, and indicating the future zealot in behalf of religion and the church. He sold his clothes to feed the poor in a time of famine, and, to a woman who complained that her brother had been made a slave by the Moors, he offered himself to be given in exchange. His career as a student is obscure. He appears to have remained at the university for about ten years, and it is only in 1195, when he was twenty-five years of age, that he begins to emerge into notice. He is then one of the canons of Osma, under the guidance of a new and zealous bishop, whose heart was full of extending the power of the church and reforming its abuses. He gradually became known by his fervour as a preacher and the severity of his austerities, although it was still nearly ten years later before the opportunity came for him to show his true character and abilities. In 1203 the bishop of Osma was delegated to negotiate the marriage of Alphonso VIII of Castile with a Danish princess, and for this he undertook a journey to Denmark with Dominic as his companion. Accustomed to the obedience and reverence everywhere paid to the clergy in Spain, a very different spectacle presented itself to them as soon as they crossed the Pyrenees, and found themselves in the plains and cities of Languedoc. There a new spirit—half poetical and half spiritual—had sprung up in opposition to the church. The Provençal poets found much of their inspiration in a prevailing excitement at the worldly vices and corruptions of the clergy, as well as in the chivalric loves and gaieties of their time. And in addition to the poets there had arisen in this interesting and beautiful country multitudes of preachers of a new, more simple, and more liberal faith. Peter de Brneys and Henry the Deacon became the organs of popular indignation against the superstitious observances which the priests everywhere encouraged,—the worship of the cross, transubstantiation, prayers, alms, and oblations

to the dead, and even infant baptism,—for, as in all such cases of popular movement, the church was attacked not merely in its abuses but in its essential rites and its very existence. The "Poor Men of Lyons" rejected the whole church system, and permitted women to officiate at the altars. The "Paulicians," a sect of Manichæans surviving from the 5th century, had spread from the East through the Greek provinces of Sicily and Italy, and settled amongst the other elements of disturbance in the south of France. "It was discovered," as Gibbon says (c. 54), "that many thousand Catholics of every rank and of either sex had embraced the Manichæan heresy;" and the flames consumed twelve canons of Orleans supposed to be tainted with the heresy. "The same vicissitudes of martyrdom and revenge as had been displayed in the East were repeated in the 13th century on the banks of the Rhone." The result of all was a state of heretical insurrection and confusion sufficiently startling to men like St Dominic or even St Bernard, who has left us a description of what he himself observed—"Churches without people, the people without priests, priests without respect, Christians without Christ, holy places denied to be holy, the sacraments no longer sacred, and holy days without their solemnities" (Quoted by Milman, *Hist. of Latin Christianity*, iv. 178).

In such a country, and in such a state of things, St Dominic found his mission as a champion of the church and a preacher of Catholic truth. Painfully impressed by what he saw on his journey to Denmark, he was so aroused by the spectacle of abounding heresy on his return that he resolved to devote himself to the conversion of the inhabitants, and the revival of the church in a land which appeared to him so given over to evil. The Pope had sent legates thither for the correction and repression of the heretics, but after a year's labours they had met with no success, and were on their way back to report the failure of their mission at Rome. Dominic met with them on his journey, and, struck at once by their splendid retinue and their failure, he exclaimed,—“How can you expect success with all this secular pomp? These men cannot be touched by words without corresponding deeds. The heretics deceive them by their simplicity. You must throw aside all your splendour, and go forth, as the disciples of old, barefoot, without purse or scrip, to proclaim the truth.” He acted without delay on his own principle, and betook himself to the profession of a mendicant preacher. Even the legates were shamed for a time to follow in the wake of the enthusiastic Spaniard. But their enthusiasm did not last long, and Dominic was left alone in his self-denying labours.

It is difficult to describe with any fidelity the character of St Dominic's career, which his mediæval biographers have enveloped in a haze of miraculous exaggeration. Apparently at first he confined himself in the main to moral and intellectual influences, preaching against the heretical errors, and inviting the heretics to conferences and reasonings. His modern biographer, Lacordaire, has even ventured to compare this early phase of his work with St Paul's conferences with the Jews, and St Augustine's expostulations with the Donatists and Manichæans. His arguments were of course powerfully enforced by miraculous tokens when otherwise likely to fail of their purpose. Wherever he moved the glory of the supernatural moved with him. Signs and portents, most of them too trivial and absurd for mention, gave emphasis to his preaching and triumph to his mission. But withal the success that awaited him as a preacher was disappointing; and the flames of war, kindled by the growing antagonism of the sects and the church, and fomented by the rival ambitions which are always at hand to make use of the fury of religious passion, soon swept over the country, and hid from

view the figure of the missionary and the preacher. It was, as Milman says, a stubborn generation, which, besides preaching, argument, and miracles, needed the sword of Simon de Montfort to cure it of its heresies. The atrocious crusade known as the Albigensian war, the violent incident and picturesque display of character on both sides, the pleasant, vacillating, and humiliated Count Raymond, the intrepid and bloodthirsty Montfort,—all belong to history rather than to the life of Dominic. What part he really played in the war evades clear historical judgment. Did he share in its atrocities, as religious zealots in similar cases have often done, or did he mourn the interruption of his peaceful labours of conversion, and preach moderation to the conquerors, as well as penitence to the heretics? Facts fail us in the matter. All that is known is that he remained through all the friend of De Montfort, and obeyed the call to bless the marriage of his sons and the baptism of his daughter. This implies that the darker features of the crusade, and the conduct of its leader, awakened no such horror in him as they ought to have done, and when to this is added the glory (!) claimed for him of instituting the Holy Inquisition, the light which is thus thrown upon his character is far from pleasing. It is in no spirit of apostolic mildness, certainly, that he at last left the country in 1217, after the death of De Montfort. "For many years," he says, "I have spoken to you with tenderness, with prayers, and tears, but, according to the proverb of my country, where the benediction has no effect the rod may have much. Behold now we rouse up against you princes and prelates, nations and kingdoms, and many shall preach by the sword." This was a poor gospel for a people already decimated by the armies of the church, and the preacher of it was certainly no apostle of peace. Full of enthusiasm, of eloquence, of dogmatic zeal, with a genius for combination and the great power of inspiring devotion in his followers, Dominic fails in the higher virtues of patience, magnanimity, reasonableness, and moderation. He is a prince of the church, but not a saint save in its official calendar.

On leaving Languedoc Dominic repaired to Rome, and spent the remainder of his life in the organization of his order, which received the papal sanction in 1216, and which, under his generalship, had extended in the course of five years throughout most of the countries of Europe. He died at Bologna in 1221, in the fifty-first year of his age. See DOMINICANS.

(J. T.)

DOMINICA, in French DOMINIQUE, a British West India island, the largest in the Leeward group of the Lesser Antilles, lying between the French islands of Martinique and Guadalupe, 24 miles north of the former and about the same distance south of the latter, at the intersection of 15° 30' N. lat. by 61° 30' W. long. It has a length of 29 miles with a maximum breadth of 16, and its area is estimated at 291 square miles. The longer axis is formed by a chain of mountains, which attains in some parts a height of upwards of 5000 feet, and gives the whole island a strongly marked profile and great irregularity of surface. The results and symptoms of volcanic activity are abundant, in the shape of solfataras, emissions of subterranean vapours, and hot springs, and in the southern part of the island there exists a boiling lake of unascertained depth, in which the water is frequently projected 3 feet or more above the surface by the force of the ebullition. Besides a large number of minor rivulets, upwards of thirty streams of considerable size might be mentioned, and this abundance of natural irrigation develops great fertility in the rich volcanic soil. The hills are in many parts covered with valuable timber trees of the kinds commonly found in the West Indies, and the sugar-cane, coffee, cocoa, cotton, indigo, oranges, plantains, and arrow-root are grown in the

lowlands. The island is botanically remarkable for the great number of peculiar species which it possesses in comparison with the poverty in this respect of Guadalupe, Martinique, Montserrat, and Antigua: as many as 24 are mentioned by Grisebach. Game is abundant; the fisheries on the coast are productive; and large quantities of honey and wax are furnished by the wild bees, which were originally introduced from Europe. The coast of the island are not much indented, and the only anchorages of importance are Prince Rupert's Bay and Roseau, both on the west side. The total tonnage of the ships that annually enter and clear amounts to 18,018 tons, according to the average of the fifteen years from 1860 to 1871 inclusive; and of this total only 3712 tons belong to foreign vessels. The imports in 1874 were valued at £56,714, and the exports of the same year at £67,720,—being a decrease since 1860 of £11,087 and £12,738 respectively. Since 1872 Dominica has formed part of the colony of the Leeward Islands, and sends its representatives to the general legislative council; but at the same time it retains its lieutenant-governor or president, a separate treasury, and its local legislature, consisting of seven elective members and seven nominees of the crown. In 1874 its public revenue amounted to £15,022, its expenditure to £17,456, and its debt to £4813. In common with the Virgin Islands it has attained complete religious equality by the abolition of the salaries paid from the public funds to the clergymen of the Church of England, who had a much smaller portion of the population under their jurisdiction than the Roman Catholic priests. Of the Carib aborigines there are no representatives; and the present inhabitants, numbering, according to the census of 1871, 27,178, consist mainly of descendants of the former negro slaves, with a certain number of Spanish and English families. The capital is Roseau, or Charlotteville, a fortified port near the southern end of the island, with about 5000 inhabitants. Dominica was so named on its discovery by Columbus in 1493, in commemoration of the date, which happened to be Sunday (*Die Dominica*) the 3d of November. It was ceded to England by France at the Peace of Paris in 1763, was captured by the French in 1778, regained by the English in 1783, again seized by the French in 1802, and finally surrendered to Britain in 1814. It was in the neighbouring sea that Rodney obtained his victory over Count de Grasse in 1782.

DOMINICANS, the name by which the disciples of St Dominic became known. The Dominican order was founded, as stated in the article on the founder, in 1216 by a bull of Honorius III. It conformed to the general rule of the Augustinians, but further embraced a rule of absolute poverty or mendicancy, in addition to the usual vows of chastity and obedience. Its members were supposed to be exclusively devoted to preaching and public instruction, and were described as mendicant or preaching friars. The order held its first chapter in the year 1220 at Bologna, under the presidency of its founder. It adopted as its insignia within the cloister a white robe and white hood, to which it added outside a black cloak, hence the popular name of black friars by which the Dominicans became known in England. The novitiate was for a year, and candidates were mainly recruited from the schools founded by the order, which became the nurseries of great preachers and great theologians. The order speedily extended itself through the whole Christian world, and popes, cardinals, and learned doctors sprang from it in numbers. Its preachers and teachers addressed all classes, invaded "the high places of the human intellect," and were soon found, as Milman says, "disputing in the universities of Italy and Germany, in Cologne, Rome, and Oxford. Before long they were to claim two of the

greatest luminaries of the prevalent philosophy, Albert the Great and Thomas Aquinas."

DOMINIS, MARCO ANTONIO DE (1566-1624), celebrated as a theologian and natural philosopher, was born in the island of Arbe, in 1566. He was educated in the order of the Jesuits at their college at Loretto, and afterwards studied at the university of Padua. He was employed for some time by the Jesuits as a teacher of rhetoric and mathematics, but he did not join the order. In 1596 he was appointed to the bishopric of Segni, and in 1602 he was raised to the archbishopric of Spalatro. His endeavours to reform the church soon after made him obnoxious to the papal authorities, and he was compelled to leave his native country. Having become acquainted with Bishop Bedell, whilst the latter was chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he communicated to that prelate his treatise *De Republica Ecclesiastica*, which was afterwards (1617, 1620) published at London, with Bedell's corrections. The main argument of the work was directed against the superiority of the bishop of Rome to other bishops. He came to England with Bedell, where he was received with great respect, and preached and wrote against the Roman Catholic religion. In 1619 he published at London Father Paul's *History of the Council of Trent*, with a dedication to King James. He was favourably received by the king, who bestowed on him the deanery of Windsor and other ecclesiastical preferments. But on the promotion of Pope Gregory XIV., who had been his school-fellow and old acquaintance, he was deluded by Gondomar, the Spanish ambassador, into the hopes of procuring a cardinal's hat, and thus of proving an instrument of great reformation within the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received; but he afterwards wrote letters to England recanting his recantation, and, these being intercepted, he was imprisoned by Pope Urban VIII., and died in 1624. There were suspicions that he had been poisoned. Being convicted of heresy after his death, his body was exhumed and burned, and the ashes were thrown into the Tiber. He is believed to have been the first to promulgate a true theory of the rainbow in a tract *De radiis visus et lucis in vitris perspectivis et iride* (Venice, 1611).

DOMITIAN (52-96). Titus Flavius Domitianus, the second son of Titus Flavius Vespasianus and Flavia Domitilla, twelfth of the Cæsars, and third of the Flavian dynasty, was born at Rome, 24th October 52 A.D. He enjoys an evil prominence as the only tyrant among the succession of good and just princes from Vespasian down to Commodus. According to Suetonius, he was brought up in squalor and ignorance, and led a degraded and miserable youth; but it is hardly credible that so good a prince and so indulgent a father in all his other acts should thus have neglected his son's education, and the story of his scandalous youth was more probably invented to suit his after life. When Vespasian was proclaimed emperor, Domitian escaped with difficulty from the burning temple of the Capitol, and lay in hiding from the Vitellians till his father's party proved victorious. After the fall of Vitellius he was saluted as Cæsar, or prince imperial, by the troops, obtained the city prætorship, and was intrusted with the administration of Italy till his father's return from the East. Intoxicated by this sudden rise from obscurity, he grossly abused the power committed to him, and conducted himself more like a Turkish pasha than the son of a sturdy Sabine soldier. Such were the airs of authority he assumed that Vespasian, as the story goes, wrote in irony to thank him for not having dismissed his own father. Certain it is that though in his father's lifetime he several times filled the office of consul, and after his death was nominally the partner in the empire with his brother, yet he never took

any part in public business, but lived in great retirement, devoting himself to a life of pleasure and of literary pursuits till he succeeded to the purple. The death of Titus, if not hastened by foul means, was at least eagerly welcomed by his brother. His succession (13th Sept 81) was unquestioned, and it would seem as if, when his ambition was sated, and before his fears were aroused, he intended, as far as his weak volitions and mean abilities would allow, to govern well. Like Augustus, he attempted a reformation of morals and religion. As chief pontiff he inquired into the character of the vestal virgins, three of whom were found guilty, while in the case of one the awful penalty of a living entombment was revived. He enforced the laws against adultery, mutilation, and the grosser forms of immorality. He forbade the public acting of mimes. He erected many temples and public buildings and restored the temple of the Capitol, on the gilding of which, if Plutarch is to be believed, he expended 12,000 talents, or nearly two and a half millions of our money. He passed many sumptuary laws, one of which is noticeable as showing the increasing dearth of corn, which was now grown mainly by the wasteful and inefficient process of slave labour. An edict was issued forbidding the withdrawal of arable land from the plough, and reducing existing vineyards by one half. Finally, he took a personal share in the administration of justice at Rome, and exercised a jealous supervision over the governors of provinces.

Such public virtues counterbalanced in the eyes of the people all his private vices, gross and glaring as they were from the first. Former emperors had been deified after their death, but Domitian was the first to arrogate divine honours in his lifetime, and cause himself in public documents to be styled *Our Lord and God*. Doubtless in the poets (such as Martial, who calls the emperor's minion the Ganymede of our second Jove) this deification was nothing but fulsome flattery, but in the case of the provincials it was a sincere tribute to the impersonation of the Roman Empire, as the administrator of good government, and the peacemaker of the world. Even when Rome and Italy felt his heavy hand, and smarted beneath his proscriptions and extortions, the provinces were undisturbed. Though he took the title of emperor more than twenty times, and enjoyed at least one triumph, his achievements as a general were insignificant. His campaign in 83 against the Chatti was "a mere summer promenade," in Dacia (87) he received a severe check, and the peace concluded with this nation in 90 was due to the victories of his lieutenant Julianus. Juvenal hints that the flaxen-haired Germans who figured in his triumph were purchased slaves. His jealousy was provoked by the successes of Agricola in Britain, and the conqueror of Galgacus and the hero of the battle of the Grampians was recalled to Rome (84) in the midst of his conquests, condemned to retirement, and, as Tacitus is inclined to believe, removed by poison.

The revolt of Antonius Saturninus, the commander of the Roman forces in Upper Germany (93), marks the turning point in his reign. By a fortunate rising of the Rhine, which prevented his barbarian allies from coming to his assistance, and by the vigour of Norbanus, it was speedily crushed; but the fears of the emperor once aroused seem never again to have slept. A proscription as bloody as that of Sulla followed, and no man of eminence could feel his life safe. Before this he had sought out victims to gratify his cupidity and replenish his exhausted treasury. Now he struck at all that was conspicuous for talent or virtue, glutted himself with the blood of the Lamæ, and sentenced to death his own cousin and nephew by marriage, Flavius Clemens. A conspiracy among his own freedmen—set on foot, it is said, by his wife, who knew her own life to be threatened—cut short his career of tyranny and

blood-shed. He was stabbed in his bedroom by a freedman of Clemens named Stephanus, 18th Sept. 96. Had Domitian died after as short a reign as his brother he might have left behind him as fair a name, and the interesting problem for the historian is to connect the two portions of his reign, and account for the double part he played. Like Hamlet he was born to a position which he felt himself unequal to fill. So long as the popularity which he inherited from his brother lasted, and he felt himself secure on his throne, he carried on the traditions of his father's government, denounced delators, and administered even justice. After his unsuccessful campaign and the conspiracy of his general, he was seized with the common disease of absolute monarchs, the fear of assassination and distrust of all around him. The last three years of his reign witnessed the awful spectacle of the acts of a madman endowed with unlimited power.

DON, anciently TANAI, a river of European Russia, which ranks immediately after the Volga and the Dnieper. It rises in the Iruu lake, a small basin in the government of Tula, which also sends a portion of its waters to the Volga by means of the Sbat, a tributary of the Upa; its course has a general southern direction through the governments of Riasan, Tamboff, Orloff, Voronesh, and the Country of the Don Cossacks; its total length, inclusive of its various windings, is 1325 miles; and its drainage area is calculated at 170,000 square miles. The Iruu lake lying 586 feet above the level of the sea, the average fall in the river is about 5½ inches to the mile. In the upper division of its course, which may be regarded as extending to the confluence of the Voronesh, the Don flows for the most part through a low-lying and fertile country, though in the government of Riasan its banks are rocky and steep, and in some places become even precipitous. The strata which it traverses belongs to the Devonian formation. In the middle division, or from the mouth of the Voronesh to the point when it makes its nearest approach to the Volga, it cuts its way to the S.E., for the most part through Cretaceous rocks, which in many places rise on either side in steep and elevated banks, and at intervals encroach on the channel. After passing Kachalinskaya it turns to the S.W., and maintains this direction till it falls into the Sea of Azoff, the first part of this division being still in the Cretaceous formation, but the latter part lying in an Upper Tertiary district. A short distance below the town of Rostoff it breaks up into several channels, of which the largest and most southern retains the name of the river, while the others are known respectively as the Mertvi Donetz, the Mokraya Koloncha, and the Staraya Kuterna. Before it receives the Voronesh, the Don has attained a breadth of from 500 to 700, or even in a few places 1000 feet, while its depth varies from 4 to 20 feet, by the time it has reached its most eastern point, the depth has increased to from 7 to 50 feet, and the ordinary breadth to from 700 to 1000 feet, with an occasional maximum of 14,000 feet; in the lowest division the depth is frequently 70 feet, and the breadth in many places 1800 feet. Shallow reaches are not uncommon, and there are at least seven considerable shoals in the south-western part of the course. The river can be used for rafts as far up as the confluence of the Sosua; it becomes navigable after the addition of the Voronesh and has four regular stations for traffic at Vilkoft, Pavloff, Masloff, and Mamou, in the middle part of its course, but partly owing to obstructions of the channel, and partly to the scarcity of ship-timber in the Voronesh government, it does not attain any great importance as a means of communication till it reaches Kachalinskaya. From that point, or rather from Kalatch where the railway from the Volga has its western terminus, the traffic is very extensive, and is carried on, not only by a variety of small

river craft, but also by a regular system of steamboats. Of the tributaries of the river, which are between 30 and 40 in number, the Voronesh, the Khoper, the Medvieditza, and the Donetz are navigable,—the Donetz having a course of 678 miles, and affording during high water a passage to the government of Kharkoff. The lower section of the Don is subject to two annual floods, of which the first, known as the *cold water*, is caused by the melting of the snow in the country of the Don Cossacks, and the second, or the *warm water*, is due to the same process taking place in the region drained by the upper parts of the river. About the middle of June (o.s.) the subsidence sets in with great rapidity, in August it is very low water, and navigation almost ceases, but occasionally after the September rains the traffic with small craft is again practicable. During the last hundred years there have been five floods of extraordinary magnitude,—namely, in 1748, 1786, 1805, 1820, and 1845. The river is usually closed by ice from November or December to March or April, and at rare intervals the freezing takes place in October. At Aksai it remains open on the average 250 days in the year, at the mouth of the Medvieditza for 239, and at Novo-Cherkassk for 246.

DON COSSACK COUNTRY (in Russian, *Donskago Voiska Zemlya*, the Land of the Don Army), the south-west portion of European Russia, situated in the basin of the Don, and bounded in part by the Sea of Azoff. Its area, according to the military survey, is 59,650 square miles, or 135,761 square versts, but according to Schweizer 62,574 square miles, or 142,401 square versts. The most of the surface consists of an irregular steppe broken in some places by undulating elevations or conical hills, and traversed by the channels and ravines of the numerous tributaries and sub-tributaries of the principal river. The district to the north is especially flat, forming in fact, as is shown by the characteristics of its flora, a part of the great Aralo-Caspian depression. Cretaceous formations appear throughout the whole "country," Tertiary and Carboniferous formations especially to the south of the Donetz. Coal and anthracite are found in considerable abundance in several places, and iron ore occurs near the Miuss, the Donetz, and the Khoper. Limestone, chalk, and slate are common; and salt is obtained from various lakes. The upper soil is in general black earth, the subsoil usually clay. Agriculture is still in a backward state owing to the military prejudices of the Cossacks; but the virgin fertility of the ground, and the proximity of such seaports as Taganrog and Rostoff conduce greatly to its development. Wheat is the most generally cultivated cereal, but rye is pretty largely grown in the northern and millet in the southern districts. Flax and hemp have been introduced, and maize is sown in the gardens. Stock-rearing is extensively prosecuted: in 1860 there were about 373,000 horses, 991,000 cattle, and 2,242,000 sheep. The horses show a mixture of various Asiatic strains, those of the southern districts being the best. The cattle are usually of Calmuck or Tatar race, but sometimes of Hungarian or Dutch; and the sheep are, with slight exception, Russian, Calmuck, or Wallachian. The land of the Don Cossacks was divided in 1802 into the following seven districts—Cherkassk, First Don, Second Don, Ust-Medvieditzki or Mouth of the Medvieditza, Khoper, Donetz, and Miuss; and in 1806 a new district, or *okrug*, was formed of the nomadizing Calmucks. The six first-mentioned are divided into *stanitzas*, to each of which belongs a definite territory; the Miuss district is occupied by regular landholders; and the Calmucks are arranged according to hundreds, or *sotnias*. The population in 1858 of the whole *Zemlya* was 896,870, and in 1867, 1,010,135. Novo-Cherkassk is the seat of government and the residence of the directing ataman of the Don army. In ancient times the Greeks had a colony at Tanais on the Sea of Azoff, and

various factories on the Don; and the Scythians and Sarmatians nomadized throughout the district. Afterwards came the Alans, the Huns, the Ugrians, the Bulgarians, the Avars, and the Khazars, the last even building the small town of Sarkel, then followed the Pechenegs, the Polovians, and finally the Tatars, whose power was gradually diminished during the 16th and 17th centuries by the encroachments of the Russian Cossacks.

DON JUAN, a legendary personage whose story, originating in Spain, has found currency in various poetic and dramatic forms throughout most of the countries of Europe. The character has a certain historic basis in so far as it is localized at Seville in the time of Peter the Cruel, or, according to another version, of Charles V. Don Juan, who belonged to the illustrious Tenorio family, lived a life of unbridled licentiousness. In an attempt to abduct Giralda, daughter of the governor of Seville, he was encountered by her father, whom he subsequently killed in a duel. In mocking defiance of the spirit world, in whose existence his sensuality had destroyed all faith, he visited the tomb of the murdered man in the vault of San Francisco and challenged his statue to follow him to supper. The invitation was accepted; the animated statue appeared at table among the guests, and carried the blaspheming sceptic to hell. In a few later dramatic versions of the story some features are introduced belonging to another personage of the same name, Don Juan of Marana, who, having sold himself to the devil, passed the greater part of his life in debauchery and crime. His mother, however, had provided that masses should be said for his salvation, and, being converted through the influence of these, he ended his days in a monastery, where he subjected himself to the severest penance.

As a dramatic type Don Juan is essentially the impersonation of the scepticism that results from sensuality, and is thus the complement of Faust, whose scepticism is the result of speculation. In its literary treatment it has received various degrees of intensity. In the hands of the earlier Spanish dramatists it becomes, without their intending it, a solemn and impressive moral beacon, while Byron's Don Juan is a gay adventurer, with nothing in common with the legendary personage except his name and his libertinism. The first introduction of the story into dramatic literature seems to have been in Lope de Vega's *Money makes the Man*, where the incident of a walking statue occurs; but the earliest occasion on which the story was dramatized as a whole was in the *Burlador de Sevilla* (The Deceiver of Seville) of Gabriel Tellez, who published his secular works under the name Tirso de Molina. The Don Juan of this play is almost heroic in his fearlessness, indulging his cold grim humour without restraint even in the realized presence of the supernatural; but his unrelieved depravity revolts the moral sense. From Spain the drama was soon after 1620 transferred to Italy, where a translation of it was produced at Naples. A few years later it was transferred to Paris, where it was frequently acted, sometimes in the form of a translation of the work of Tellez, and sometimes in more or less free imitations, of which several were produced. A new aspect was given to the character in Molière's *Don Juan, ou le Festin de Pierre* (1665), where the hero, though as heartlessly depraved as in the Spanish original, loses some of the sterner elements both of his wickedness and of his humour, and becomes more seductive and more amusing. Into English literature the story was first introduced by Shadwell's *Libertine* (1676), a grossly indecent and, from a literary point of view, worthless play. The continued popularity of the legend in the country of its birth is attested by the fact that it has furnished the groundwork for a play—*Don Juan Tenorio* (1844),—and two poems—*El Desafío del Diablo*

and *Un Testigo di Bronce* (1845),—by the celebrated poet Zorrilla. During the present century it has also been a favourite subject with French writers of the romantic school, having been dealt with by Dumas the elder, Musset, Levasseur, Mallefille, and others. Its capacity for musical treatment has been tested by two composers of the first rank. Gluck made Don Juan the hero of a ballet, and Mozart's opera, *Don Giovanni*, the libretto of which was furnished by Da Ponte, has probably done more to popularize the story in the Molière as distinct from the severer early Spanish form than any other setting, literary or musical, it has ever received.

DONAGHADEE, a market town of Ireland, in county Down, situated near the mouth of Belfast Lough on the Irish channel, is the nearest port in Ireland to Great Britain, being 21½ miles S.W. of Port Patrick in Wigtownshire. It consists of two principal streets, and possesses a harbour which admits vessels of 16 feet in draught. On the north-east side of the town there is a *rath* 70 feet high, in which a powder magazine has been built. The town is frequented for sea-bathing in the summer months. Population (1871), 2226.

DONALDSON, JOHN WILLIAM, a philologist and biblical critic, born 1812, died February 10, 1861. He was educated at the London university and at Trinity College, Cambridge, of which college he was afterwards elected a fellow. He graduated in the year 1834, being placed in the second class of the mathematical tripos, and second in the classical tripos, when G. J. Kennedy was senior, and W. Forsyth, the author of *Hortensius*, third classic. After his degree he devoted himself with unremitting energy to classical philology, and the *New Cratylus*, which appeared five years later, is not only a work of wonderful erudition for so young a man, but forms a landmark in the history of philology in England. In 1841 he was elected to the head-mastership of King Edward's school at Bury St Edmunds, a position which he held for over ten years. On resigning this post he returned to Cambridge, where his time was divided between literary work and private tuition. At the time of his death, which was accelerated by over-study, he was engaged in the preparation of a Greek lexicon.

The *New Cratylus*, the work on which Dr Donaldson's fame mainly rests, is an attempt to apply the general principles of comparative philology to the Greek language. The book consists of two parts—a general introduction, in which the philosophy of language and the ethnographical affinities of the ancient Greeks are discussed, and a treatise on the grammatical structure and etymology of Greek. It is mainly founded on the comparative grammar of Bopp, but a large part of it is original, and it is but just to the English philologist to observe that the great German's grammar was not completed till ten years after the first edition of the *Cratylus*. In the *Farronianus*, which followed in 1844, the same method is applied to the classification and analysis of Latin and the other Italian dialects. It includes a critical commentary on the remains of old Latin, Umbrian, and Oscan. If we consider the recent birth and rapid strides of philology it is not wonderful that these early essays should have been superseded by the riper labours of such men as Curtius, Schleicher, and Mommsen. Distinguished as Donaldson's works are by wide and varied learning, much ingenuity, and independence of thought, they are deficient in soberness of judgment, and, most of all, in the ability to distinguish between certain inference and uncertain conjecture. More especially are these defects apparent in the ethnographical theories of the *Farronianus*. To take a single instance, the origin and affinities of the Etruscan language, problems which have yet to be solved are stated no less confidently than those of modern French.

Before discussing his other works it is necessary to mention an unfortunate controversy which this book provoked. A charge of plagiarism was brought against the author by the late Professor Key, and a war of pamphlets followed as violent as those which were common in the days of Bentley and Porson. Without attempting to decide on the merits of this dispute, it is enough to state that though the obligations of Donaldson to Key ought in the first instance to have been more explicitly acknowledged, yet the strictures of the latter were needlessly sweeping and aggressive.

We pass on to Donaldson's work as a biblical critic. In 1854 he published his *Jashar, or Fragments of original Hebrew songs inserted in the Masoretic text of the Old Testament*. The book was written in Latin, as an appeal *ad clerum*, to the learned world in general, and especially to German theologians. It is an attempt to reconstitute the lost book of Jashar from the remains of old songs and historical records, which, according to the author, are incorporated in the existing text of the Old Testament. Here, too, we notice the same merits and defects as in the *Cratylus*, the same ingenuity and learning, the same rash and over-confident speculation. The bold views of the author on the nature of inspiration, and the free handling of the sacred text, provoked a storm of theological odium, but the only one of his numerous assailants who deserves mention is Dr Perowne. A full analysis of the book will be found in Smith's *Biblical Dictionary*, s. v. "Jashar."

Of his numerous other works the most important are *The Theatre of the Greeks*, *The History of the Literature of Ancient Greece* (a completion of K. O. Muller's work), an edition of *Pindar*, and a Hebrew, a Greek, and a Latin Grammar. Among his occasional writings the article "Philology" in the 8th edition of this *Encyclopædia* is the most important. Though much of what he wrote has already become obsolete, Donaldson will long be remembered as one of the pioneers of philology in England.

DONATELLO (1386–1466), the diminutive of Donato, was the son of Niccolò Bardi, and was born in Florence in 1386. In the struggle between the rival parties of the Albizzi and the Medici, the father took part with the former, and was involved in their ruin. He must have been a man of considerable property, judging from the decree by which his houses are confiscated. His son Donatello found protection and shelter and the means of early training from the Martelli family, and to this connection must be ascribed Donatello's introduction to the great Cosmo de' Medici, *pater patriæ*, who during the life-long relation between himself and the artist, did everything to efface, by kindness towards the son, the recollection of the sufferings which the house of Medici had inflicted on the father. He learned the goldsmith's trade under the father of the renowned Lorenzo Ghiberti, and the goldsmith's trade then included all kinds of bronze creations. At the age of seventeen he set out for Rome with his friend Brunellesco. At Rome the two young men maintained themselves by working as goldsmiths during the first half of the week, devoting the second half to the study of the ancient monuments, and to making excavations in search of lost works of art. The Romans, we are told, believed them to be treasure-seekers. The Romans of Donatello's time still reflected the feelings with which their forefathers, nearly three centuries before, had wondered when the agents of Henry of Blois, bishop of Winchester, dug up and carried away from their city similar artistic treasures. On their return to Florence, rich in artistic knowledge and treasures, the careers commenced in which Brunellesco was destined to hang above the Florence cathedral the dome of the Pantheon, and Donatello to impart to the multitudinous

creations of his chisel the truthfulness and grace and power for which he was so largely indebted to his ancient models. There exist 40 works of Donatello of unquestioned authenticity, and 31 respecting which controversies have arisen, and 25, recorded by his contemporaries but no longer found, must be added to the number. When it is borne in mind that many of these works are life-size or colossal statues, or large bas-reliefs crowded with figures, an idea may be formed of the extent of his labours, prosecuted untiringly during a life which extended to eighty years. He was fortunate in the precise period of his labours. During the whole of the previous century Florentine art had concentrated its efforts on the creation of its grand architectural monuments. In the second half of the 15th century sculpture was cultivated, but chiefly to adorn the palaces and gratify the vanity of the rich. Donatello, placed between the two periods, could devote his genius to the execution of the great plastic works required for the completion and adornment of the public buildings of the state. Hence the statues of the church of St Michele, those on Giotto's belfry, the pulpit of St Lorenzo, those in the baptistry, as well as all the other works which still remain exactly where first placed—unhappily no longer the case with the St George—possess an exceptional beauty, for no sculptor ever studied more carefully than Donatello the exact relation of a work to its local destination. The varied and characteristic elements of Donatello's art, what he borrowed from the antique, what peculiar tricks of drapery he took from his immediate predecessors, how, from his first habit of painting his figures he passed into a phase of purely sculptured effects, how he was influenced by his friend Brunellesco in his treatment of proportion and perspective, how he imparted a more pictorial character by the greater flatness of the figures to his bas-reliefs, all this forms one of the most interesting chapters in the history of Renaissance sculpture. Besides Florence he worked also at Rome, Padua, Venice, Siena, Modena, Mantua, and Ferrara; and he visited Rome a second time. In Padua he produced, in 1432, the equestrian statue of Gattamelata with some minor works, and as almost his latest work we may consider the statue of St Louis of France, executed for St Croce. To English students of art it may be satisfactory to learn that, in the opinion of Semper, the South Kensington museum possesses seven undoubted specimens of Donatello, besides one, the Magdalen seated on clouds, probably by a scholar, and a virgin and child of doubtful origin. Donatello, though best known as a sculptor, was likewise a painter,—at least was admitted as such into the academy of St Lucca in 1412. We find him paid for architectural drawings and opinions respecting the dome of the Florence cathedral in 1420, and he was sent as military engineer to the siege of Lucca in 1430. His first trade of goldsmith was never abandoned. Thus varied and versatile, we cannot but form the highest opinion of one respecting whom Vasari has said that he threw the same love of art into every work great or small, and that he always did more than he promised. His life-long attachment to his patron Cosmo was only equalled by his lavish kindness to his friends; for we read that the large sums received by him were kept in an open box in his workshop, and that his friends when wanting money were invited and expected to help themselves, no questions being asked or receipts given. In his last years he was provided for by Piero, the son of Cosmo. He died at Florence in 1466. Donatello's greatest works, his Baptist, David, Judith, St George, and Mark, are declared by some recent critics not to rise into the highest sphere of true Christian art. The sculptor, we are told, wanted the deep faith of Michelangelo. Perhaps the best corrective of this criticism is the language of Michelangelo himself, who, when gazing with generous admiration

on the St Mark, exclaimed, "So noble a figure could indeed write a gospel."

DONATI, GIOVANNI BATTISTA, professor of astronomy at the Royal Institution of Florence, was born at Pisa, December 16, 1826, and died at Florence, September 20, 1873. In 1852 he became an assistant at the Florentine observatory, of which in 1864 he was appointed director. On June 2, 1858, he discovered the comet which bears his name (see vol. ii. p. 815). Other comets were discovered by him on June 3, 1855, November 10, 1857, and July 23 and September 9, 1864. He made numerous spectroscopic observations of comets and the solar disc, and in 1862 published diagrams of three or four lines in the spectra of fifteen stars. The new observatory on the hill of Arcetri, near Florence, was erected under his superintendence, and was directed by him. At the time of his death Donati had just returned from Vienna, where he was the representative of Italy in the international meteorological congress.

DONATISTS, a powerful sect which formed itself in the Christian church of northern Africa in the beginning of the 4th century.¹ In its doctrine it sprang from the same roots, and in its history it had in many things the same character, as the earlier Novatians. The predisposing causes of the Donatist schism were the belief, early introduced into the African church, that the validity of all sacerdotal acts depended upon the personal character of the agent and the question, arising out of that belief, as to the eligibility for sacerdotal office of the *traditores*, or those who had delivered up their copies of the Scriptures under the compulsion of the Diocletian persecution; the exciting cause was the election of a successor to Mensurius, bishop of Carthage, who died in 311. Mensurius had held moderate views as to the *questio iurata* of the treatment of the *traditores* and accordingly a strong fanatical party had formed itself in Carthage in opposition to him, headed by a wealthy and therefore influential widow named Lucilla, and countenanced by Secundus of Tigisis, primate of Numidia. There were thus two parties each anxious to secure the succession to the vacant see. The friends of the late bishop fixed their choice on Cæcilian, the archdeacon, and secured his election and his consecration by Felix, the bishop of Aptunzia, before the other party were ready for action. It had been customary, though probably it was not essential, that the Numidian bishops should be present at the election and consecration of the bishop of Carthage; Cæcilian's party had not waited for them, knowing them to be in sympathy with their opponents. Soon after Cæcilian's consecration, however, Secundus and seventy of the Numidian bishops arrived at Carthage, and steps were at once taken to displace the new bishop. A synod was formed before which Cæcilian was summoned; his consecration was declared invalid, on the ground that Felix had been a traditor; and finally, having refused to obey the summons to appear, he was excommunicated, and Majorinus, a dependent of Lucilla's, consecrated in his stead. Thus the schism became overt, and in a very short time there were rival bishops and rival churches in most of the cities of North Africa, as well as in Carthage.

The inevitable appeal to the civil power to settle the dispute was first made by the Donatists, who were incited to do so by receiving proof, in their exclusion from certain privileges conferred on the African church, that the sympathies of Constantine were with the other party.

¹ There were two Donatuses connected with the Donatist sect, Donatus of Casæ Nigræ, and Donatus surnamed Magnus, who succeeded Majorinus as the Donatist bishop of Carthage. The name of the sect was probably derived from the latter, who was the more influential of the two. It is to be observed that the Donatists themselves repudiated that designation, which was applied to them by their opponents as a reproach. They called themselves "Pars Majorinæ" or "Pars Donati."

They accordingly petitioned the emperor to appoint a commission to try the case, indicating a preference for Gallic bishops, among whom there were no traditors, the Diocletian persecution not having extended to Gaul. The result was that a commission was issued to five Gallic bishops, under the presidency of Miltiades, bishop of Rome. The number of referees was afterwards increased to twenty, and the case was tried at Rome in 313. Ten bishops appeared on each side, the leading representative of the Donatists being Donatus of Casæ Nigræ. The decision was entirely in favour of Cæcilian, and Donatus was found guilty of various ecclesiastical offences. An appeal was taken and allowed; but the decision of the synod of Arles (314) not only confirmed the position of Cæcilian, but greatly strengthened it by passing a canon that ordination was not invalid because performed by a traditor, if otherwise regular. Felix had previously been declared innocent after an examination of records and witnesses at Carthage. A further appeal to the emperor in person was heard at Milan in 316, when all points were finally decided in favour of Cæcilian. As a necessary consequence of this the power of the state was directed to the suppression of the defeated party. Persistent Donatists were no longer merely heretics; they were rebels, and incurred the confiscation of their church property and the forfeiture of their civil rights.

The attempt to destroy by force a fanatical sect had its usual result in only intensifying its fanaticism and consolidating its sectarianism. Majorinus, the Donatist bishop of Carthage, dying in 315, was succeeded by Donatus, surnamed Magnus, a man of great force of character, under whose influence the schism gained fresh strength from the opposition it encountered. Force was met with force, the Circumcelliones, bands of fugitive slaves and vagrant (*circumcellas*) peasants, were enlisted as the champions of Donatism, and their violence reached such a height as to threaten civil war. In 321 Constantine, seeing probably that he had been wrong in abandoning his usual policy of toleration in this case, sought to retrace his steps by granting the Donatists liberty to act according to their consciences, and declaring that the points in dispute between them and the orthodox should be left to the judgment of God. This wise policy, to which he consistently adhered to the close of his reign, was not followed by his son and successor in the Western Empire, Constans, who, after repeated attempts to win over the sect by bribes, resorted to persecution. The renewed excesses of the Circumcelliones, among whom were ranged fugitive slaves, debtors, and political malcontents of all kinds, had given to the Donatist schism a socialist aspect; and its forcible suppression may therefore have seemed to Constans even more necessary for the preservation of the empire than for the vindication of orthodoxy. The power which they had been the first to invoke having thus declared so emphatically and persistently against them, the Donatists were led to adopt the theory known in more recent times as that of spiritual independence, which Donatus Magnus formulated in the question, "What has the emperor to do with the church?" (*Quid est imperatori cum ecclesia?*) Such a theory naturally aggravated the lawlessness of the Circumcellion adherents of the sect, and their outrages were in turn made the justification for the most rigorous measures against the whole Donatist party indiscriminately. Many of their bishops fell victims to the persecution, and Donatus and several others were banished from their sees.

With the accession of Julian (361) an entire change took place in the treatment of the Donatists. Their churches were restored and their bishops reinstated, with the natural result of greatly increasing both the numbers and the fanaticism of the sect. A return to the earlier policy of repression was made under Valentinian I. and

Gratian, by whom the Donatist churches were again closed, and all assemblies of adherents of the sect forbidden. It was not, however, until the commencement of the 5th century that the sect began to decline, owing partly to the occurrence of a division within it, but still more to the arguments used against it by the greatest theologian of the early church. The division arose out of a quarrel between Maximian, a deacon in Carthage, and Primian, the successor of Parmenian in the (Donatist) bishopric. Maximian, being excommunicated, formed a party which, as Neander puts it, "stood in precisely the same relation to the body of the Donatists as the Donatists themselves did to the Catholic church." The dispute was a source of weakness in itself, and still more by the unanswerable arguments it furnished to the Catholic party, who during the reign of the emperor Honorius made repeated and determined efforts to secure the extinction of the schism. In 405 an imperial edict was issued commanding the Donatists, under the severest penalties, to return to the Catholic church. Meanwhile the more appropriate weapon of argument was being effectively wielded by the Catholic party, under the leadership of one of the ablest controversialists the Christian church has ever known. Augustine, bishop of Hippo, after several years' negotiation, found it possible to arrange a great conference between the Donatists and the orthodox, which took place under the orders of the emperor at Carthage in 411. There were present two hundred and eighty-six Catholic and two hundred and seventy-nine Donatist bishops. Before entering on the proceedings the Catholics pledged themselves, if defeated, to give up their sees, while in the other event they promised to recognize the Donatists as bishops on their simply declaring their adherence to the Catholic church. The latter proposal, though it was received with scorn at the time, had perhaps ultimately as much influence as the resistless logic of Augustine in breaking the strength of the schism. The discussion, which lasted for three days, Augustine and Aurelius being the chief speakers on the one side, and Primian and Petilian on the other, turned exclusively upon the two questions that had given rise to the schism,—first, the question of fact, whether Felix had been a traitor, and secondly, the question of doctrine, whether a church by tolerance of unworthy members within its pale lost the essential attributes of purity and catholicity. On the second point, to which alone abiding interest attaches itself, the Catholic view was stated and defended by Augustine with a force of argument, an aptness of quotation from Scripture (often, however, founded on misinterpretation), and a beauty of language that all but compel assent. Nowhere else in polemical theology are there to be found more valuable statements as to the connection between the divine and the human elements in the communication of grace, and as to the relative importance of the two attributes of catholicity and purity respectively as tests of the true church. It is to be observed, however, that on the side of Augustine as well as on that of his opponents there is the inevitable confusion of thought that arises from failure to apprehend the distinction between the visible and the invisible church.

The decision of Marcellinus, the imperial commissioner, was in favour of the Catholic party on both questions, and it was at once confirmed on an appeal to the emperor. As in the case of the similar decision almost exactly a century earlier, there followed the severest penal measures against the schismatics, the clergy being banished and the laity subjected to heavy fines. The extinction of the schism, which all the arguments of Augustine had failed to effect, was still less to be brought about by persecution. The Donatists continued to maintain an independent existence until the 7th century, when they disappear from history,

along with the whole Christian church of North Africa, before the invading Saracens.

"Donatisten," Robertson's *History of the Christian Church*.

DONATUS, ÆLIUS, a grammarian and rhetorician, who taught at Rome in the middle of the 4th century A.D., had the honour of numbering St Jerome among his pupils, and was the author of a number of professional works. We still possess his *Ars grammatica*, consisting of three parts, *De literis, syllabis, pedibus et tonis*, *De octo partibus orationis*, and *De barbarismo, solecismo, schematibus, et tropis*; the larger portion of his commentary on Terence, in a greatly interpolated condition; and a few fragments of his notes on Virgil preserved and severely criticised by Servius. The first of these works, and especially the section *De octo partibus*, though possessing little claim to originality, and in fact evidently based on the same authorities which were used by Charisius and Diomedes, attained such popularity as a school-book that in the Middle Ages the writer's name became a common metonymy for a rudimentary treatise of any sort, and bade fair to furnish as permanent an addition to the English vocabulary as has been obtained in French from the name of Calepinus. *Avarecia*, for example, in the *Vision of Piers Plowman*, tells how he "drowe among draperes his donet to learn;" and bishop Peacock published about 1440 a *Donat into Christian Religion*. On the introduction of printing the little book was one of the first rendered accessible by the new process, and editions were soon multiplied to such an extent that the bibliography of Donatus is nearly as intricate a subject as that of the Bible. Copies still exist, though in a mutilated condition, of impressions produced by the early wooden-block system, details about which may be found in Soetmann's "*Älteste Geschichte der Xylographie*" in the *Historische Taschenbuch* for 1837. The *Ars Grammatica* is reprinted by Putsch in *Gram. Latine Auctores Antiqui*, Hanover, 1605, and by Lindemann in *Corpus Grammaticorum Latinorum*, vol. i.; and the *Commentaries on Terence*, first published at Rome in 1472, may be found in Klotz's edition of the dramatist, 1838-40. The *Commentary on Virgil* discovered by J. Jovian Pontanus, and published by Scipio Capelinus at Naples in 1535, is the work of a later grammarian of the same name, Tiberius Claudius Donatus.

See Truffet, *History of Roman Literature*, vol. ii., and the writers there referred to.

DONAÜWÖRTH, a town of Bavaria, in the circle of Swabia-Neuburg, 25 miles N. of Augsburg, on the left bank of the Danube, at the confluence of the Wörnitz. It is of some importance as a river port, and the centre of a considerable agricultural trade; but its main interest is historical. Having grown up in the course of the 11th and 12th centuries under the protection of the castle of Mangoldstein, it became in the 13th the seat of the duke of Upper Bavaria, who, however, soon withdrew to Munich to escape if possible from the manes of his wife Maria of Brabant, whom he had there beheaded on an unfounded suspicion of infidelity. The town received the freedom of the empire in 1308, and maintained its position in spite of the encroachments of Bavaria till 1607, when the interference of the Protestant inhabitants with the abbot of the Holy Cross called forth an imperial law authorizing the duke of Bavaria to inflict chastisement for the offence. In the Thirty Years' War which soon after broke out, it was stormed by Gustavus Adolphus in 1632, and captured by King Ferdinand in 1634. In the vicinity the Bavarians and French were defeated by Marlborough and Prince

Louis of Baden in 1704. The imperial freedom restored to the town by Joseph I. in 1705 was again lost by re-incorporation with Bavaria in 1714. The abbey of the Holy Cross is still standing, and the neighbouring chapel still preserves the sarcophagus of the unfortunate duchess Maria.

DONCASTER, the *Danum* of Antoninns and *Dona Caster* of the Saxons, a municipal borough and market-town of England, in the west riding of Yorkshire, 32 miles S of York and 156 miles N. of London by railway, in the line of the ancient Roman road of Ermine street or, as some write, Watling street, is situated on the right bank of the Don, over which and an arm of it called the Cheswold it has two bridges. The parish church of St George, occupying the site of an older structure of the same name destroyed by fire in 1853, was finished in 1858 at a cost of £43,128; its tower is 172 feet high. Among the other public buildings are Christ Church and St James's, the mansionhouse, market-hall, guildhall, theatre, grammar school, infirmary, and jail. The commerce of Doncaster is mainly agricultural, and the corn market is of considerable importance. The manufactures are iron and brass ware, sacking and linen, spun flax, ropes, and agricultural machines. About a mile to the south-east of the town is the race course, which is nearly circular, and has a circumference of 1 mile 7 furlongs and 70 yards; the principal races held annually commence on the Tuesday after the 10th of September. The grand stand, erected in 1777, has been frequently altered and improved, but has lost much of its importance by the erection of minor stands. Races have long been held at Doncaster, and there was a stand on the course before the year 1615. The St Leger race takes its name from Lieut.-Gen. St Leger, who originated it in 1776; but it was not so named till 1778. Doncaster received its first charter from Richard I. In 1399, after landing at Ravenspur, Bolingbroke, subsequently Henry IV., lodged for a time in the town. In 1871 the population of the municipal borough was 18,768. The area is 1691 acres.

Arms of Doncaster.

DONEGAL, a maritime county in the extreme north-west of Ireland, in the province of Ulster, bounded on the N. and W. by the Atlantic Ocean, on the E. by Lough Foyle, and the counties of Londonderry and Tyrone, and on the S. by Donegal Bay and the counties of Fermanagh and Leitrim. It covers an area of 1870½ square miles, or 1,197,154 acres, of which 22,880 are under water.

Coast.—The county possesses a large extent of sea-coast indented by numerous inlets. Ballyshannon harbour, the most southern of them, is small, and has a bar at its mouth, as have Donegal and Inver harbours farther west. Killybegs harbour is well sheltered, and capable of receiving large vessels. On the western coast are Bruckles or M'Swiney's Bay, and Teelin harbour, suitable for small vessels; and on the north is Sheephaven, within which is Dunfanaghy Bay, where the largest ships may lie in safety, as they may also in Mulroy Bay and Lough Swilly farther east. Lough Foyle, which divides Donegal from Londonderry, is a noble sheet of water, but is shallow and dry at ebb tide, contracted at its entrance, and encumbered with shoals. A few miles from Malin Head, the most northerly portion of the mainland of Ireland, the varied and extensive Lough Swilly runs far into the interior. From these two loughs much land has been reclaimed. Numerous islands and rocks

stud the coast. The largest island is North Aran, about fifteen miles in circumference, with a lofty hill in its centre, and a gradual declivity down to the sea. On the northern coast are Tory Island, on which is one of those singular round towers marking the holy places of ancient times, and, further east, Innistrahul the *ultima Thule* of Ireland. The inhabitants of the islands obtain a precarious livelihood by fishing, kelp-burning, and rude husbandry, but are often reduced to extreme destitution.

Mountains.—Mountains and irregular groups of highlands occupy the whole interior of the county, and a considerable portion is bog and moor land. Arrigal mountain attains an elevation of 2462 feet above the level of the sea, and commands from its summit a fine view over a considerable portion of the country. Blinestack (2213 feet) Muckish mountain (2190 feet) in Kilmacrenan barony, and Shieve Snaght (2019) in Innishowen are, next to Arrigal, the highest mountains. The eastern and southern portions of the county are comparatively level, and contain the most fertile land. Occasionally the scenery attains a character of savage and romantic grandeur in the highland districts and on the sea-coast, and of much beauty in the eastern part of the county; but a considerable portion of the surface is occupied by bogs, and entirely destitute of timber.

Geology.—The main body of the county rests upon mica slate, which forms the eastern districts and most of the barony of Bannagh. From Sheephaven to Lochrumore and the north-western coast, granite forms the surface rock, and quartz is very abundant, often forming mountains of considerable elevation. Carboniferous or mountain limestone occurs round Donegal Bay. The geological aspect of the county affords many indications of internal wealth, but very few attempts have been made to ascertain the mineral resources of the district. The minerals hitherto discovered are lead and iron. Steatite is worked to some extent at Gartan. Manganese, copper pyrites, and clay for potteries and brick-making are also found. Siliceous sand, raised in Muckish Mountain, was formerly conveyed in large quantities to Belfast and Scotland for the manufacture of glass. Indications of coal have been observed near Lough Swilly, and at Inver on the southern coast; and marble of fine quality exists in many places. Among the mountain streams the pearl-mussel (*Unio margaritifera*) is sometimes found. There are several mineral springs, the chief of which is the sulphureo-chalybeate water at Killymard near the town of Donegal.

Rivers.—With the exception of the tidal river Foyle, which forms the boundary between this county and Tyrone and Londonderry, the rivers, though numerous, are of inferior size. The branches of the Foyle which rise in Donegal are the Derg, issuing from Lough Derg, and the Finn, rising in the beautiful little lake of the same name in the highlands, and passing through some of the best cultivated land in the county. The Foyle, augmented by their contributions, and by those of several other branches from Tyrone and Londonderry, proceeds northwards, discharging its waters into the southern extremity of Lough Foyle, at the city of Londonderry. It is navigable for vessels of large burden to this place, and thence by lighters of fifty tons as far as Lifford. Boats of fourteen tons can proceed up the Finn river as far as Castlefinn. The fine river Erne flows from Lough Erne through the southern extremity of the county into the southern extremity of Donegal Bay. Its navigation is prevented by a fall of 12 feet, generally called the Salmon Leap, in the neighbourhood of Ballyshannon, and by rapids between Ballyshannon and Belleek, on the confines of Fermanagh. The Guibarra, the Aven Ea, and the Fask are the only other streams of any note.

Lakes, or rather tarns, are very numerous in Donegal.

The most remarkable, and also the largest, is Lough Derg, comprising within its waters several small islets, on one of which, Station Island, is the cave named Saint Patrick's Purgatory, a celebrated place of resort for pilgrims and devotees. The circumference of the lake is about nine miles, and the extent of the island to which the pilgrims are ferried over is less than one acre. The landscape around Lough Derg is desolate and sombre in the extreme, barren moors and heathy hills surrounding it on all sides.

Agriculture—The modes of agriculture present little that is peculiar to the county, and the spade still supplies the place of the plough where the rocky nature of the surface prevents the application of the latter implement. The soil of the greater portion of the county, *i.e.*, the granite, quartz, and mica slate districts, is thin and cold, while that on the Carboniferous limestone is warm and friable. Owing to the boggy nature of the soil, agriculture has not made much progress, although in certain districts (Gweedore, for instance) much land has been brought under cultivation, through the enterprise of the proprietors. In 1871 about 43½ per cent. of the land was returned as bog and waste, about 35 per cent. under pasture, and 21 per cent. under tillage. As an indication of the stationary condition of the husbandry of Donegal, it may be stated that the number of acres returned as under crops in 1853 was 236,097, while in 1876 it was 236,015.

The following statistics will show the details of the agricultural acreage and the numbers of live stock in recent years—

	Oats	Flax	Potatoes.	Turnips.	Meadow and clover	Total under crops.
1873	96,347	14,406	48,304	17,141	47,917	232,794
1876	95,422	15,337	47,164	17,685	51,647	236,015
	Cattle.	Sheep	Horses and mules	Pigs	Poultry	
1873	184,233	182,608	23,759	20,960	508,766	
1876	187,547	171,304	23,148	35,628	637,441	

Wheat and barley are quite an inconsiderable crop, and in this as well as in other respects Donegal is much behind the rest of Ulster in the extent of its crops. It bears, however, a more favourable comparison as regards its live stock, possessing, as it does, the largest number of cattle and sheep of any county in the province, and after Cavan the largest number of poultry.

As regards the division of the land, according to the Return of 1876, the county was held in 1874 by 2174 separate owners, whose estates amounted in the aggregate to 1,172,526 acres, valued at £340,632. There were 1171 proprietors of less than 1 acre of ground, forming a proportion of 54 per cent. of the total proprietors,—that of all Ulster being 48 per cent. The average size of the properties was 539 acres, and the value per acre, 5s. 9d., while the averages for Ulster were respectively 239½ acres and 15s. 8½d. Sixteen proprietors owned more than 15,000 acres each, and together an aggregate equal to about 45 per cent. of the whole land. They were the following:—Marquis of Conyngham, 122,300 acres; Earl of Leitrim, 54,352, H. G. Murray Stewart, 50,818, W. H. M. Style (Glenmore), 39,564, A. J. R. Stewart (Castlemore), 39,306, John Leslie, 28,827, George Harvey, 25,593; Lord G. A. Hill, 24,189, Messrs Musgrave, 23,673; Sir Samuel H. Hayes, Bart., 22,825, Thomas Connolly, 22,736, *Church Temporalities Commission*, 21,489; Wybrants Olphert (Ballyconnel), 18,133, J. G. Adair (Glenveagh), 16,308; Duke of Abercorn, 15,942; T. Y. Brooke (Lough Esk), 15,134.

Manufactures.—In Donegal, as in other counties of Ulster, the linen manufacture affords employment to a number of the inhabitants, especially at Raphoe, while the manufacture of woollen stockings and worked muslin is carried on pretty extensively. The trade in these manufactures and in the domestic produce of the county finds its

principal outlets through the port of Derry and the inland town of Strabane, county Tyrone.

Fisheries—The deep sea fisheries are important. They comprise the three districts of Killybegs, Dunfanaghy, and Carradonagh—the last-named including a small part of the Derry coast—and extend to 395 miles of maritime boundary. In 1875 there were 777 boats registered in the fisheries, manned by 3053 men and boys. The salmon fishery is also prosecuted to a considerable extent, the principal seats of the trade being at Ballyshannon and Letterkenny.

Administration, &c—The county is divided into the six baronies of Inishowen, Kilmacrenan, Boyleagh, Raphoe, Bannagh, and Tyrhagh, and into 51 parishes. It contains seven poor law unions, and ecclesiastically it belongs for the most part to the diocese of Raphoe. It is included in the military district of Belfast, and the assizes are held at Lifford on the borders of Tyrone. The population has decreased within the last 20 years at a greater ratio than the rest of Ulster, and emigration has drawn off a greater proportion of the people than in other parts of the province. For the 24 years ending in 1875 the rate of emigration has averaged 2908 per annum. By the census of 1851 Donegal contained 255,158 persons, in 1861, 237,390, and in 1871, 218,334, of whom 106,080 were males and 112,254 females—thus showing a decrease within these 20 years of 14½ per cent. In 1875 the population was estimated at 208,607.

After Cavan, Donegal is the most Catholic county in Ulster. In 1871, 75 per cent. of the inhabitants belonged to that persuasion, while 12½ per cent. were Episcopalians and 10½ per cent. Presbyterians. Education in the same year was conducted in 7 superior and 407 primary schools. There were, however, 93,285 persons above five years of age who were returned as illiterate, and 18,629 who could speak Erse only. The Donegal dialect is said to be the purest of the Irish language.

This county returned no fewer than twelve members to the Irish parliament,—two for the county at large, and two for each of the insignificant boroughs of Ballyshannon, Donegal, Killybegs, Lifford, and Johnstown. Since the union with Great Britain, it has been represented in the imperial parliament by two county members only.

Towns—The towns are small in extent and importance. Lifford, the county town (population 660), and formerly a parliamentary borough, is practically a suburb of Strabane, in the neighbouring county of Tyrone. Ballyshannon (population 2958) is the most populous and important town in the county. It stands on both sides of the river Erne, but does not derive much advantage from its favourable situation in consequence of the fall of the river, usually called the Salmon Leap, above the town, and the bar at the mouth of the harbour. Letterkenny at the head of Lough Swilly, with 2116 inhabitants, is, next to Ballyshannon, the largest town in the county. Donegal (population 1422), is situated at the foot of a range of hills in the midst of scenery of great natural beauty, with a mineral spa in the neighbourhood, and sea-bathing close to the town.

History—The greater part of Donegal was anciently called Tir-conaill, or the country of Conaill, and it was sometimes called O'Donnell's country, after the head chieftains of the district. The other chieftains of note were the O'Doghertys, MacSweeneys, O'Boyles, O'Gallaghers, O'Gormleys, O'Breshins, &c. Tyrconnell is connected with some of the earliest events recorded in Irish history or tradition. The chief castle of the O'Donnells, who became princes of Tyrconnell in the 12th century, was at Donegal, and the place of their inauguration the rock of Doune in Kilmacrenan. The celebrated Red Hugh O'Donnell, one of the most distinguished chieftains of the race, in conjunction with the Earl of Tyrone, became a formidable opponent to the Government of Queen Elizabeth, but being ultimately defeated, he sailed to Spain to solicit fresh succours, was there seized with fever, and died at Valladolid. Rory O'Donnell, who was promoted to the chieftainship by the English Government, and created Earl of Tyrconnell, a title

now extinct, became afterwards disaffected to the Government and fled to Rome, where he died in exile, his estates having been previously confiscated by James I. In 1608, Sir Cahur O'Dogherty, lord of Innishowen, deceived by hopes of aid from Spain, raised an insurrection against the English Government in Ulster. He burnt Londonderry and maintained his ground for a short period; but the Lord-Deputy Chichester having offered a reward for his head, he retired to the wilds of Kilmacrenan, and was shot by a Scotch settler in his encampment on the rock of Doune. His extensive estates were confiscated and transferred to Chichester, the ancestor of the earls and marquises of Donegall. Shortly afterwards, the colonization of Ulster with English and Scotch undertakers and settlers, in pursuance of the scheme of James I., was partially carried out, and the baronies of Boyleagh and Bannagh were allotted to John Murray; Sir James Cunningham, Sir John Stewart, and others, received the district of Portlough; the London Grocers' Company obtained Muff in Innishowen, Sir Roger Bingley, Sir John Kingsmill, and other English settlers the district round Lifford; Sir William Stewart, Sir John Kingsmill, Sir George Macbriar, Captain Hart, Sir M. M'Swine, Turlogh Roe O'Boyle, MacSwine Bannagh, MacSwine Fannet, and other servants and natives the district of Kilmacrenan. Since the period of the settlement of Ulster, no forfeitures have taken place in this county. The landholders remained loyal in the rebellion of 1641, and also during the war of the Revolution.

This district was formed into the county of Donegal in the reign of Queen Elizabeth, in 1585, by the Lord-Deputy Sir John Perrott.

Antiquities—The most noteworthy architectural remains of antiquity in the county are to be found at the head of Lough Swilly, where, situated on the summit of a hill 802 feet high, some remarkable remains exist of a fortress or palace of the Northern Irish kings. These are known as the Grianan of Aileach, and evidently date from a period prior to the 12th century. On Tory island there is one of the best specimens of a round tower and some other interesting remains.

Numerous ruins of ancient castles along the coast prove that much attention was formerly paid to the defence of the country from invasion. The principal are—Kilbarron Castle, an ancient stronghold of the O'Clerys, near Ballyshannon; Donegal Castle, built by the O'Donnells, anciently their chief residence, and now a fine ruin standing close to the water's edge; Burt Castle, built in the reign of Henry VIII. on the shores of Lough Swilly by Sir Cahur O'Dogherty, to whom is also attributed the erection of Green Castle, one of the strongholds of the clan on Lough Foyle.

Near the Castle of Doe, or M'Swiney's Castle, at Horn Head, is a natural perforation in the roof of a cave, called M'Swiney's Gun, formed by the workings of the ocean into the overhanging cliff. When the wind blows due north, and the tide is at half flood, the gun is seen to spout up jets of water to a height of 100 feet, attended with explosions heard occasionally in favourable weather at an immense distance. Gulmore Fort, on the coast of Lough Swilly, supposed to have been erected by the O'Doghertys, having come into the possession of the crown, was granted in 1609 to the corporation of London. It was afterwards enlarged or rebuilt, and acted a prominent part in the celebrated siege of Derry.

Traces of religious houses, some existing only in traditional or documentary records, are also numerous. Ashroe Abbey, on a small stream near Ballyshannon, was of great extent. The ruins of that of Donegal, founded in 1474, also afford proofs of its ancient grandeur. It was there that the celebrated collection of ancient Irish annals were written, known by the name of the Annals of the Four Masters, and sometimes called the Annals of Donegal, compiled in the year 1632, by Michael O'Clery and his coadjutors.

DONGOLA, or **DONKOLA**, a town of Egypt, in the district of the same name in the province of Nubia, situated on the left bank of the Nile, about 45 miles above the Third Cataract. It is frequently styled Dongola Makarah, or New Dongola, to distinguish it from Dongola Agusa, or Old Dongola, a now decadent village 75 miles further up the river, which was formerly a flourishing fortified town, but fell into ruins after the devastation of the Mamelukes. Kasr Dongola, or Castle Dongola, and El Ordeh, or The Barracks, are also names in use. The town grew up round the military and administrative buildings established about 1820 by the Egyptian Government; and it is now a thriving commercial centre, with well-furnished bazaars, an indigo factory, and public baths. The barracks were built after a plan by the celebrated German naturalist Ehrenberg. Population about 6000.

DONIZETTI, **GAETANO** (1798–1848). There is a strange parallelism observable in the lives of the three most celebrated Italian composers of the present century. Rossini,

Bellini, and Donizetti had no sooner established their reputations on the Italian stage than they left their own country for Paris, at that time the centre of the musical world. All three settled in France, and all three were anxious to adapt the style of their music to the taste and artistic traditions of their adopted country. The difference which exists between Rossini's *Tell* and his *Semiramide* may, although in a less striking degree, be noticed between Donizetti's *Fille du Régiment* and one of his earlier Italian operas. But here the parallel ends. As regards artistic genius Donizetti can by no means be compared with his illustrious countrymen. He has little of Bellini's melancholy sweetness, less of Rossini's sparkle, and is all but devoid of spontaneous dramatic impulse. For these shortcomings he atones by a considerable though by no means extraordinary store of fluent melody, and by his rare skill in writing for the voice. The duet in the last act of the *Favorita* and the celebrated *ensemble* in *Lucia* following upon the signing of the contract, are masterpieces of concerted music in the Italian style. These advantages, together with considerable power of humorous delineation, as evinced in *Don Pasquale* and *L'Elisir d'Amore*, must account for the unimpaired vitality of many of his works on the stage.

The life of Donizetti may be told in few words. He was born at Bergamo in 1798, the son of a Government official of limited means. Originally destined for the bar, he showed at an early age a strong taste for art. At first, strangely enough, he mistook architecture for his vocation, and only after an unsuccessful trial in that direction did he discover his real talent. He entered the conservatoire of his native city, where he studied under Simon Mayr, the fertile operatic composer. His second master was Mattei, the headmaster of the celebrated music school of Bologna, where Donizetti resided for three years. After his return to Bergamo the young composer determined to devote himself to dramatic music, but his father insisted upon his giving lessons with a view to immediate gain. The disputes arising from this cause ultimately led to Donizetti's enlisting in the army. But this desperate step proved beneficial against all expectation. The regiment was quartered at Venice, and here the young composer's first dramatic attempt, an opera called *Eurico Conte di Borgogna*, saw the light in 1818. The success of this work, and of a second opera brought out in the following year, established Donizetti's reputation. He obtained his discharge from the army, and henceforth his operas followed each other in rapid and uninterrupted succession at the rate of three or four a year. Although he had to contend successively with two such dangerous rivals as Rossini and Bellini, he succeeded in taking firm hold of the public, and the brilliant reception accorded to his *Anna Bolena* at Milan carried his name beyond the limits of his own country. In 1835 Donizetti went for the first time to Paris, where, however, his *Marino Faliero* failed to hold its own against Bellini's *Puritani*, then recently produced at the Théâtre Italien. The disappointed composer went to Naples, where the enormous success of his *Lucia di Lammermoor* consoled him for his failure in Paris. For Naples he wrote a number of works, none of which is worth notice. In 1840 the censorship refused to pass his *Polauto*, an Italian version of Corneille's *Polyclete*, in consequence of which the disgusted composer once more left his country for Paris. Here he produced at the Opera Comique his most popular opera, *La Fille du Régiment*, but again with little success. It was not till after the work had made the round of the theatres of Germany and Italy that the Parisians reconsidered their unfavourable verdict. A serious opera, *Les Martyrs*, produced about the same time with the *Daughter of the Regiment*, was equally unsuccessful.

ful, and it was reserved to *La Favorita*, generally considered as Donizetti's masterpiece, to break the evil spell. His next important work, *Linda di Chamounix*, was written for Vienna, where it was received most favourably in 1842, and the same success accompanied the production of *Don Pasquale* after Donizetti's return to Paris in 1843. Soon after this event the first signs of a fatal disease, caused to a great extent by overwork, began to show themselves. The utter failure of *Don Sebastian*, a large opera produced soon after *Don Pasquale*, is said to have hastened the catastrophe. A paralytic stroke in 1844 deprived Donizetti of his reason, for four years he lingered on in a state of mental and physical prostration. A visit to his country was proposed as a last resource, but he reached his native place only to die there on April 1st, 1848. The sum total of his operas amounts to 64, the more important of which have been mentioned in the course of this notice. The large number of Donizetti's works at the same time accounts for many of their chief defects. His rapidity of working made all revision impossible. It is said that he once wrote the instrumentation of a whole opera within thirty hours, a time hardly sufficient, one would think, to put the notes on paper. And yet it may be doubted whether more elaboration would have essentially improved his work; for the last act of the *Favorita*, infinitely superior to the preceding ones, is also said to have been the product of a single night.

DONNE, JOHN (1573–1631), poet and divine of the reign of James I., was born in London in 1573 of Catholic parents. His father was a wealthy and influential merchant, a Welshman by descent, his mother claimed relationship with Sir Thomas More and Heywood the epigrammatist. Brought up under a tutor at home until his tenth year, he proceeded to Oxford, and was entered at Hart Hall about 1583. At the university his learning was extraordinary, and he was compared, for juvenile erudition, with Pico della Mirandola. In 1587 he was removed to Trinity College, Cambridge, but he took no degree there or at Oxford, his scruples as a Catholic standing in the way. In 1590 he went up to London and was admitted into Lincoln's Inn. His father presently died, and left his son £3000. Until he came of age, he was under his mother's care, and it is supposed that this was the period to which he refers in *Pseudo-Martyr*, in which an increasing conviction of the truth of Protestantism struggled with the old faith and the familiar surroundings. Walton has given an interesting account of Donne's change of faith, which probably took place about 1592. Before this he must have been writing, for many of the *Divine Poems*, and of these not the worst, are obviously written by a sincere Catholic. The rebound from Catholic asceticism was a severe trial to an ardent nature, it seems that he plunged into various excesses, and that his father's legacy was rapidly squandered. In 1593, however, he had already laid the foundation of his poetic reputation. The first three of his famous *Satires* exist in a MS. dated 1593, and the rest appear to have been composed at various times before 1601. In 1594 he commenced his travels, wandering over Europe, and accompanying the earl of Essex at the taking of Cadiz in 1596, and again in the expedition of 1597. It has been thought that he was engaged in military service in Holland in 1596. He did not return to England until he had seen Italy, and was planning an excursion into Palestine, when the difficulty of travelling in the East diverted his thoughts to Spain. In both Italy and Spain he took considerable pains to master the language and existing literature of each country, as the notes to his works testify. It is possible that the fantastic Spanish school of conceits, which takes its name from Gongora, may have affected the style of Donne. Returning to

England, he secured the patronage of Sir Thomas Egerton, afterwards Lord Chancellor Ellesmere, who appointed him his chief private secretary, and took so much delight in his company and conversation that he made him lodge under his roof. The young poet was five years in Egerton's house, with every prospect of a successful career. He had the misfortune, however, to fall in love with the daughter of Sir George More of Loxly, lord lieutenant of the Tower, who was visiting in the house. Donne's love was returned, but her father violently objected. Recalling her to Loxly, he was enraged to find that the young couple had already been privately married. In his anger, Sir George More not only persuaded Lord Ellesmere to dismiss his secretary, but threw Donne, with his friend Christopher Brooke, the poet, who had given the bride away, into prison. They were soon released, but the father was inexorable, and the young couple would have suffered from penury if it had not been for the generosity of Sir Francis Woolley, who invited them to reside at his house. During these later years Donne had written much in prose and verse. He had completed his *Satires*, and in 1601 he had written his extraordinary poem of *The Progress of the Soul*, which De Quincey has so warmly praised. In 1602 ten sonnets, addressed to Philomel, were printed in Davison's *Poetical Rhapsody*. It is probable that many of his miscellaneous elegies and lyrics date from the same period of early manhood. Among his early works, too, we know was the singular treatise called *Biathanatos*, in praise of suicide, of which he was afterwards ashamed, and which was not printed until long after his death, in 1648. The early follies of his career were now, however, played out, and his temperament was become so grave and earnest that it attracted the attention of Morton, afterwards bishop of Durham, who was staying in the house of Sir Francis Woolley in 1607, and who offered the poet certain preferment in the church, if he would only consent to take holy orders. Donne, however, had conscientious scruples against taking such a step. His generous patron soon after died, and the Donnes took a house at Mitcham, where they resided for two years. It was here that in 1610 he published his prose work against the Catholics, *Pseudo-Martyr*, and in 1611 a still more bitter polemical treatise, *Ignatius his Conclave*. In 1611, moreover, appeared Donne's first poetical work, *The Anatomy of the World*, of which revised and enlarged editions appeared in 1612, 1621, and 1625. This was but a pamphlet, however. He was urged by Sir Robert Drury to come with his wife and their eleven children to reside in his mansion in Drury Lane, after some demur this offer was accepted, but when, almost immediately after their arrival, Sir Robert desired Donne to travel on the Continent with him, Mrs. Donne, who was in feeble health, strongly objected. It seems almost certain that this objection caused him to compose one of his lovehest poems—

Sweetest Love, I do not go
For weariness of thee

He permitted himself to be persuaded, however, and accompanied his patron to Paris, where he is said to have had a vision of his wife, with her hair over her shoulders, bearing a dead child in her arms, on the very night that Mrs. Donne, in London, was delivered of a still-born infant. This was in 1612. In 1613 he published *An Elegy on the Death of Prince Henry*. Efforts were made to gain him preferment at court, but James I., who had conceived a high opinion of Donne's theological gifts, refused to give him a single post out of the church. The poet's scruples were at last removed, and in 1614 he preached in orders before the king at Whitehall. Within a single year fourteen good livings were offered to him, but he refused them all, simply accepting the post of lecturer at Lincoln's Inn. In 1617 the death of his wife was a blow under which his health

so far suffered that he was persuaded by his friends to go abroad, and to spend more than a year in Germany. In 1619 he returned, with the expectation of the deanery of Canterbury. This he did not gain, but in 1620 he was appointed dean of St Paul's. To the kindness of the earl of Dorset he owed the vicarage of St Dunstan in the West. In 1624 he was elected prolocutor to Convocation, and the same year was attacked by an illness that threatened to prove immediately fatal, but from which he rallied. He continued in feeble health for some years, and preached for the last time before Lent 1630, an oration which the king called "the Dean's own funeral sermon," and which was printed, under the title of *Death's Duel*, in 1632. On the 31st of March 1631, he died, having previously wrapped himself in his winding sheet to have his portrait taken. He was buried in St Paul's cathedral. Very few of Dr Donne's writings were published during his life-time. It is supposed that an edition of the *Satires* may have been printed before the close of the 16th century, but if so, it has entirely disappeared. His poems were first collected in 1633, and afterwards in 1635, 1639, 1649, 1650, 1654, and 1669, of which editions the second and last appear to be tolerably trustworthy. Of his prose works the *Juvenilia* appeared in 1633; the *LXXX. Sermons*, with an admirable life of the author by Izaak Walton, in 1640; the *Essays in Divinity* in 1650; and the *Letters to Several Persons of Honour* in 1651. No very excellent modern biography of the poet or edition of his works has been issued. Dr A. B. Grosart's privately printed edition of the poetical works is very complete.

It is singularly difficult to pronounce a judicious opinion on the writings of Donne. They were excessively admired by his own and the next generation, praised by Dryden, paraphrased by Pope, and then entirely neglected for a whole century. The first impression of an unbiassed reader who dips into the poems of Donne is unfavourable. He is repulsed by the intolerably harsh and crabbed versification, by the recondite choice of theme and expression, and by the oddity of the thought. In time, however, he perceives that behind the fantastic garb of language there is an earnest and vigorous mind, an imagination that harbours fire within its cloudy folds, and an insight into the mysteries of spiritual life which is often startling. Donne excels in brief flashes of wit and beauty, and in sudden daring phrases that have the full perfume of poetry in them. Some of his lyrics and one or two of his elegies excepted, the *Satires* are his most important contribution to literature. They are probably the first poems of their kind in the language, and they are full of force and picturesqueness. Their obscure and knotty language only serves to give peculiar brilliancy to the not uncommon passages of noble perspicacity. To the odd terminology of Donne's poetic philosophy Dryden gave the name of metaphysics, and Johnson, borrowing the suggestion, invented the title of the metaphysical school to describe, not Donne only, but all the amorous and philosophical poets who succeeded him, and who employed a similarly fantastic language, and who affected odd figurative inversions. (E. W. G.)

DONOVAN, EDWARD, naturalist, was author of many popular works on natural history and botany. In 1792 appeared the first volume of his *Natural History of British Insects*, which extended to sixteen volumes, and was completed in 1816. Although now superseded, this compilation did good service in its time. During the same period Donovan published *Natural Histories of British Birds*, in 10 vols 8vo. (1799–1819), of *British Fishes*, in 5 vols. (1802–1808), of *British Shells*, in 5 vols. (1800–1804), a series of illustrated works on *The Insects of India, China, New Holland, &c.*, in 3 vols. 4to (1798–1805), and *Excursions in South Wales and Monmouthshire* (1805).

To these works must be added his periodical entitled *The Naturalist's Repository*, a monthly publication, of which three volumes were completed (1823–1825), and an *Essay on the Minute Parts of Plants in general*. Donovan was author of the articles on natural history in Rees's *Cyclopædia*. In his old age this hard-working student and writer published a *Memorial respecting my Publications in Natural History*, in which he complains of the small profits accruing to him from the sale of his books. We have searched in vain for any biographical particulars of Donovan,—the only facts apparently recorded being that he was a fellow of the Linnean Society, and that he died in London, February 1, 1837.

DORAT, JEAN. See DAURAT.

DORCHESTER (the *Durnovaria* of the Romans), a parliamentary and municipal borough and market town of England, capital of the county of Dorset, situated on an eminence on the right bank of the Frome, 8 miles N. of Weymouth, and 120 miles from London by the old coach road, but some 20 miles farther by railway. It stands within a wide open tract of land, containing 3400 acres, held under the duchy of Cornwall, called Fordington Field. It is governed by a mayor, four aldermen, and twelve councillors, and returns one member to parliament. The population of the borough in 1871 was 6915; the area 635 acres. The

Arms of Dorchester

town, consisting chiefly of three spacious streets, is neat and pleasantly situated, and is nearly surrounded by fine avenues. St Peter's church is an ancient edifice in the Perpendicular style, containing some curious monuments. The grammar school has two exhibitions to St John's College, Cambridge, and one to each university. Of the other public buildings the principal are—the town-hall, with market-house, shire-hall, county prison, and county hospital; there is also a small county museum, containing many local objects of much interest. The cavalry barracks in the vicinity may also be noticed. There are also several almshouses and other charities, and a savings-bank. Market days, Wednesday and Saturday. The woollen manufacture of Dorchester was once considerable, and it was noted also for its ale, of which there are still some popular breweries. It is a place of considerable trade, and large sheep and lamb fairs are held there annually. The borough includes four parishes—All Saints, St Peter's, Holy Trinity, and Fordington. In the vicinity there are some interesting Roman remains, including an amphitheatre, the most perfect of its kind in England. The seats for the spectators are formed of masses of chalk, rising 30 feet above the arena. This amphitheatre when perfect is supposed to have been capable of accommodating 13,000 spectators. The camp called Poundbury, to the N.W. of the town, is probably Roman, and well worthy of examination. Durnovaria was one of the principal stations in England of the Romans, by whom it was surrounded with a wall and fosse, part of the former being still standing. Here Judge Jeffreys's "bloody assize" was held in September 1685, when 292 prisoners were sentenced to death.

DORDOGNE, an inland department in the S.E. of France, taking its name from the river which traverses its centre from east to west, and formed from nearly the whole of Périgord, a part of Agenais, and small portions of Limousin and of Angoumois. It is bounded on the N. by Haute Vienne, W. by Charente and Charente Inférieure, S.W. by Gironde, S. by Lot-et-Garonne, and E. by Lot and Corrèze, and lies between 44° 45' and 45° 42' N. lat., and from 0° 1' 51" to 1° 26' 49" W. long. Its surface is beautifully variegated, comprising small mountains,—some

of which are covered with vines and crowned with wood, and others rocky and barren,—large plateaus, and a few pleasant valleys. In the north it is wild and sterile, and in the west is covered with forests of pine, but the splendid valley watered by the Dordogne is rich in vines, fruit trees, and cereals. The climate is generally agreeable and healthy, but rather humid, especially in the south. Dordogne is watered by 11 rivers and more than 600 streams, all tributaries of the Dordogne except the Bandiat and the Dropt. The Dordogne itself is formed by the union of two mountain streams, the Dor and the Dogne, which rise in Mont d'Or, Puy-de-Dôme, and unite after a short course. Sufficient corn is grown in the department for home consumption. The cultivation of the vine occupies about a tenth of its surface, and its red and white wines are in high repute. Its truffles are considered the best in France. In the forests the prevailing trees are the oak and chestnut. The fruit of the latter is much used both as food by the people and for fattening hogs. The walnut is extensively cultivated for making oil. Dordogne is rich in various kinds of minerals, iron is very abundant, and there are found also copper, lead, manganese, coal, marble, alabaster, lithographic stones, lime of gypsum, &c. The chief branches of industry are the working in metals, particularly iron and steel, the manufacture of paper, and boat-building, but there are also produced coarse woollens, serges, leather, earthenware, hosiery, vinegar, brandy, and liqueurs. Dordogne is divided into the arrondissements Périgueux, Bergerac, Nontron, Ribérac, and Sarlat, with 47 cantons and 582 communes. The chief town is Périgueux. The total area is 3545 square miles, and the population in 1872 numbered 480,142.

DORIA, ANDREA (1466–1560), the famous Genoese admiral, was born at Oneglia in 1466. He belonged to a noble family, several of whose members, both before and after his time, distinguished themselves in the history of Genoa. Having lost both his parents in his youth, he embraced the military profession, and served in the papal guards and under various princes of Italy. It was not until he was fifty years of age that he entered into the service of Francis I. of France, who gave him the command of his fleet in the Mediterranean. In this position he preserved that spirit of independence which is so natural to a sailor and a republican. When the French attempted to render Savona, long the object of jealousy to Genoa, its rival in trade, Doria remonstrated strongly against the measure; this irritated Francis to such a degree that early in 1528 he ordered his admiral Barbesieux to sail for Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. Doria, however, retired with all his galleys to a place of safety, and closing with the offers of the emperor Charles V., returned his commission to Francis, and hoisted the imperial colours. To deliver his country, now weary alike of the French and the imperial yoke, from the dominion of foreigners, was Doria's highest ambition; and the favourable moment had presented itself. Genoa was afflicted with the pestilence, the French garrison was ill paid and greatly reduced, and the inhabitants were sufficiently disposed to second his views. Before the close of the same year (1528) he sailed to the harbour with thirteen galleys, landed five hundred men, and made himself master of the gates and the palace with very little resistance. The French governor with his feeble garrison retired to the citadel, but was soon forced to capitulate, upon which the people speedily levelled the citadel with the ground. It was now in Doria's power to have declared himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle what form

of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed, with his approval, that republican form of government which, with little variation, subsisted until 1815. His disinterested patriotism won for him the appointment of censor for life and the title "Father and Liberator of his Country." Doria afterwards engaged in an expedition against the Turks, from whom he took Corua and Patras. He also co-operated with Charles V. in the reduction of Tunis and Goulette. In 1547 two successive attempts were made against his life by Fieschi and a Genoese emigrant of the name of Giulio Cibo. He resigned his command in 1556, and died at Genoa in November 1560, being then ninety-four years of age.

DORIANS, the name by which one of the two foremost races of the Hellenic or Greek people was commonly known, the other being the Ionic. These two races, if the term may here be rightly used, stand out in marked contrast, as exhibiting different types of character, which have their issue in different modes of thought and forms of government. But when from a consideration of their political and intellectual development we endeavour to work our way backward to the origin and early history of these races, we find ourselves confronted by traditions which show little consistency, or which even exclude each other. The writer who speaks with the greatest confidence on this subject is the perfectly truthful man who well earned his title to be known as the father of history; but Herodotus, although thoroughly to be trusted as to all that he relates from his own experience, could not rise much above the standard of his age in dealing with alleged matters of fact, nor could he see that the eking out of theory by conjecture is an illegitimate process. Herodotus then, in speaking of the Athenians and Spartans as standing at the head severally of the Dorian and Ionian races, states positively that the Ionian was a Pelasgic, the Dorian a Hellenic people; that the former had always been stationary, while the latter had many times changed its abode. In the time of Deucalion, he asserts, the Dorians, or rather the tribe or tribes which were afterwards to be called Dorians, inhabited Phthiotis, by which he probably understands the southern portion of the great Thessalian plain. Afterwards, under their eponymus Dorus, they occupied Histiaeotis, which he describes as the region under Ōssa and Olympus. They had thus migrated from the most southerly to the most northerly parts of the great plain which is drained by the Peneius. The next migration was to the highlands of Pindus, the chain which runs down at right angles from the Cambunian range, or the westward extension of Olympus. Here, he says, they were known not as Dorians, but as Macedonians. A later southward migration brought them into Dryopis, whence they made their way into the Peloponnesus, and it would seem were then only first known as Dorians (Herod. i. 56).

If we examine the statement thus boldly advanced, we shall find at each step that the ground becomes more uncertain. We may indeed, in order to explain it, assume that the Pelasgic race was closely akin to the Greek, and that their language stood midway between the Hellenic and the Latin; but if we do so we are reasoning strictly from the point of view of modern philology, and really abandoning that of Herodotus, who says that, if he may judge from the Pelasgian populations which he found at Placia, Scylace, and Creston, the Pelasgians generally must have spoken a barbarous dialect, i.e., a dialect unintelligible to a Greek. He is thus driven to assume, first, that the Attic tribes had been Pelasgic before they became Hellenic, and that the change was accompanied by a change of language (Herod. i. 57). Elsewhere (ii. 51) he speaks of the Athenians as being already Greek or Hellenic before

the Pelasgians became their neighbours, and adds that the latter came in time to be reckoned Hellenic also. We thus see, without going further, how vague and misty were the notions of Herodotus; but we have to note further that the account here given of the Dorians and Ionians is said to apply to the time of Cræsus, and thus, down to his age, the Ionians had been stationary in their original abodes, these abodes in his day being assuredly not in the Peloponnesus. Yet he can assert elsewhere that the Peloponnesians had been their original home, and that they had been expelled from it by the Achæans (i. 145). But, apart from the fact that the poets of the *Iliad* and the *Odyssey* know nothing of any expulsion of Ionians from Peloponnesus, the difficulties are increased if we betake ourselves to the tribal genealogies which the Greeks regarded as undoubtedly historical documents. We have then, on the one side, the assertion that the Ionians were originally non-Hellenic and Pelasgian; on the other, the Iapetid genealogy speaks of Dorians, Achæans, Ionians, and Æolians, as being all sprung from Hellen,—Xouthus, the son of Hellen, being the father of Ion and Achæans. If, therefore, we were to argue from these data, we should have to conclude that, as the tribes just mentioned were all Hellenic, and as the Ionians were Pelasgians, some Pelasgians at least were Hellenes. But the whole process would be deceptive, for as Ion and Achæans are here the sons of Xouthus, the Ionians would be expelled from the Peloponnesus by their nearest brethren. It is, however, more important to note that the opinion of Herodotus respecting the Pelasgi was distinctly contradicted by another, which had the countenance of Strabo, Plutarch, and other writers. Strabo speaks of them as virtually nomadic tribes; and the story even went that they received their name, Pelasgi = Pelargoi, or Storks, from their wandering habits. It is difficult to resist the inference of Sir G. Cornewall Lewis that this radical inconsistency in the views respecting the Pelasgians is a proof that they rest on no historical basis (*Credibility of Early Roman History*, i. 282). Further, there is the extreme unlikelihood that the tribes afterwards known as Dorians should for a certain period have been called Macedonians, or rather, as Herodotus implies, that they should more than once change their name. The assertion that they were called Macedonians involves a fresh contradiction, for elsewhere Herodotus asserts that the Macedonians were not Hellenic at all, although they were governed by chiefs of genuine Greek descent. Nor is our position improved if we choose to prefer the statements of the genealogies in preference to those of Herodotus or other historians, on the ground that the national tradition by which these genealogies were handed down must be trustworthy, for the descent in one genealogy is often directly contradicted by that of another, and not unfrequently, and indeed even generally, the genealogy betrays the nature of the materials from which it has been made up. Thus, for instance, Dorus, the eponymus of the Dorians, has as his sister Protogeneia (the Early Dawn), who, being wedded to Zeus, the god of the gleaming heaven, becomes the mother of Æthlius, the toiling sun, who is the father of Eudymion, that is, of the sun-god who sinks to sleep in Lethe, the land of forgetfulness. Finally, we have to note the fact that, in the Hellenic world as elsewhere, tribes bearing the same name were found separated by great distances; and in such cases traditions always sprang up, not merely asserting their connection, but accounting for it. Thus they found Achæans in Thessaly and Achæans in the Peloponnesus; and it was said, not merely that the former passed southwards across the isthmus of Corinth, but that they were led by the barbarian Pelops from Phrygia. The same process connected the Peloponnesian Dorians with the

Dorian clans who dwelt between Cæta and Parnassus, and spoke of the latter as the stock from which the Spartans sprang, to the great benefit of the insignificant clans, who thus acquired a foremost rank in the Hellenic world.

All that we can do, then, is to bring together the genealogies which refer in any way to Dorus and his supposed descendants the Dorians, and then gather from historians and geographers the various regions in which Dorians were found during ages which may reasonably be regarded as historical. The result of the former process will scarcely appear satisfactory. We have noticed one genealogy which represents Dorus as the son of Hellen; but in the Etolian genealogy he is the son of Apollo and Phthia, and is slain by Ætolus in the land which from him was called Etolia (Grote, *Hist. Gr.*, i. 140). The great tradition which connects the Dorians of the Peloponnesus with their more noteworthy namesakes is the legend which relates the return of the Heracleids, or descendants of Hercules, who, after the death of that hero, had been compelled to take refuge in Athens. Hyllus, in his exile, is adopted by the Dorian king Ægimius, the father of Pamphylus and Dymas, who with Hyllus become the eponymi or name-givers of the three tribes found in Dorian communities generally, and known as Hylleans, Pamphylians, and Dymanes, Hyllus being more particularly illustrious as the forefather of Eurysthenes and Procles, the progenitors of the two houses from which the Spartan kings were always elected. But this legend, like the rest, was variously related, and, according to the version of Plato, the return of the Heracleids would be rather a return of the Achæans to the Peloponnesus.

We cannot, however, question the fact that the Dorian race was widely extended, that it was found, like the Ionians, in various portions of the Hellenic world, separated by considerable distances of land or sea, and that the people who bore this name were singularly active in the work of colonization. They are found not only in all parts of the Peloponnesus but in the islands of the Ægean, and on the coasts of Asia Minor; and from the foremost Dorian cities went forth, it is said, the colonists who were to carry the Hellenic name and Hellenic culture far to the east and the west. Thus Corinth became the mother city of Coreyra and Syracuse, and from these sprang Epidamnus, Camarina, Ambracia, Potidea. The Dorians of Crete and Rhodes sent forth the settlers of the Sicilian Gela, and Gela in turn became the parent of the mightier Agragas, or Agrigentum, while to Megara is assigned the origin of Byzantium, the future home of Roman Cæsars and of Ottoman Sultans. These several communities exhibit a general likeness in their dialect, their art, and their polity. Their civilization assumed a magnificent phase in the splendour of Corinth and the great Dorian cities of Italy and Sicily. Their powers of resistance were attested by the success with which their colonies were planted in regions occupied by powerful and hostile tribes, who failed to overthrow them simply because they lacked the Dorian power of cohesion. Yet with the Dorians this power was subjected to strictly defined bounds of action. All Dorian cities might feel a pride in belonging to the great Dorian stock, and the parent city might claim certain prerogatives in its colonies; but each city was for them nevertheless an absolute unit, with whose independence no other city had any right to interfere, even though this interference might have for its object the establishment of a pan-Hellenic union. Any movements in this direction were sure to rouse the keenest and most persistent opposition of the Dorian Greeks; and thus we can understand the nature of the quarrel which was fought out between Sparta and Athens, and which ended in the ruin of the great Ionian city, whose imperial rule must otherwise have checked, and may perhaps have rooted out,

this fatal instinct of isolation. The Spartans, who stood at the head of the Dorian portion of the Greek world, are regarded by K. O. Müller, in his *History of the Dorians*, as exhibiting in their institutions and government the true type of the race. This theory is strenuously combated by Grote, *History of Greece*, pt. ii. ch. 6; and at the least it must be said that if they displayed the true Dorian type, that type must have been completely lost among all the other Dorian tribes. The Spartans occupied Laconia strictly as an army of occupation, and carrying out inflexibly their rigid system, they opposed an uncompromising resistance, not only to luxury, but generally to art, refinement, and speculation (Cox, *History of Greece*, i. 72). No such condition of things is found even in Crete, from which Sparta was supposed to have derived her special institutions. Not only is their reputation as models of Dorism altogether undeserved, but it probably would have been exceedingly distasteful to the countrymen of Leonidas, Archidamus, and Agesilaus. (G. W. C.)

DORIS, the name which, in the time of Herodotus and later writers, designated the little territory which lay to the south-west of the Mahan Gulf, and between the ranges of Ceta and Parnassus, bounded by the lands of the Phocians on the east, of the Etolians on the west, of the Mahans and Epicnemidian Locrians on the north, and of the Ozolian Locrians on the south, the whole being barely thirty miles in length by ten at its greatest width. The inhabitants were divided into the four townships of Boion, Cytunion, Erneuus, and Pindus. Of their history down to the time of the invasion of Xerxes we know nothing, and probably they had none, nor is there more to be said than that they then consulted their interests by submitting to the Persian king. This confederacy of four little townships was honoured by the Spartans as their metropolis, or the home from which the Dorians had come who achieved the conquest of the Peloponnesus—a tradition which has been noticed in the article DORIANS. The political insignificance of Doris is to be ascribed to the fact that it had no seaboard. The only other Greek communities in like plight were those of Arcadia or the Peloponnesian highlands, and both Doris and Arcadia remained far in the rear of Hellenic development generally.

DORKING, a market town of West Surrey, England, situated on a small brook, a tributary of the Mole, 29 miles S of London by rail. The town is well built and clean, and occupies a picturesque position in a sheltered vale near the base of Box Hill. The parish church of St Martin's is a handsome edifice rebuilt in 1873; and St Paul's district church, erected in 1857, is a building of some pretension. Lime of exceptionally good quality is burnt to a large extent in the neighbourhood, and forms an important article of trade, it is derived from the Lower Chalk formation. Dorking has long been famous for a finely-flavoured breed of fowl, distinguished by their having five claws. Several elegant mansions are in the vicinity of the town, notably that of Deepdene, containing a gallery of sculpture collected here by the late Thomas Hope, the author of *Anastasis*. The Roman road which crossed from the Sussex coast to the Thames, passed close to Dorking. The population of town is about 4800, that of parish in 1871 was 8567.

DORLEANS, Louis, (1542–1629), a minor French poet and political pamphleteer, and a prominent partisan of the Catholic League, was born in 1542, probably at Paris, though one of his biographers states that Orleans was his birthplace. He studied under Jean Danrat, and after taking his degree in law began to practise at the bar with but slight success. He added little to his reputation by writing indifferent verses, and it was not until the League had taken the daring step of arresting the royalist members of parliament, that he was brought into prominence by being

appointed its advocate-general. He maintained the position and claims of the League in language that was always strong and often insolent, going so far as to express regret that the king of Navarre and the prince of Condé had not been assassinated. He was, however, courageous enough to intercede with the duke of Mayenne for the inhabitants of Paris, but without effect. After this failure he continued the publication of violently-worded pamphlets intended to render the accession of Henry impossible. One of these, *Le Banquet et Après-dînée du Comte d'Arête*, in which he accused Henry of insincerity in his return to the Roman Catholic faith, was so scurrilous as to be disapproved of by many members of the League. When Henry at length entered Paris, Dorléans was among the number of the proscribed. He took refuge in Antwerp, where he remained for nine years. At the expiration of that period he received a pardon, and returned to Paris, where he had not been long before he was imprisoned, for sedition. The king, however, ordered him to be set free after he had been three months in the Conciergerie, and this generous conduct had the effect of attaching him ever afterwards to the cause of Henry. His last years were passed in obscurity, and he died in 1629 at the age of eighty-seven. Dorléans's political pamphlets are now exceedingly scarce. His chief poem, *Renaud* (Paris, 1572), is a poor imitation or translation of part of the *Orlando Furioso*.

DORMOUSE, the common name of a family of small rodents (*Myoxidae*), generally regarded as intermediate between mice and squirrels. It contains 12 species, distributed over the temperate parts of the great Palearctic region from Britain to Japan, and throughout the greater portion of Africa. The Common Dormouse (*Myoxus avellanarius*) occurs in most parts of Europe, and is the only species found in Britain. It is an active little creature, measuring about three inches long, with a thick bushy tail of nearly similar length. Its posterior legs are slightly longer than those in front, and both fore and hind feet form prehensile organs, whereby the dormouse climbs along the twigs of the low bushes among which it lives, and in which it builds a neat round nest formed of leaves. It is a shy and timid animal, choosing the recesses of woods for its habitation, and seldom showing itself by day; in confinement, however, it is readily tamed and becomes very familiar. It feeds, as its specific name implies, on hazels, and is also partial to berries, haws, and grain. These it eats, either sitting on its haunches or suspended by its hind feet, and holding them between its forepaws like a squirrel. In autumn it grows very fat, and lays up a store of food for winter use,—retiring at the commencement of the cold season to its nest, and curling itself up into a ball, when it becomes dormant. A warmer day than usual restores it to temporary activity, and then it supplies itself with food from its autumn hoard, again becoming torpid till the advent of spring finally rouses it. Owing to this hibernating habit it is known as the Sleeper, while the name dormouse has reference to the same peculiarity. The young of the dormouse are generally four in number, and these, according to Bell, are produced twice a year. They are born blind, but in a marvellously short period are able to cater for themselves, and their hibernation begins later in the season than with the adult form. The fur of the dormouse is of a tawny colour above, and paler beneath, with a white patch on the throat. The Fat Dormouse (*Myoxus glis*) is larger than the British species, and is the one most commonly found in Southern Europe.

DORNBIRN, or DORNBÜHREN, a straggling but well-built township of Austria, in Tyrol, about six miles S of Bregenz, situated on the right bank of a stream known as the Dornbirn Ach, which flows into the Lake of Con-

stance. It has upwards of 8000 inhabitants, ranks as the principal market-place in the Vorarlberg, and carries on iron and copper smelting and the manufacture of cotton cloth and worked muslin.

DOROGOBUSH, a town of Russia in Europe, in the government of Smolensk, about 55 miles E of the city of that name, on the banks of the Dnieper, in $54^{\circ} 55'$ N. lat. and $33^{\circ} 17'$ E. long. It has twelve churches, and still preserves its ancient earthen fortress, with its ramparts and ditch, within the precincts of which are situated the cathedral, the courthouse, and two victualling stores. Its manufactures are of no importance, but it maintains an extensive trade with various parts of Russia, and even with foreign countries, in tallow, leather, and hemp. First mentioned in 1300 as the object of a contest between Alexander of Smolensk and Andrew of Viasma, Dorogobush continued through the 13th century to share in the vicissitudes of the neighbouring principalities, passed in the 15th successively into the power of the Lithuanians and the Poles, and was finally united with Russia in 1667. It was partially burned by the French on their retreat from Moscow. Population in 1873, 7905, of whom only a very few are Catholics and Jews.

DOROGOI, or **Дорогои**, a town of Roumania, in the northern part of Moldavia, about 80 miles north-west of Jassy, on the Shiska, a tributary of the Pruth. It has about 10,000 inhabitants, a large transit trade with the products of Northern Europe, and several important annual fairs; but its buildings are of a poor description.

DOROTHEUS, a professor of jurisprudence in the law school of Berytus in Syria, and one of the three commissioners appointed by the emperor Justinian to draw up a book of Institutes, after the model of the *Institutes* of Gaius, which should serve as an introduction to the *Digest* already completed. His colleagues were Tribonian and Theophilus, and their work was accomplished in 529. Dorotheus was subsequently the author of a commentary on the *Digest*, which is called the *Index*, and was published by him in 542. Fragments of this commentary, which was in the Greek language, have been preserved in the *Scholæ* appended to the body of law compiled by order of the emperor Basilus the Macedonian and his son Leo the Wise, in the 9th century, known as the *Basilica*, from which it seems probable that the commentary of Dorotheus contained the substance of a course of lectures on the *Digest* delivered by him in the law school of Berytus, although it is not cast in a form so precisely didactic as the *Index* of Theophilus.

DORP, a town of Prussia, in the government of Düsseldorf, 17 miles north-east of Cologne, which, like Barmen and many other towns in the valley of the Wupper, has since 1849 rapidly grown into importance as a centre of manufacturing industry. Tobacco, paper, steel, and iron wares are the principal objects of its activity. In 1872 the population amounted to 10,689.

DORPAT, in German frequently *Dörpt*, in Russian *Derpt* or *Yurief*, in Esthonian *Tartoma*, a city of Russia in Europe, in the government of Livonia, situated on both banks of the Embach, 157 miles north-east of Riga, in $58^{\circ} 23'$ N. lat. and $26^{\circ} 23'$ E. long. The principal part of the town lies to the south of the river, and the more important buildings are clustered round the two eminences known as the Domberg and the Schlossberg, which, in the Middle Ages, were occupied by the citadel, the cathedral, the episcopal palace, the monastery, and the houses of the wealthier inhabitants. Owing to the great conflagration of 1777, the actual town is almost entirely of modern erection; and its fortifications have been transformed into promenades. Besides one Roman Catholic, three Lutheran, and two Russian churches, a hospital, and an orphanage, a

veterinary institute founded in 1846, the economical society of Livonia, an Esthonian learned society, and a medico-physical society, it possesses a famous university, with an observatory, an anatomical theatre, a botanical garden, and a library of about 250,000 volumes, which are housed in a restored portion of the cathedral, burned down in 1596. This university, which renders the town the great intellectual centre of Livonia, preserves the Teutonic traditions of its earlier days, and is much more German than Russian in its culture. It was founded by Gustavus Adolphus in 1632; but in 1699 teachers and students removed to Pernau on the advance of the Russians, and on the occupation of the country by Peter the Great again took flight to Sweden. In spite of the stipulation of the treaty of 1710 and the efforts of the Livonian nobles, it was not till 1802 that its restoration was effected under the patronage of Alexander I.; but since that date its history has been one of considerable prosperity. It possesses 42 ordinary professors, a total teaching staff of 73 members, and upwards of 800 students. The astronomical department is especially famous, owing partly to the labours of Otto Struve, and partly to its possession of Fraunhofer's great refracting telescope, presented by the emperor Alexander I. The manufacturing industry of the town is very slight, but it carries on a good trade, and has six great markets in the year. Population in 1873, 20,780.

The foundation of Dorpat is ascribed to the grand duke Yaroslav I., and is dated 1030. In 1223 the town was seized by the Teutonic Knights, and in the following year Bishop Hermann erected a cathedral on the Domberg. From that date till about 1559, the greatest prosperity was achieved under the patronage of the independent episcopal see, and the population reached as high as 50,000. In 1559, the town was captured by the Russians under Peter Ivan Shiuski, but in 1582 it was yielded by treaty to Stephen Bathori of Poland. In 1600, it fell into the hands of the Swedes, in 1603 reverted to the Poles, and in 1625 was seized by Gustavus Adolphus. The Russians again obtained possession in 1666, but once more yielded before the Swedes, and did not effect a permanent occupation till 1703. In 1703 the bulk of the population was removed to the interior of Russia; but before long the town began to receive better treatment from the victors, and when in 1777 it suffered so severely from the conflagration already mentioned, it obtained valuable assistance in the work of restoration from Catherine II.

D'ORSAY, ALFRED GUILLAUME GABRIEL, COUNT (1798–1852), a celebrated leader of society in Paris and London, who added to the attractions of dandyism those of high intellectual and artistic gifts, was born at Paris in 1798. He was the son of General D'Orsay, from whom he inherited the exceptionally handsome person which contributed so much to his social success. Through his mother he was grandson by amorganatic marriage of the king of Württemberg. In his youth he entered the French army, and served as a *garde du corps* of Louis XVIII. In 1822, while stationed at Valence on the Rhone, he formed that acquaintance with the earl of Blessington and his family which affected the whole course of his future life. The acquaintance quickly ripened into intimacy, and at the invitation of the earl he accompanied the party on their tour through Italy. In the spring of 1823 he met Lord Byron at Genoa, and the published correspondence of the poet at this period contains numerous references to the count's gifts and accomplishments, and to his peculiar relationship to the Blessington family. A diary which D'Orsay had kept during a visit to London in 1821–2 was submitted to Byron's inspection, and was much praised by him for the knowledge of men and manners and the keen faculty of observation it displayed. On the 4th December 1827, Count D'Orsay married Lady Harriet Cardiner, a girl of fifteen, the daughter of Lord Blessington by his first wife. The union, if it rendered his connection with the Blessington family less ostensibly equivocal than before,

was in other respects an unhappy one, and a separation took place soon after the death of Lord Blessington, which occurred in 1829. When the widowed countess returned to England she was accompanied by Count D'Orsay, and the two lived under the same roof, first at Seamore Place and then at Kensington Gore. Their house soon became a resort of the fashionable literary and artistic society of London, which found an equal attraction in host and in hostess. The count's charming manner, brilliant wit, and artistic faculty were accompanied by benevolent moral qualities, which endeared him to all his associates. His skill as a painter and sculptor was shown in numerous portraits and statuettes representing his friends, which were marked by great vigour and truthfulness, if wanting the finish that can only be reached by persistent discipline. Count D'Orsay had been from his youth a zealous Bonapartist, and one of the most frequent guests at Gore House was Prince Louis Napoleon. It was to Paris, therefore, that he naturally resorted in 1849, after the breaking up of the establishment at Gore House in consequence of his bankruptcy. The countess of Blessington, who had accompanied him, died a few weeks after their arrival, and he endeavoured to provide support for himself by adopting the profession of a portrait painter. He was deep in the counsels of the prince president, but the relation between them was less cordial after the *coup d'état*, of which the count had by anticipation expressed his strong disapproval. His appointment to the post of director of fine arts was announced only a few days before his death, which occurred on the 4th August 1852.

Much information as to the life and character of Count D'Orsay is to be found in Madden's *Literary Life and Correspondence of the Countess of Blessington* (1855).

DORSET, an English county, situated on the south-western coast. In British times, previous to the landing of Caesar, it was inhabited by a tribe which Ptolemy calls the Durotriges, and which, upon no good authority, but not without probability, has been identified with the Morini, the occupants of a part of the opposite coast (*extremi hominum Morini*, *En viii.* 727), the two appellations being apparently of similar import, and referring to their location on the sea-shore. Under the Romans this county constituted a portion of *Britannia Prima*; and the Saxons called it Dornsæta, or Dorsæta (a word involving the same root, Dwr, water), and included it in the kingdom of Wessex.

On the north Dorsetshire is bounded by Somersetshire and Wiltshire, on the east by Hampshire, on the west by Devonshire and a part of Somersetshire, whilst the British Channel washes the whole of its southern coast. Its form is very irregular; the northern boundary has a considerable angular projection in the middle; its southern coast runs out into various points and headlands; and the western inclines towards Devonshire with an uneven line. Its greatest breadth from north to south is about 35 miles, and its length from east to west 55. Its circumference, including 627,265 acres, is nearly 160 miles. In 1871 the population was found to be 195,537,—having increased from 114,452 in 1801 and 175,054 in 1841. 111,731 acres were under corn-crops, and 60,633 under green-crops. The males numbered 95,616, the females 99,921.

Dorset is divided into 35 hundreds, containing more than 300 parishes, 8 boroughs, 22 liberties, and 12 market towns, the principal of which are Dorchester, Bridport, Sherborne, Lyme-Regis, Shaftesbury, Weymouth and Melcombe-Regis, Poole, and Blandford. Only 10 members are returned to parliament, instead of 20 as before the first Reform Act. The county itself sends three; Dorchester, Bridport, Poole, Shaftesbury, and Wareham one each, and

Melcombe-Regis and Weymouth two between them. Dorsetshire forms a part of the see of Salisbury. It originally fell under the wide jurisdiction of the ancient sees of Dorchester in Oxfordshire and of Winchester, till the foundation of the bishopric of Sherborne, 705 A.D., and when that see was transferred to Salisbury it still remained a part of it, till in 31st Henry VIII. it was annexed to the newly-erected bishopric of Bristol, and so continued till 1836, when its ancient connection with Salisbury was revived, and still continues.

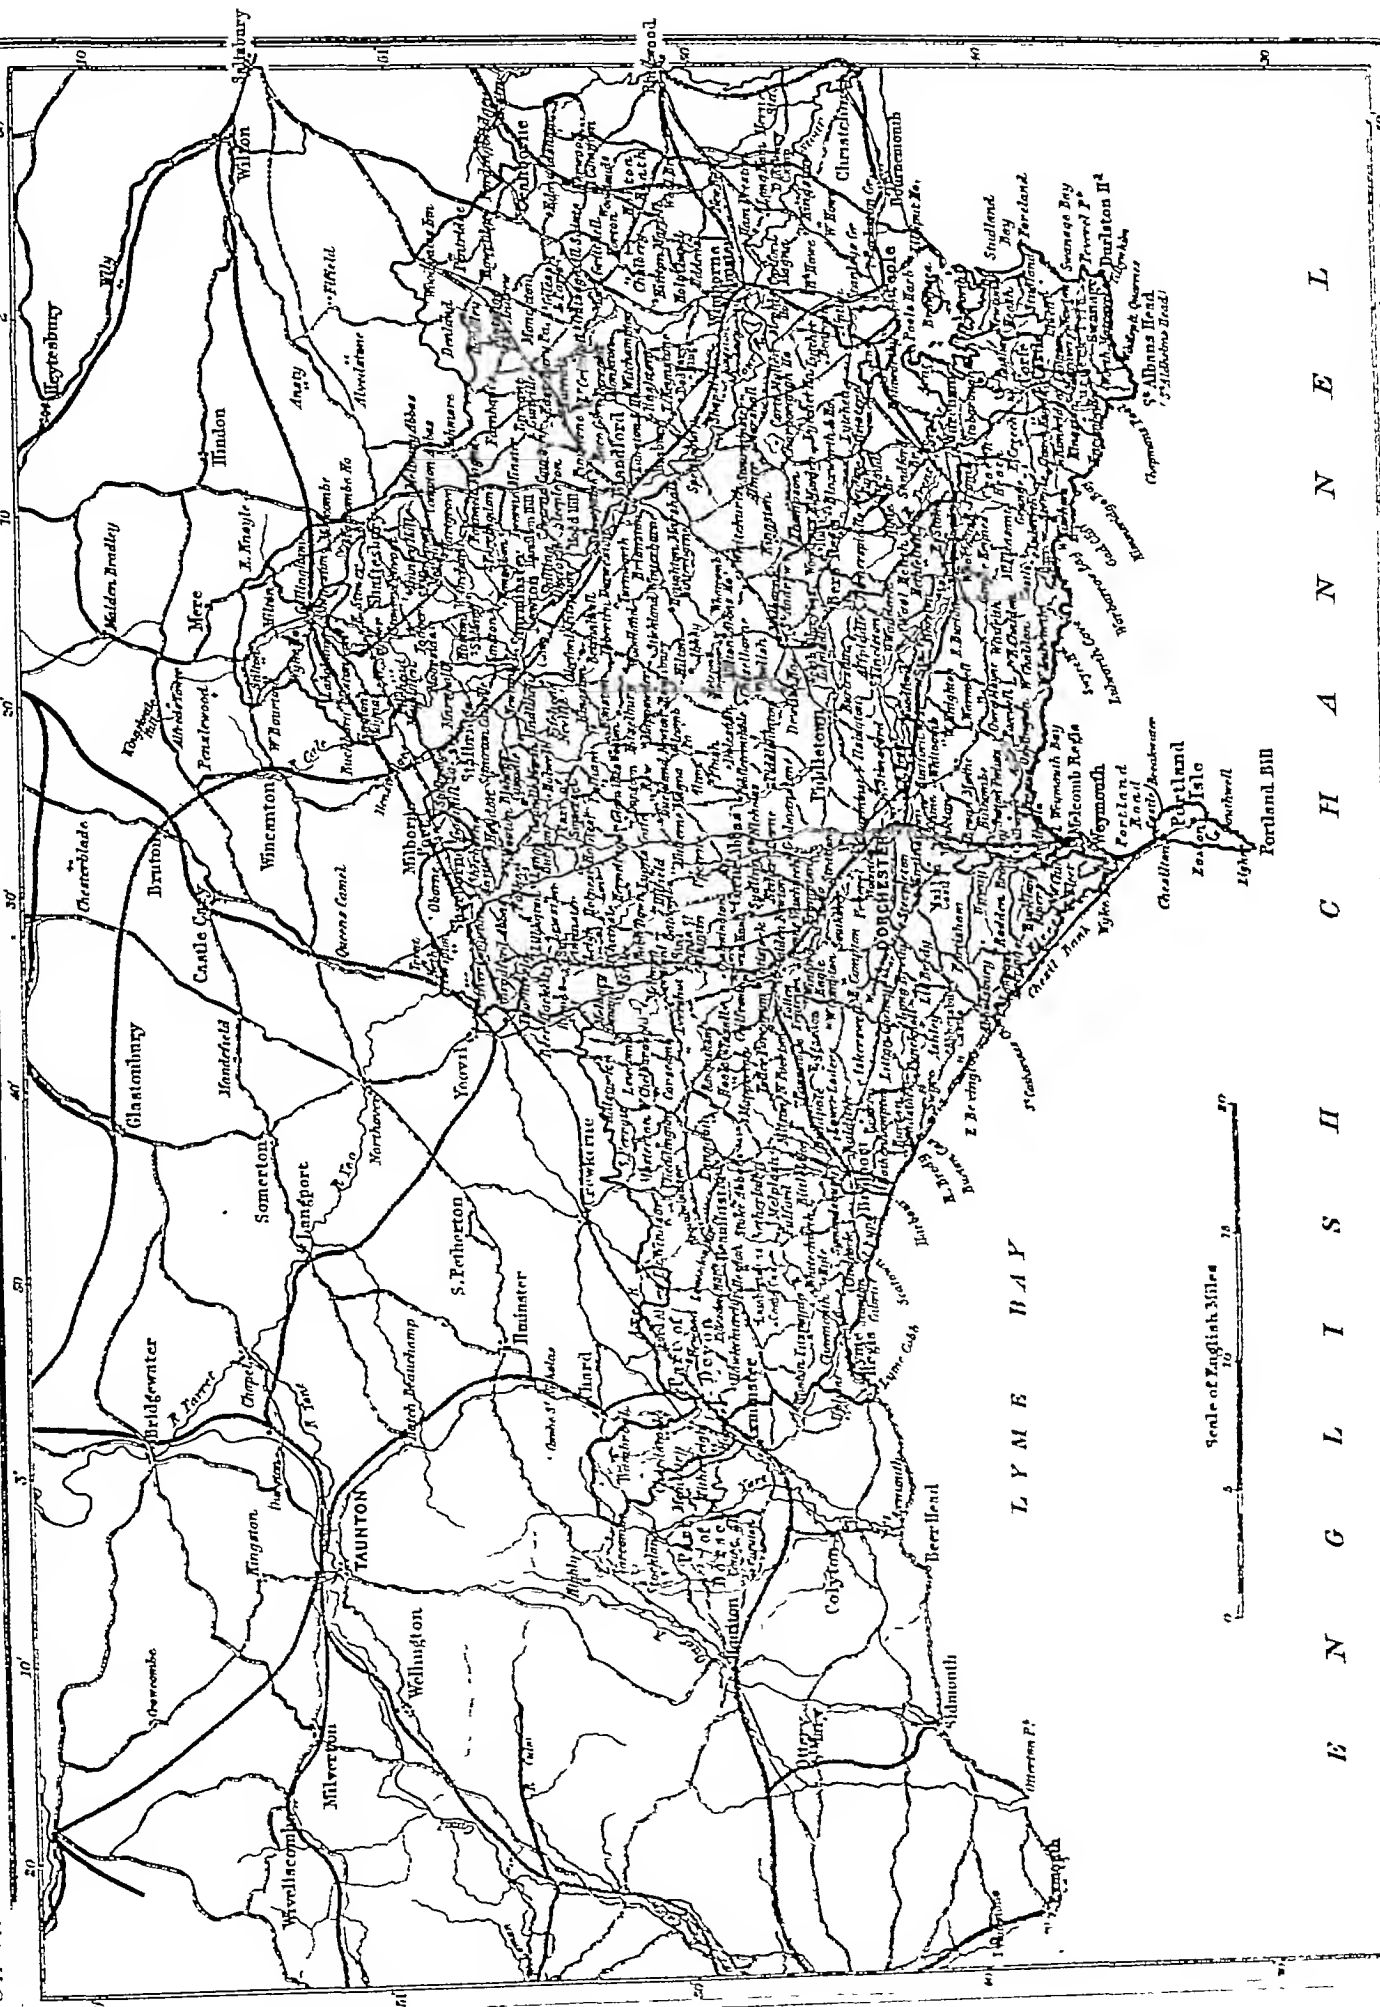

Branches of the London and South-Western Railway, or in connection with it, enter the county from Southampton, Salisbury, and Bath, meet near Wimborne, and continue to Poole, Wareham, Dorchester, and Weymouth, which last two places are also reached by a branch of the Great-Western from Yeovil, with a drop-line to Bridport at Maiden-Newton. The main line of the London and South-Western likewise touches the north of the county near Shaftesbury, Gillingham, and Sherborne.

The surface of Dorsetshire is hilly and uneven. Throwing out for the present the consideration of the coast-line in Purbeck, Portland, and to the westward, and proceeding in the direction of from S.E., to N.W., we find a descending series of formations, commencing from the Tertiaries, which occupy an almost equilateral triangle, and include the towns of Wareham, Poole, Wimborne, and Cranborne; passing through a band of Chalk some ten or twelve miles in breadth, in which the chief town Dorchester and Blandford are situated, and which is fringed by a thin belt of Greensand; and thence to the Oolitic beds in the north-east, and the Lias at Bridport and the south-west. The three systems thus roughly indicated have been popularly divided into the Sands, the Chalks, and the Clays. It is, of course, the last which has won for this county the somewhat exaggerated, and not uncontested, designation of "the garden of England;" though the rich wide vale of Blackmore, and the luxuriant pastures and orchards of the extreme west may fairly support the claim. The Downs of the Chalk district, formerly so celebrated as sheep-walks, have been rapidly disappearing of late years under the influence of a more scientific system of agriculture, though still the stock of sheep pastured in the county amounts to between 500,000 and 600,000. Even in the sandy region, cultivation is advancing, and detached portions are improved, though there is still much waste land, dreary and barren, hardly supporting, even in the summer months, a few sheep and cattle, and supplying the scattered cottars with heath and turf for fuel.

Dorsetshire is not generally speaking a well-wooded county, though much fine timber may be seen, not only in the richer and deeper soils, but likewise in the sheltered valleys of the Chalk district, and more especially upon the Greensand. The views from some of the higher hills, which constitute, as it were, the back-bone of the county, are often vastly extensive, ranging on many points from the Needles to the very utmost limit of the Mendips and Quantock Hills, where they sink into the Bristol Channel.

The Dorsetshire air is remarkably mild and salubrious, and in some sunnier spots of the coast, such as Abbotsbury, even tropical plants are found to flourish. Weymouth has long been celebrated as a watering-place, and owing to the general calmness of the sea there, its pleasant situation, and commodiousness for bathing, it still maintains considerable consequence. The sea-side villages of Swanage, Lulworth, and Charmouth also, though more difficult of access, and affording less accommodation for visitors, abound with many quiet and enjoyable charms.

The chief port of the county is Poole, situated on an estuary formed by the mouth of the Frome. Its entrance is defended by Brownsea Castle,—not, however, a military

E N G L I S H L Y M E B A Y C H A N N E L

Scale of English Miles

fortress, but simply a castellated mansion,—and it is very secure in all winds. It was formerly the chief place for equipping ships for the Newfoundland fishery; and a brisk trade was carried on from it with Spain, Portugal, and the Mediterranean; but it is now chiefly occupied with a coasting trade, and the export of potters' clay. Swanage, Weymouth, Bridport, and Lyme have harbours capable of admitting small vessels only. The magnificent breakwater at Portland, of which the first stone was laid by Prince Albert in 1849, provides a harbour of refuge which is nearly land-locked, and a secure anchorage of almost unlimited extent, and of easy access to the largest class of vessels.

The principal rivers of Dorsetshire are the Frome, the Stour, the Piddle, and the Ivel. The Frome rises in the north-western part of the county, near Evershot, and passing by Dorchester, reaches Poole, and falls into its bay. The Stour enters this county from Wiltshire, near Gillingham, and, pursuing a southern and south-eastern direction, enters Hampshire. The Piddle rises in the north, and, flowing to the south-east, falls into Poole Bay. The Ivel, anciently the Yeo, has its origin from several springs near Horethorn, in a hill north-east from Sherborne, from which town it flows into Somersetshire, and falls into the Parret, near Yeovil.

Although neither coal nor any metallic ores have ever been found in Dorsetshire, the stone quarries of Purbeck and Portland have long been celebrated. Purbeck, though called an island, is more properly a peninsula, of an irregular oval form, about twelve miles in length and seven in breadth. It consists, according to Mantell, of Cretaceous, Wealden, and Oolitic strata in their regular order of succession, and highly inclined in their section towards Swanage Bay, where they are easily detected. At Handfast Point the chalk is discovered, its lower division dipping at a considerable angle, then comes a layer of firestone, next gault, and then greensand—all inclined, then, at Swanage Bay, a thick wealden bed, to the south of which are the Purbeck Hills, with their peculiar strata, and, a little further on, the Portland Oolite. The soil is altogether calcareous, and for the most part a continuous mass of either white or a brownish limestone, the latter having a mixture of sea-shells. The quarries on the south side of the isle afford an inexhaustible fund of natural curiosities. The best quarries are at Kingston, Worth, Langton, and Swanage. The Swanage stone is white, full of shells, takes a polish, and looks like alabaster. All over the heaths, both here and on the mainland, blocks of indurated Tertiary grit, commonly called firestone, are found, and have been occasionally employed in the building of some of the neighbouring churches, and at Downshay and Qnar, in the parish of Worth, and elsewhere, the beautiful Purbeck marble, so conspicuous in the monuments and shafts of many of our cathedrals and finest churches of the 13th century, and now often sought for their restoration, has been extensively quarried. One of the most valuable products of Purbeck is a white clay used for making pipes, and very largely applied to the manufacture of china. Large quantities of it are dug, and many vessels loaded with it for Staffordshire in the port of Poole.

The Isle of Portland, as it is called, is also a peninsula, rising at its highest point, the Verne, to nearly 500 feet above the sea-level, and sloping gradually to near the water's edge at its extreme southerly point, the Bill. Its famous quarries, about 100 in number, are scattered in all directions under heaps of rubble and unsaleable stone. They are Crown-property, and, except where the stone is taken for Government purposes, are leased to various firms, who pay a royalty of so much per ton. Some 50,000 tons are annually raised and exported. The stratum of stone

that is worked for sale lies nearly parallel with the upper surface of the island, and without much earth or rubbish on it. The Portland stone (or freestone as it is sometimes called) is well known for its almost white colour, and as composing the materials of the most splendid erections in London, as well as in other parts of the British empire. The connection of Portland with the mainland occurs at some 10 or 11 miles' distance, at Abbotsbury, where a most remarkable beach of raised shingle, called the Chesil (Anglo-Saxon *Ceosol*) or Pebble Beach, touches the shore, being thus far separated from it by a narrow estuary, famous for its swannery, called the Fleet.

The entire length of the beach is from 16 to 18 miles, with an average height of about 40 feet, and a breadth of some 180 or 190 yards, the pebbles constantly decreasing in size from 1 to 3 inches in diameter at Portland, to the size of peas at its termination.

Agriculture throughout the county has made very important advances within the last few years,—steam-cultivation and improved implements having been largely introduced, and the growth of root-crops abundantly stimulated by the use of artificial manures. The precarious crops of flax and hemp for the supply of the rope and twine works of Bridport are less cultivated than formerly. On the larger farms in the Chalk district a peculiar custom prevails of under-letting the dairies at so much per cow, the farmer finding the stock and the food, and the dairyman disposing of the produce. The horned sheep of Dorsetshire, long celebrated, have now become established as a useful and lucrative breed. Professor Bell, in his *History of British Quadrupeds*, gives a figure of this, as the typical English sheep, of "a handsome, though somewhat old-fashioned breed, principally esteemed for its producing lambs earlier perhaps than any other in this country." "To the eye of him who seeks for beauty in harmony and proportion (he adds) this sheep is one of the handsomest in any part of England. The strong well-formed body and limbs, the clear white fleece, the finely-curved horns, and other points will to him constitute a more pleasing combination of character than is to be found in those breeds which have become more changed from the old stock by repeated transmission of peculiarities, which, however advantageous to the breeder, whether for the sake of the fleece or the flesh, cannot be considered as adding to the abstract beauty of the animal." There are still many fine flocks of this characteristic breed existing in the county, though many farmers prefer the Southdowns or Hampshires, as better adapted to their particular holdings. There is a small breed in Portland, which fattens too highly upon richer pastures, but the mutton of which is an especial dainty, weighing only about 8 lb a quarter.

The old hardy race of long-horned cattle, formerly common in the hilly districts, are fast disappearing, and Devons, short-horns, and Herefords are almost exclusively now bred. Great quantities of butter are sent to the London market. The skimmed-milk cheese is often much esteemed, though little of it is exported from the county.

Vast numbers of mackerel are taken near Abbotsbury, and along the shore from Portland to Bridport. The season for taking them is from the middle of March till midsummer, in nets or seines.

The manufactures of Dorsetshire are not extensive. The principal are those of flax and hemp in the neighbourhood of Bridport and Beaminster, and of pottery and tiles in the district near Poole. Net-making, or braiding as it is called, and also gloving, are carried on in some of the villages; but the manufactures of lace, and of thread-buttons, formerly flourishing at Blandford and elsewhere, may be said to be now entirely obsolete. At Sherborne these industries have been succeeded by extensive silk-mills.

Few, if any, parts of England possess a more abundant treasure of prehistoric remains, than are to be found throughout this county, though the march of agricultural progress inevitably tends to their obliteration. Vestiges of peaceful British occupation may constantly be traced on those portions of the Downs which are still uninclosed, whilst a series of magnificent hill-forts crown all the most prominent heights, and probably served as camps of refuge for the harassed tribes and their cattle in times of war and invasion. The grandest of these, called Maiden Castle, is supposed to be the Dunium of Ptolemy, the stronghold or Acropolis of the Durotriges, whose gigantic ramparts may be seen outlined against the sky between the Weymouth and Bridport roads, about two miles south from Dorchester. Its inner area covers about 44 acres, its outer area about 116, the difference being absorbed in its stupendous double, and sometimes triple, entrenchments, some 60 feet high, and extraordinarily steep. Other grand examples of these hill-fortresses may be seen at Eggardon and Pilsdon to the westward, at Chalbury and Flowers-barrow to the eastward, and at Rawlsbury, or Bulbarrow, Hod (inclosing an equilateral Roman camp), and Hameldun, overlooking the valley of the Stour, and at Badbury, Woodbury, &c., in the more central parts of the county. It has been conjectured with great probability that some of these last were among the *oppida* subdued in the expedition of Vespasian; and it is not unlikely that in that remarkable chain of *tumuli*, or barrows, which are visible along the crest of the Ridgeway, now tunnelled for the lines of railroad which connect Weymouth and Dorchester, may have been deposited the ashes of certain nameless heroes who fought the battles either of invasion or resistance. Such barrows are widely distributed elsewhere through the county, and when opened have usually been found to contain little more than burnt bones, corroded metal, and rude cinerary urns, with occasional marks of subsequent Roman interments. A few monoliths, cromlechs, and stone circles have also been recorded.

Of the period of Roman occupation many relics exist. The *Via Iceniana*, or Icknield Street, with various vicinal off-shoots, passes through the centre of the county, and connects its chief town Dorchester, or Durnovaria, with Old Sarum and Exeter. An indisputable though scanty fragment of the Roman wall of Dorchester still exists; and the avenues, called the walks, which surround the town appear to follow its ancient course, the trees being planted sometimes on the *agger* and sometimes in the *vallum*. A tessellated pavement, some 20 feet square, was exhumed in 1858 in the grounds of the county prison, and is preserved in its chapel, and various fragments of a similar character, as well as many coins of the later emperors, and other metallic and fictile antiquities, have been and still are not infrequently brought to light, wherever the ground is disturbed. Roman pavements have been found elsewhere,—one at Rampisham in 1799, one at Frampton of unusual size and beauty in 1794, and others at Weymouth, Sherborne, Dewlish, &c. The amphitheatre, near the Dorchester railway station, has been generally attributed to the time of Agricola, and constructed very probably for the amusement of the Roman soldiers by the enforced labour of their captives. It is more perfect than any other remaining in this country, and has been calculated to suffice for nearly 13,000 spectators. The Roman stations in Dorsetshire which antiquarians pretty nearly agree in identifying are *Landinis* or *Londin*. Dorchester; *Clavio*, Arisa, Charmouth; *Durnovaria*, in the neighbourhood; Weymouth, or a place in the immediate neighbourhood; *Morino*, Wareham, or Hamworthy; *Bois*, Gussage Cow-down; *Iberno*, Bere. Of mediæval castles no

able remains exist, except at Corfe and Sherborne, both of them brought to ruin in the great Civil War, but both retaining picturesque and highly interesting traces of their former magnificence.

The three principal churches of the county are the abbey-church of Sherborne, a rich specimen of Third Pointed architecture, restored in recent years at immense cost, and with admirable taste; Wimborne Minster, with its two stately towers of different periods and its massive Norman nave; and the noble but unfinished abbey-church of Milton, now also carefully restored, and presenting some rich examples of the Decorated period. Besides these, there are noticeable churches at Bere-Regis, Dorchester (St Peter's), and Fordington, Maiden-Newton, Piddletrenthide, Cerne, Beaumuster, Powerstock, &c.; but, generally speaking, the ecclesiastical buildings of the county, though not uninteresting, cannot boast of special grandeur or beauty.

At Milton abbey, originally founded by King Athelstan, and also at Forde-Abbey, handsome portions of the monastic buildings are incorporated in the modern mansions; and there are monastic remains of varying interest at Cerne, Abbotsbury, Bindon, and elsewhere. At Sherborne some of the conventual buildings are to be traced within the precincts of the flourishing grammar school.

The dialect of the county, perfectly distinguishable from those of Wiltshire and Somersetshire, yet bearing many common marks of its Saxon origin, has been admirably illustrated, both philologically and poetically, by a living author, the Rev. Wm. Barnes, whose poems in the vernacular have won the eulogium of several eminent critics, whilst their Doric simplicity and tenderness and truth is heartily appreciated by high and low in the county.

This county has afforded titles to various noble families, besides the dukes and earls of Dorset, duke of Portland to that of Bentinck, earl of Dorchester to that of Damer, Shaftesbury to that of Ashley-Cooper, Viscount Bridport to that of Hood, Baron Melcombe to Bubb-Dodington, whilst Blandford, Weymouth, Woodsford, Eacombe, &c., are swallowed in the higher titles of their noble possessors.

Amongst its more eminent natives may be reckoned Cardinal Morton, Archbishops Stafford and Wake, Bishops Sprat and Stillington, Matthew Prior, Sir George Summers, Sir James Thornhill, &c.

The county rates have been recently assessed on an annual income of £21,095,736.

A curious ancient *Survey* of the county was written by a Rev. Mr Coker, about the middle of the 17th century, and published from his MS in 1732. In 1774 a very valuable *County History* appeared, by the Rev. John Hatfield, in 2 vols. folio; a second edition in 4 vols. folio, in 1803, and a third, greatly improved, and brought down to the present date, also in 4 vols. folio, in 1874. No other county in England, perhaps, possesses so full and accurate a topographical and genealogical survey as this. The antiquities of the county have likewise been satisfactorily elucidated in various publications by Mr Sydenham, Mr C. Warne, F.S.A., Dr Wake Smart, and others. (C. W. B.)

DORSET, THOMAS SACKVILLE, LORD BUCKHURST, FIRST EARL OF (1536–1608), was born in at Buckhurst in the parish of Withyham in Sussex. His father, Sir Richard Sackville, the friend of Roger Ascham, was connected with the Boleyn family, and thus distantly with Queen Elizabeth, his mother was Winifrede, daughter of Sir John Bruges or Bridges, of London. In his fifteenth or sixteenth year he was entered at Hart Hall, Oxford, but it was at Cambridge that he completed his studies and took the degree of master of arts. On leaving the university, where he had already obtained the reputation of a poet, he proceeded to the Inner Temple, and though the statement made by some authorities that he became a barrister is not supported by the registers, his connection with the society was not without result. He had already at the age of nineteen married

Cicely, daughter of Sir John Baker of Sissinghurst in Kent, and in 1557 he entered public life as member of parliament for Westmoreland. In the following year he sat for East Grinstead in Sussex, and the record of his activity is still to be found in the Journals of the House of Commons. Queen Elizabeth, who had just come to the throne, was attracted by the handsome person, high culture, and evident ability of her young poet-kinsman, who was accordingly, to quote his own words, "selected to a continual private attendance upon her own person," which did not, however, prevent him from appearing again in the Parliament of 1563 as member for Aylesbury in Buckinghamshire. A visit to the Continent in 1565 was interrupted by an unexplained imprisonment at Rome, and terminated by the news of his father's death, which took place on 21st April 1566. On his return he was knighted in the queen's presence, and obtained the title of Lord Buckhurst, by which he continued to be known through the most of his life. Apartments were provided for him in the queen's palace at Shene, where his mother was in charge; but the simplicity of his mode of life is shown by the fact that, when in 1568 he had to entertain Odet de Coligni, Cardinal de Châtillon, at the queen's command, he failed to satisfy the luxurious desires of his guest, and thus fell under her majesty's displeasure. In 1571 he was sent to France to congratulate Charles IX. on his marriage with Elizabeth of Austria; in 1572 he was one of the peers who tried Thomas Howard, earl of Norfolk; and in 1586 he was employed to convey to Queen Mary of Scotland the sentence of death. A more difficult task was found for him in 1587; as ambassador to the Hague he was expected "to expostulate in favour of peace with a people who knew that their existence depended on war, to reconcile those to delay who felt that delay was death, and to heal animosities between men who were enemies from their cradles to their graves." With what fearlessness, fidelity, and sagacity he discharged his duty, has been told in detail by the historian of *The United Netherlands*, who asserts that there is not a single line in all the ambassador's correspondence which does not reflect honour on his name. But his expostulations with the queen on her parsimonious policy, and his independent conduct towards the royal favourite Leicester, procured him, on his return to England, instead of approbation and reward for his services, an order confining him to his house for nine or ten months in token of her majesty's displeasure. On the death of the earl, however, he was again received into favour; in 1588 he was presented with the Order of the Garter; in 1591 he was elected chancellor of the university of Oxford, his claims having been supported by a royal letter; and, in 1599, on the death of Lord Burghley, he succeeded to the office of Lord High Treasurer of England. In the following year he had to pronounce sentence as High Steward on the earl of Essex, who had been his rival for the chancellorship and his opponent in politics. The change of the dynasty which took place in 1603 left his position unimpaired; his office of Lord Treasurer was confirmed to him by King James, and on 13th of March 1604, he was created earl of Dorset. He died suddenly on April 19th 1608, while sitting at the council table in Whitehall, and left his earldom to his son Robert Sackville.

In the history of English literature Thomas Sackville occupies an honourable position. We no longer possess any of the "sonnets finely sanced" for which, in his student days, he was praised by Jasper Heywood, but we may still read the *Ferrex and Porrex* by which he takes rank as the first writer of genuine English tragedy, the *Induction to the Mirror of Magistrates*, and the *Complaint of Henry Duke of Buckingham*. The first was written with the assistance of Thomas Norton, during Sackville's connection with the Inner Temple, was acted before Queen Elizabeth in 1561,

appeared without the author's permission in 1565, and again in authorized editions in 1570-1 and 1590. The second is a stately allegorical poem of the kind so much in vogue in the reign of Elizabeth, with elaborate personifications of sorrow, death, old age, &c., intended to stand as preface to a series of poems descriptive of the tragic fates of famous men; and the *Complaint* was to form the first of the series. They all display a lively fancy, and no small command of pure and sonorous English, but hardly awaken any regret that the author soon laid aside the poet's for the diplomatist's pen.

See *Sackville's Works*, edited by Reginald W. Sackville-West, 1859; and Arber's Reprint of the *Induction*.

DORSET, CHARLES SACKVILLE, SIXTH EARL OF (1637-1706), eldest son of Richard Sackville, the fifth earl, and Frances Cranfield, eldest daughter of Lionel, earl of Middlesex, was born January 24, 1637, and succeeded his father in 1677. His youth, spent partly in London and partly in Italy, was filled with all the madcap and libertine excesses of the period; but, owing doubtless to the nobler qualities which he none the less displayed, the graceful scapegrace found more favour with the public than the rest of the dissolute crew. He was high-spirited, generous, and humane; as years passed on his character ripened and refined, and he who had been the worthy rival of Charles II. lived to be laughed at by Etherege for fidelity to his wife. Though present as a volunteer under the duke of York during the Dutch war in 1665, and afterwards sent on more than one mission to the court of France, he took comparatively an unimportant part in politics until the commencement of the troubles which ended in the Revolution of 1688. Deprived in 1667 of his office as lord-lieutenant of Sussex, for his refusal to comply with James II.'s arbitrary demands, he soon after became one of the active members of the opposition, and in 1688 assisted the flight of the Princess Anne. After James had left the country, Dorset was a member of the council for the preservation of the public peace; and on William's accession he was appointed lord chamberlain. In 1691 he accompanied the new king to Holland; and, though he was afterwards involved in the accusations of infidelity brought forward by Preston, he retained and deserved the royal favour to the last. He died at Bath in January 1705-6, and was succeeded in the earldom by Lionel Cranfield Sackville, his only son by his second wife, Mary, daughter of James Compton, earl of Essex. Dorset keeps his place in the list of English poets in virtue of a few lyrical and satirical pieces, which, though extravagantly praised by his contemporaries, and, even according to Macaulay, displaying the easy vigour of Sackling and wit as splendid as that of Butler, are after all of no great moment in themselves, and only suggestive of what in happier circumstances the writer might have done. The best known is a pleasant careless song—*To all you Ladies now at Land*—written at sea shortly before the engagement with the Dutch, in which Admiral Opdam's ship was blown up. As a patron of literature, however, Dorset stands unrivalled,—judicious, impartial, and munificent. To him Prior was indebted for his education. Montague for promotion, and Wycherly for support against the disfavour of the public. Though compelled as lord chamberlain to deprive Dryden of his official laurel, he took care to make good from his private purse the pecuniary loss involved in the dismissal.

See Prior's dedication of his poems to the duke of Dorset; Johnson's *Lives of the Poets*; Walpole's *Recess and Noble Authors*; Macaulay's *History of England*, vol. iii. chap. viii.

DORT, or DORDECHT, an important commercial city of Holland, at the head of a district in the province of South Holland, 10 miles S.E. of Rotterdam, on the railway between that city and Breda. The island of the Meuse or Merwe on which it stands is said to have been separated

from the mainland in 1421, by an inundation which swept away 72 villages, and about 100,000 inhabitants. Concerning its origin there is no authentic information, but it is certainly one of the oldest cities of Holland, and probably dates from the 10th century. It was surrounded by walls in 1231 by Florent IV., count of Holland, who made it his residence, and granted it many important privileges. In 1457, almost the entire town, including the church of Notre Dame, founded in 1366, and other public buildings, was destroyed by fire. One of the first towns in the Netherlands to embrace the Reformed religion, and to throw off the yoke of the Spanish king, it was chosen in 1572 as the meeting-place of the deputies by whom the independence of the United Provinces was first asserted; and in 1618 and 1619 it became intimately associated with the theological history of Europe, as the seat of the great synod which declared against the Arminian party. Among its celebrities are the De Witts and Ary Scheffer the artist. The town hall is a handsome building, and the principal church is an old Gothic structure 300 feet long by 125 wide, with a heavy square tower, and numerous monumental stones, some of great antiquity. The hall in which the synod was held is now demolished. The houses are generally of an antique fashion, with the gables turned outwards, and many of them date from the period of the Spanish occupation. Dort possesses a good harbour, from which two canals lead to the centre of the town. It carries on an extensive trade in corn, flax, salt fish, train oil, and the amber which is brought down the Rhine; and it has shipbuilding docks, saw-mills, sugar-refineries, tobacco-factories, linen-bleacheries, salt-works, and white-lead works. Population in 1850, 20,878, and in 1874, 25,777.

DORT, SYNOD OF, an assembly of the Reformed Dutch Church, with deputies from France, Switzerland, the Palatinate, Scotland, and England, called to decide the theological differences existing between the Arminians (or Remonstrants) and the Calvinists (or Counter Remonstrants), was held at Dort or Dordrecht in the years 1618 and 1619. During the life of Arminius a bitter controversy had sprung up between his followers and the strict Calvinists, led by Francis Gomar, his professorial colleague at Leyden; and, in order to decide their disputes, a synodical conference was proposed, but Arminius died before it could be held. At the conference held at the Hague in 1610, the Arminians addressed a remonstrance to the States-general in the form of five articles, which henceforth came to be known as the five points of Arminianism. This conference had no influence in reconciling the opposing parties, and another, held at Delft in the year 1613, was equally unsuccessful. In 1614, at the instance of the Arminian party, an edict was passed by the States-general, in which toleration of the opinions of both parties was declared, and further controversy forbidden; but this act only served, by rousing the jealousy of the Calvinists, to fan the controversial flame into greater fury. Gradually the dispute pervaded all classes of society, and in nearly all the towns both parties began to hold large meetings, and to indulge in threatening words and gestures, until finally, in Nov. 1617, Prince Maurice of Orange, in order finally to decide the controversy, called a synod which met at Dort in Nov. 1618. This synod was strictly national—called by the national authority to decide a national dispute, and not intended to have more than a national influence. The foreign deputies were invited to attend, only to assist by their advice in the settlement of a controversy which concerned the Netherlands church alone, and which the Netherlands church alone could decide. At the fourth sitting it was decided to cite Simon Episcopius and twelve other Remonstrants to appear within 14 days before the synod,

to state and justify their doctrines. It was also agreed to allow the Arminian deputies to take part in the deliberations, only on condition that they forbore to consult with, or in any way assist, their cited brethren, but this they refused. During the interval between the citation and the appearance of the accused, the professorial members of the synod were instructed to prepare themselves to be able to confute the Arminian errors, and the synod occupied itself with deliberations as to a new translation of the Bible, for which a commission was named, made arrangements regarding the teaching of catechisms, and granted permission to the missionaries of the East Indies to baptize such children of heathen parents as were admitted into their families. At the 25th sitting Episcopius and the others cited appeared, when Episcopius surprised the deputies by a bold and outspoken defence of his views, and even went so far as to say that the synod, by excluding the Arminian deputies, could now only be regarded as a schismatic assembly. The Remonstrants were asked to file copious explanations of the five points in dispute, but objecting to the manner in which they were catechized, they were, at the 57th sitting, dismissed from the synod as convicted "liars and deceivers." The synod then proceeded in their absence to judge them from their published writings, and came to the conclusion that as ecclesiastical rebels and trespassers they should be deprived of all their offices. The synodical decision in regard to the five points, and the sentence against the Remonstrants was, at the 144th sitting, read in Latin before a large audience in the great church. The Remonstrants were required to subscribe the condemnation, and many of them refusing were banished. The synod was concluded on 29th April 1619, by a magnificent banquet given by the chief magistrate of Dort.

DORTMUND, a town of Germany, capital of a circle of the same name, in the district of Arnsberg, and Prussian province of Westphalia, is situated on the Emscher, in 51° 31' 25" N. lat and 7° 27' 9" E. long. Among the chief structures may be mentioned the large railway station, the workshop and factories of which give employment to upwards of 1000 hands, the Reinoldikirche, with a choir built in 1421–1450, the old Marienkirche, and the Gothic Dominican church. To the W. of the station is one of the ancient linden trees of the Königshof, where the meetings of the supreme court of the formidable Vehmgericht, or secret tribunal of the Middle Ages, were held. In the vicinity of Dortmund are collieries, in the working of which several thousands of persons are engaged. Since the discovery of iron-ore in the coal district, in 1850, many forges and blast-furnaces have been erected. The manufactures include tobacco, iron and steel, machinery, porcelain, earthenware, oil and flour, and woollen, linen, and cotton fabrics. In 1875 the town had 47 breweries, which furnished more than 6½ millions of gallons of beer. The population in 1875 was 57,742.

Dortmund, the Throtmanni, Trutmannia, Trutmonia, Tremonia, and Tromunde of early history, was already a town of some importance in the year 800. In 1095 it was the scene of an ecclesiastical council, and in 1016 and 1180 of imperial diets. The town was walled in the 12th century, and in 1357–88 successfully withstood the troops of the archbishop of Cologne, who besieged it for 21 months. About the middle of the 13th century it joined the Hanseatic League. At the close of the Thirty Years' War the population had become reduced to 3000. In 1803 Dortmund lost its rights as a free town, and was annexed to Nassau. The French occupied it in 1806, and in 1808 it was made over by Napoleon to the grand duke of Berg, and became the chief town of the department of Ruhr. Through the cession of Westphalia by the king of the Netherlands, May 31, 1815, it became a Prussian town.

DORY, or **JOHN DORY** (*Zeus faber*), an Acanthopterygian fish belonging to the family *Scombridae*, held in such esteem by the ancient Greeks that they called it Zeus after their principal divinity. Its English name is probably a corrupt

tion of the French *jaune dorée*, and has reference to the prevailing golden-yellow colour of the living fish. The body in the dory is much compressed, and is nearly oval in form, while the mouth is large and capable of extensive protrusion. It possesses two dorsal fins, of which the anterior is armed with long slender spines, and the connecting membrane is produced into long tendril-like filaments, while a row of short spines extends along the belly and the roots of the anal and dorsal fins. The colour of the upper surface is olive brown, the sides are yellowish, and are marked with a prominent dark spot, on account of which the dory divides with the haddock the reputation of being the fish from which Peter took the tribute money. It is an inhabitant of the Atlantic coasts of Europe, the Mediterranean, and the Australian seas. It is occasionally abundant on the coasts of Devon and Cornwall, and is also found, though more sparingly, throughout the British seas. It is exceedingly voracious, feeding on mollusks, shrimps, and the young of other fish, and Conch states that from the stomach of a single dory he has taken 25 flounders, some 2½ inches long, 3 fatherlashers half grown, and 5 stones from the beach, one an inch and a half in length. They are often taken in the fishermen's nets off the Cornwall and Devon coast, having entered these in pursuit of pilchards. They are seldom found in deep water, preferring sandy bays, among the weeds growing on the bottom of which they lie in wait for their prey, and in securing this they are greatly assisted by their great width of gape, by their power of protruding the mouth, and by the slender filaments of the first dorsal fins, which float like worms in the water, while the greater part of the body is buried in the sand, and thus they entice the smaller fishes to come within easy reach of the capacious jaws. The dory often attains a weight of 12 lb, although those usually brought into the market do not average more than 6 or 7 lb. It is highly valued as an article of food.

DOTIS. See TOTIS.

DOUAI, or DOUAY, an ancient and once strongly-fortified town of France, at the head of an arrondissement, in the department of Nord, situated on the Scarpe, at a railway junction 18 miles S of Lille. Its triple line of fortifications, partly the work of Vanban and partly of more modern structure, includes a considerably larger space than is requisite for the area of its buildings; the streets are consequently spacious, and the number and size of the gardens unusually large. Besides a variety of administrative offices, the town possesses a court of appeal, which holds its sessions in the palace of the ancient parlement of Flandres, it contains also one of the principal cannon foundries of the kingdom, an arsenal, and large artillery establishments, and is further remarkable for the number of its literary and scientific institutions, among which may be mentioned the academy, with its faculties of letters and law, representing the university established in 1562, the college, founded by cardinal Allen, for the education of English Roman Catholic priests, the Government school of artillery, a school of drawing and music, a museum of natural history and antiquities, enriched with sculptured stones and inscriptions from Beval, a botanical garden, a collection of paintings, and a public library of upwards of 40,000 volumes, and among the rest about 300 incunabula. The church of Notre Dame dates from the 12th and 14th centuries, and preserves a remarkable painting, containing 254 figures, which formerly belonged to the abbey of Aachen, and was apparently the work of Jean Bellegambe; the ancient Carthusian convent is still extant as an artillery magazine; and the town-house ranks as one of the historical monuments of France, and is architecturally interesting for its ogival windows and its belfry and spire. Railways and canals open up to Douai an extensive trade in corn,

wine, brandy, cattle, wool, flax, and other agricultural products; and it manufactures lace, gauze, cottons, linens, thread, earthenware, soap, salt, and beer. The origin of the town is a matter of dispute; but it rose into importance in the Middle Ages under the Counts of Flanders, passed afterwards into the possession of the dukes of Burgundy, and thus became subject to the Spanish crown. In 1667 it was captured by the French under Louis XIV.; and though the allies under Marlborough and Eugene obtained possession in 1710, it was retaken by the French in 1711, and finally incorporated with France in 1714. Population in 1872, 21,703.

DOUARNENEZ, a town and watering-place of France, in the department of Finistère, to the S. of a bay of the same name. Its sardine fishery, which is carried on from the end of June to the beginning of December, gives occupation to about 800 boats, and between 3000 and 4000 men; the average number of sardines caught each year is 360,000,000, worth 9,000,000 francs. Population, 7180 in 1872.

DOUBLEDAY, THOMAS, an English author in political and general literature. He early adopted the views of his friend William Cobbett, and was active in promoting the agitation which resulted in the passing of the Reform Act of 1832. As secretary of the Northern Political Union of Whigs and Radicals, he took a prominent part in forwarding the interests of Lord Grey and the reforming party. In 1858-59 he was a member of the council of the Northern Reform Union; and to the last he was a keen observer of political events. He succeeded his father as partner in an eminent firm of soap manufacturers at Newcastle, but devoted his attention rather to literature than to mercantile affairs. On the failure of the firm he obtained the registrarship of St Andrew's parish, Newcastle, a post which he held until appointed secretary to the coal trade. He died at Burham, near Newcastle, December 18, 1870.

Besides poems, dramas, numerous pamphlets, contributions to *Blackwood's Magazine*, the *Eclectic Review*, and other periodicals, and leading articles in the *Manchester Guardian* and the *Newcastle Chronicle*, Doubleday wrote *A Financial, Monetary, and Statistical History of England*, 1847; *A Treatise on Mundane Moral Government*, 1852; *The True Law of Population*, 1853, a romance, *The Eve of St Mark*, 1857; *The Political Life of Sir Robert Peel*, 1859, and *Matter for Materialists*, 1870.

DOUBS, an eastern frontier department of France, so named from its chief river, is formed of the ancient German principality of Montbéliard (Mompelgard), and of part of the province of Franche-Comté. It is bounded N.E. by Switzerland, N. by the territory of Belfort and by Haute-Saône, and N.W. and S.W. by Haute-Saône and Jura; and lies between 46° 33' 10" and 47° 33' 45" N. lat., and 5° 42' and 7° E. long. The surface is chiefly mountainous, four parallel chains of the Jura crossing it from S.W. to N.E. In the loftiest and most easterly chain the principal summit, Mont d'Or, has an altitude of 4800 feet; in the most westerly the highest points do not exceed 1000 feet. The river Doubs rises at the foot of the Noir Mont, in the arrondissement of Pontarlier, and, after twice traversing the department, passes through Jura, enters Saône-et-Loire, and joins the Saône at Verdun, after a course of 267 miles. It is navigable from Voujaucourt, near Montbéliard, to its mouth. Near Morteau it forms a cataract 88 feet in height. From Voujaucourt to Dôle it constitutes a part of the navigable canal between the Rhone and Rhine. Doubs is well watered by smaller rivers and rivulets. The climate, owing to the differences of elevation, is variable, but it is generally cold and rainy, and the winters are severe. The soil is stony and loamy, and at the higher levels there are numerous peat-bogs. The department may be divided into three regions. The highest, on which the snow usually lies

from six to eight months in the year, is in part barren, but on its less exposed slopes is occupied by forests of fir trees, and affords good pasturage for cattle. In the second or lower region the oak, beech, walnut, and sycamore flourish; and the valleys are susceptible of cultivation. The region of the plains is the most fertile, and produces wheat, rye, maize, hemp, pulse, and grapes and other fruits. Agriculture is in a backward state, but cattle-rearing and dairy-farming receive much attention. Gruyère cheese to the value of seven millions of francs is produced yearly. The most important manufactures are watches, of which about 300,000 are annually made, cotton and woollen cloths, hardware, cutlery, paper, glass, and leather. There are several iron foundries, and distilleries for brandy and absinthe; and the trade in cattle, ludes, and timber is considerable. Among the mineral products are iron, coal, lignite, marble, building stone, gypsum, glass-sand, and grindstones. Doubs is divided into the arrondissements of Besançon, Pontarlier, Baume-les-Dames, and Montbéliard, comprising 27 cantons and 639 communes. The capital is Besançon. Of the total area of 522,755 hectares (1,291,200 acres), about 462,353 acres are arable, 299,329 under wood, 19,848 vineyard, 215,684 meadows, and 225,294 heath. The population in 1872 was 291,251.

DOUCE, FRANCIS (1762–1834), an English antiquarian, born in 1762, was the son of one of the six clerks of Chancery. After completing his education he entered his father's office, but quitted it after a short time, and devoted himself to the collection and study of antiquities. He became a prominent member of the Society of Antiquaries, and maintained an active correspondence with most of the leading antiquaries of his day. For a time he held the post of keeper of manuscripts in the British Museum, but he was compelled to resign it owing to a quarrel with one of the trustees. In 1807 he published his *Illustrations of Shakespeare and Ancient Manners* (2 vols. 8vo), which contained some curious information, along with a great deal of trifling criticism and mistaken interpretation. An unfavourable notice of the work in the *Edinburgh Review* greatly irritated the author, and made him unwilling to venture any further publications. He contributed, however, a considerable number of papers to the *Archæologia* and the *Gentlemen's Magazine*. In 1833 he published a *Dissertation on the various Designs of the Dance of Death*, the substance of which had appeared forty years before. He died on the 30th March 1834. By his will he left his printed books, illuminated manuscripts, coins, &c., to the Bodleian Library; his own manuscript works to the British Museum, with directions that they should not be opened until 1900; and his paintings, carvings, and miscellaneous antiquities to Sir Samuel Meyrick, who published an account of them, entitled *The Doucean Museum*.

DOUGLAS, the commercial capital of the Isle of Man, and a favourite watering-place, stands on a fine semicircular bay on the east coast of the island, at the junction of the Dhoo and Glass, in 54° 10' N. lat. and 4° 26' W. long. The older streets, as is usual with seaport towns, are irregular and narrow, but the modern ones, on terraces rising beyond the old town, are handsome and spacious. Among the public buildings may be noticed Castle Mona (now converted into a hotel), the "tower of refuge," on a dangerous point in the bay, the court-house, the house of industry, the anti-hospital, and the theatre, which has accommodated 1000 persons. The ancient parish church of Bradda, partially rebuilt in 1773, has been replaced by a more modern building. There are four chapels and distinct churches—St Matthew's, St George's, St Barnabas's, and St Thomas's, and the Roman Catholics, Wesleyan and Primitive Methodists, Congregationalists, and Scotch Presbyterians have also places of worship. The salubrity of

the climate, the peculiar characteristics of the surrounding scenery, and the cheapness of living render Douglas a favourite resort. There is communication daily in summer with Liverpool, Fleetwood, and Barrow, twice or thrice weekly with Ireland, and occasionally with Glasgow. The harbour is dry at low water; but vessels drawing not more than 10 feet may enter during neap tides, and those drawing not more than 14 feet during spring tides. A splendid new pier, at which passengers can land and embark at all heights of tide, was erected in 1872, and a spacious promenade, inclosing the greater part of the shore, in 1876. The principal industries are the coasting trade and fisheries. Population in 1871, 13,846.

DOUGLAS, GAVAIN or GAVIN (c. 1474–1522), bishop of Dunkeld, and the ancient classical poet of Scotland, was the third son of Archibald, earl of Angus, known in Scottish history as "Bell-the-Cat." His mother was Elizabeth, daughter of Robert Lord Boyd, high chamberlain of Scotland. The year when he was born has not been recorded, but it is almost certain that it was 1474, or the beginning of 1475; and of his father's sons the one most likely to have been his birthplace was Douglas Castle, Lanarkshire.¹ Being intended for the church, Douglas studied at the university of St Andrews, where his name appears in the lists of alumni between 1489 and 1494. Having entered into holy orders, he was shortly afterwards appointed rector of Hauch, or Prestonkirk, and parson of Linton in East Lothian.² In 1501 he was elected dean or provost of the collegiate church of St Giles's, Edinburgh, an office of dignity and emolument.

In the battle of Flodden (1513), when James IV. and many of the Scottish nobility and ecclesiastics were killed, the earl of Angus lost his two eldest sons, which so affected him that he retired to St Mains, a religious house in Galloway, where he soon after died. He was succeeded by his grandson, Archibald, a handsome young nobleman, who attracted the attention of the widowed Queen Margaret, sister of Henry VIII. of England, and they were married within eleven months after the death of the king. While this precipitate connection incensed the nobility and caused much jealousy of the Douglas family, it seemed to open up a way for the preferment of Gavin Douglas. By the influence of the queen, Douglas was "postulated" by the Pope to the abbacy of Aberbrothock, or Arbroath. He met with such opposition, however, from a rival claimant, that his appointment was never completed, and he was unable to obtain his abbacy. Douglas was next recommended by the queen to the Pope for the archbishopric of St Andrews, then vacant, and, relying upon the validity of this appointment, he attempted by force to obtain possession of the castle of St Andrews. He was, however, unsuccessful, and ultimately was passed over in favour of Andrew Forman. At length, by the united influence of the queen and the Pope, he was nominated for the bishopric of Dunkeld, which shortly afterwards became vacant. The people were so indignant at the marriage of the queen with Angus that the Parliament deprived her of the regency of the kingdom and the charge of the young King James V., and appointed the duke of Albany to be regent in her room. One of the first acts of the duke, who came from France to assume the reins of government, was to bring Douglas to trial for intriguing for ecclesiastical benefices with the queen and the pope without the sanc-

¹ Brechin has been stated as the birth-place of Douglas by Mr D Black in his history of that town (2d ed. p. 287), but no authority for this is quoted.

² The authority for the former designation is Myln's MS. *Vita Episcopi Dunkeldi*, by misreading which Douglas is by Bishop Sage called rector of Herriot, and by Dr Irving and others, rector of Hawick. His latter designation is found in the MS of his *Translation of Virgil* preserved in Trinity College, Cambridge — *Works*, i. p. 173.

tion of Parliament. He was found guilty, and put in prison in what he calls the "wyndy and richt vnpleasent eastell and royk of Ediuburgh," where he continued for about a year. This harsh step of the duke of Albany seems to have brought about a feeling of sympathy for Douglas. He was at length set at liberty, and, to make some amends, the duke permitted him to be consecrated bishop of Dunkeld.

The marriage of the queen with the earl of Angus proved an unhappy one; and, in consequence of his ill-treatment of her, the queen separated from her husband and joined with the regent against the Douglasses. Angus fled to the borders for a time; and in 1521 his uncle Gavin was deprived of his bishopric. The bishop then took shelter at the court of Henry VIII, but in 1522 he died of the plague at London, in the forty-eighth year of his age. His remains were interred in the Hospital Church of the Savoy.

The works of Bishop Douglas, though not numerous, are important. They consist of—(1) *The Palace of Honour*, a poem written in 1501,—an allegorical description of many gorgeous cavalcades of famous persons trooping to a magnificent palace somewhat like Chaucer's Temple of Fame, in the execution of which Douglas has displayed much originality of treatment; (2) Another allegorical poem called *King Hart*, or the heart of man, descriptive of the progress of life from youth to age; (3) A short poem called *Conscience*, and (4) A *Translation of the Æneid of Virgil*, with the supplemental book of Maphæus Vegius. To each book a short prologue is prefixed, of which the one before the 12th,

"Where splendid Douglas paints the blooming May," is perhaps the finest effort of his muse.

This *Translation of Virgil*, by which Douglas is best known, is a work of which Scotland will always be proud, as it was the first metrical translation of a classical author made in Britain, and the precursor of many others. Although it is very diffuse, from the difficulty its author had in adapting the Doric language of his country to the purposes of translation, by the same reason it is a work of considerable philological value in tracing the history of the literary language of Scotland. Although Douglas was the first native writer who applied the name "Scottis" to the language he employed, he has Scotticized many Latin words, and imported many expressions from the French; while his admiration of Chaucer has induced him to avail himself of some of the grammatical forms used by that poet. Still, his translation, written in the broad and widely spread dialect common at an early period to the north of England and Scotland, will always form one of the most important landmarks in Scottish philology. In concluding it Douglas unfortunately took farewell of poetical composition, and entered the arena of political strife, as the following extract shows—

"Thus vp my pen and instrumentis full yore
On Virgillis post I fix for evirmore.
Nenir from thenis syk matteris to discreue,
My muse sall now be elene contemplatiue
And solitar as doith the byrd in cage.
Sen fer byworn is all my chyldis age,
And of my dayis nere passit the half date
That nature suld me grantyn, vele I wate,
Thus, sen I fell down sweyand the ballance,
Here I resigne vp younkers obseruance,
And wyl direk my labouris euermoir
Vnto the commoun welth and Goddis glour."¹

Several early MSS of Douglas's *Translation of Virgil* exist. One is preserved in the library of Trinity College, Cambridge, copied by his amanuensis, Matthew Geddes, from the bishop's own papers. Two are in the library of the university of Edinburgh, and one in that of the marquis of Bath at Longleat. Of the

¹ Works, vol iv p 233. The last two lines occur in the B. L. ed. of 1553.

printed editions one was issued by William Copland at London in 1553, one was printed by Ruddiman at Edinburgh in 1711, and one was presented to the members of the Bannatyne Club in 1839. *The Palace of Honour* was first printed at London by William Copland, without date, but probably in 1553; and an edition, printed by "John Ros for Henrie Charters," appeared at Edinburgh in 1579, of which only two copies are known to exist. This rare edition was reprinted for the Bannatyne Club. The poems called *King Hart* and *Conscience* exist in the Maitland MS in the Pepysian Library, Cambridge. The works of the bishop were first collected and published at Edinburgh in 1874, under the editorship of Mr John Stirling, with a life prefixed, and a glossary appended. (J SM)

DOUGLAS, STEPHEN ARNOLD (1813-1861), an American statesman, was born at Brandon, in the State of Vermont, on the 23d April 1813. His father, a physician, died when he was still an infant, and in his youth he had to struggle with poverty. He was apprenticed to a cabinet-maker, but his health failed, and he quitted the employment after a year and a half. He next studied for three years at the academy of Canandaigua, giving special attention in the latter part of his course to law. In 1833 he went west to seek his fortune, and settled in Jacksonville, Illinois. Here he supported himself for a few months by acting as an auctioneer's clerk and keeping a school. Called to the bar in March 1834, he quickly obtained a large and lucrative practice, and so early as the following year was elected attorney-general of the State. In December 1835 he was elected a member of the legislature, in 1837 he was appointed registrar of the land office at Springfield, and in December 1840 he became secretary of state of Illinois. He was a judge of the supreme court of Illinois from 1841 till November 1843, when he resigned the office in order to stand a candidate for Congress in the Democratic interest. In 1837 he had failed to secure his return by a minority of 5 in a total vote of 36,000; on this occasion he was successful, being elected by a majority of 400. He took an active share in the Oregon controversy, asserting his unalterable determination not to "yield up one inch" of the Territory to Great Britain, and advocating its occupation by a military force. He was also a leading promoter of the measures which resulted in the annexation of Texas and in the Mexican war. Being chairman of the Territorial committee at first in Congress and then in the Senate, to which he was elected in March 1847, it fell to him to introduce the bills for admitting Iowa, Wisconsin, Minnesota, California, and Oregon into the Union, and for organizing the Territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas, and Nebraska. On the keenly disputed question of the permission of slavery in the Territories, Douglas advocated, if he was not the first to promulgate, what came to be known as the "popular sovereignty doctrine," by which each territory was to be left to decide the matter for itself in the same manner as a State. The bill for organizing the Territories of Kansas and Nebraska, which Douglas reported in January 1854, caused great popular excitement, as it repealed the Missouri compromise, and declared the people of "any State or Territory" "free to form and regulate their domestic institutions in their own way, subject only to the constitution of the United States." There was great indignation throughout the free states; and Douglas, as the chief promoter of the measure, was hanged or burned in effigy in many places. In 1852, and again in 1856, he was a candidate for the presidency in the National Democratic Convention, and though on both occasions he was unsuccessful, he received strong support. In 1857 he distinguished himself by his vigorous opposition to the admission of Kansas into the Union under the Lecompton constitution, which he maintained to be fraudulent. In the following year he was engaged in a close and very exciting contest for the senatorship with Abraham Lincoln, who was the Republican candidate. The

popular vote was against him, but in the legislative vote he secured his return by 54 to 46. Douglas paid great attention to the local affairs of Illinois, and he was the chief promoter of the Illinois Central Railroad. In 1860 he was again one of the Democratic candidates for the presidency, and received a large popular vote, but he was very feebly supported in the electoral college. On the outbreak of the civil war he denounced secession as criminal, and was one of the strongest advocates of maintaining the integrity of the Union at all hazards. He delivered frequent addresses in this sense after the adjournment of Congress, and during his last illness he dictated a letter for publication urging all patriotic men to sustain the Union and the constitution. He died at Chicago on the 3d June 1861.

DOUR, a town of Belgium, in the province of Hainault, nine miles south-west of Mous, to the right of the railway from that city to Valenciennes. It owes its whole importance to its manufacturing industry, which includes iron-smelting, weaving, bleaching, and tanning, and is fostered by the existence in the vicinity of coal and iron mines. Population in 1866, 8501.

DOUSA, JANUS [JAN VAN DER DOES] (1545–1604), a distinguished Dutch statesman, historian, poet, and philologist, the heroic defender of Leyden, was born at Noordwyck, in the province of Holland, December 6, 1545. Left an orphan at the age of five, he was brought up by his grandfather, after whose death an uncle took charge of him. He began his studies at Lier in Brabant, became a pupil of Henry Junius at Delft in 1569, and thence passed successively to Louvain, Douai, and Paris. Here he studied Greek under Peter Dorat, professor at the Collège Royal, and became acquainted with the Chancellor L'Hopital, Turnebus, Ronsard, and other eminent men. On his return to Holland in 1565 he married. His name stands in the list of nobles who in that year formed a league against Philip II, but he does not appear to have taken any active part in public affairs till 1572, when he was sent as head of an embassy to England. Two years later he was intrusted with the government and defence of Leyden, then besieged by the Spaniards; and in this arduous post he displayed rare intelligence, fortitude, and practical wisdom. On the foundation of the university of Leyden by William I of Orange, Dousa was appointed first curator, and this office he held for nearly thirty years. Through his friendships with foreign scholars he drew to Leyden many illustrious teachers and professors. After the assassination of William I in 1584, Dousa came privately to England to seek the aid of Queen Elizabeth, and in the following year he was sent formally for the same purpose. About the same time he was appointed keeper of the Dutch archives, and the opportunities thus afforded him of literary and historical research he turned to good account. In 1591, being named a member of the States-General, he removed to the Hague. Heavy blows fell upon him in the deaths of his eldest son in 1597 and of his second son three years later. A bitterer trial still was the misconduct of another son. Dousa was author of several volumes of Latin verse and of philological notes on Horace, Catullus, Tibullus, Petronius Arbiter, and Plautus. But his principal work is the *Annals of Holland*, which first appeared in a metrical form in 1599, and was published in prose, under the title of *Bataviae Hollandique Annales*, in 1601. This work had been begun by his eldest son. Dousa also took part, as editor or contributor, in various other publications. He died at Noordwyck, October 8, 1604, and was interred at the Hague, but no monument was erected to his memory until 1792, when one of his descendants placed a tomb in his honour in the church of Noordwyck.

DOUVILLE, JEAN BAPTISTE (1794–c. 1837), a French traveller born at Hambye, in the department of Manche, whose asserted discoveries in Africa have in large measure been relegated to the region of romance. At an early period his imagination seems to have been fired by narratives of travel and adventure, and accordingly, when he fell heir to a wealthy relation, he at once proceeded to gratify his desire for personal acquaintance with foreign lands. He certainly wandered far and wide; and, according to his own profession, he visited India, Kashmir, Khorassan, Persia, Asia Minor, and many parts of Europe. After spending some time in Paris, and being admitted a member of the Société de Géographie, he proceeded in 1826 to Brazil, with the intention apparently of carrying on scientific explorations: from this purpose, however, he was diverted by the political circumstances of the country; and to replenish his funds he started business at Montevideo in partnership with a M. Laboussière. Towards the close of the following year, probably in October, after a short residence at Rio Janeiro, he left Brazil for the Portuguese possessions on the west coast of Africa, where his presence in March 1828 is proved by the mention made of him in certain letters of Castillo Branco, the governor-general of Loanda. In May 1831 he reappeared in France, claiming to have pushed his explorations into the very heart of Africa, as far as the 27th degree of longitude E. of Greenwich, or, in other words, into what is now known as the great equatorial lake region. His story was readily accepted by the Société de Géographie at Paris, which hastened to recognize his services by assigning him the great gold medal, and appointing him their secretary for the year 1832. On the publication of his narrative—*Voyage au Congo et dans l'intérieur de l'Afrique équatoriale*—which occupied four large volumes, and was accompanied by an elaborate atlas, the public enthusiasm might well run high. In company with his wife (a sister of his old Montevideo partner), and attended by about 400 native porters, the happy traveller had advanced from kingdom to kingdom rather like a monarch making a progress through his tributary states, distributing largesses and receiving homage, than like a humble adventurer defraying his expenses from his private purse. Everything went smooth for a time; the interior of Africa was described in text books and depicted in maps according to the discoveries of Douville; but in the August number of the *Foreign Quarterly Review* for 1832 the most sweeping charges of ignorance and fraud were launched against the author, and this attack was followed up in the *Revue des Deux Mondes* for November, by Thomas Lacordaire, who asserted that, during part of the time which he claimed to have spent in Africa, Douville had been a familiar object in the streets of Rio Janeiro. The tide of popular favour turned, and, in spite of the explanations furnished by Douville in *Ma défense*, 1832, and *Trente mois de ma vie, ou quinze mois avant et quinze mois après mon voyage au Congo*, 1833, the general decision was openly against him. Mlle. Audran, a lady to whom he was about to be married, committed suicide from grief at the disgrace, and, after vainly attempting to obtain satisfaction from Lacordaire by duel, the poor adventurer himself withdrew in 1833 to Brazil, and proceeded to make explorations in the valley of the Amazon. According to Dr Gardner, in his *Travels in the Interior of Brazil*, he was murdered in 1837 on the banks of the São Francisco for charging too high for his medical assistance. His Brazilian manuscripts fell into the hands of M. S. Raug, by whom they were transmitted to M. Ferdinand Denis. While modern exploration has done nothing to support the wider pretensions of Douville, no less an authority than Captain Burton asserts that his descriptions of the country of the Congo are life-like and

pictnresque; that his observations on the anthropology, ceremonies, customs, and maladies of the people are remarkably accurate, and that even the native words inserted into the text of his narrative "are for the most part given with unusual correctness."

DOUW, or DOW, GERHARD (1613-1680), a celebrated Flemish painter, was born at Leyden on the 7th April 1613. His first instructor in drawing and design was Bartholomew Dolendo, an engraver, and he afterwards learned the art of glass-painting under Peter Kouwboorn. At the age of fifteen he became a pupil of Rembrandt, with whom he continued for three years. From the great master of the Flemish school he acquired his skill in colouring, and in the more subtle effects of chiaroscuro; and the style of Rembrandt is reflected in several of his earlier pictures, notably in a portrait of himself at the age of twenty-two, in the Bridgewater Gallery, and in the Blind Tobit going to meet his Son, at Waddon Castle. At a comparatively early point in his career, however, he had formed a manner of his own distinct from, and indeed in some respects antagonistic to, that of his master. Gifted with unusual clearness of vision and precision of manipulation, he cultivated a minute and elaborate style of treatment, and probably few painters ever spent more time and pains on all the details of their pictures down to the most trivial. He is said to have spent five days in painting a hand, and his work was so fine that he found it necessary to manufacture his own brushes. Notwithstanding the minuteness of his touch, however, the general effect was harmonious and free from stiffness, and his colour was always admirably fresh and transparent. He was fond of representing subjects in lantern or candle light, the effects of which he reproduced with a fidelity and skill which no other master has equalled. He frequently painted by the aid of a concave mirror, and to obtain exactness looked at his subject through a frame crossed with squares of silk thread. His practice as a portrait painter, which was at first considerable, gradually declined, sitters being unwilling to give him the time that he deemed necessary. His pictures were always small in size, and represented chiefly subjects in still life. Upwards of two hundred are attributed to him, and specimens are to be found in most of the great public collections of Europe. His *chef d'œuvre* is generally considered to be the Woman sick of the Dropsy, in the Louvre. The Evening School, in the Amsterdam Gallery, is the best example of the candle-light scenes in which he excelled. In the National Gallery favourable specimens are to be seen in the Poulterer's Shop and a portrait of himself. Douw's pictures brought high prices, and it is said that President Van Spiering of the Hague paid him 1000 florins a year simply for the right of pre-emption. Douw died in 1680. His most celebrated pupil was Francis Meris.

DOVE (Dutch, *Duyve*; Danish, *Due*, Icelandic, *Dufa*; German, *Taube*), a name which seems to be most commonly applied to the smaller members of the group of birds by ornithologists usually called Pigeons (*Columbæ*); but no sharp distinction can be drawn between Pigeons and Doves, and in general literature the two words are used almost indifferently, while no one species can be pointed out to which the word Dove, taken alone, seems to be absolutely proper. The largest of the group to which the name is applicable is perhaps the Ring-Dove, or Wood-Pigeon, also called in many parts of Britain Cushat and Queest (*Columba palumbus*, Linn.), a very common bird throughout these islands and most parts of Europe. It associates in winter in large flocks, the numbers of which (owing partly to the destruction of predacious animals, but still more to the modern system of agriculture, and the growth of plantations in many districts that were before treeless) have of late

years increased enormously, so that their depredations are very serious. In former days, when the breadth of land in Britain under green crops was comparatively small, these birds found little food in the dead season, and this scarcity was a natural check on their superabundance. But since the extended cultivation of turnips and plants of similar use the case is altered, and perhaps at no time of the year has provender become more plentiful than in winter. The Ring-Dove may be easily distinguished from other European species by its larger size, and especially by the white spot on either side of its neck, forming a nearly continuous "ring," whence the bird takes its name, and the large white patches in its wings, which are very conspicuous in flight. It breeds several times in the year, making for its nest a slight platform of sticks on the horizontal bough of a tree, and laying therein two eggs—which, as in all the *Columbæ*, are white.

The Stock-Dove (*C. ænas* of most authors) is a smaller species, with many of the habits of the former, but breeding by preference in the stocks of hollow trees or in rabbit-holes. It is darker in colour than the Ring-Dove, without any white on its neck or wings, and is much less common and more locally distributed.

The Rock-Dove (*C. livia*, Temm.) much resembles the Stock-Dove, but is of a lighter colour, with two black bars on its wings, and a white rump. In its wild state it haunts most of the rocky parts of the coast of Europe, from the Færoes to the Cyclades, and, seldom going inland, is comparatively rare. Yet, as it is without contradiction the parent-stem of all our domestic Pigeons, its numbers must far exceed those of both the former put together. In Egypt and various parts of Asia it is represented by what Mr Darwin has called "Wild Races," which are commonly accounted good "species" (*C. schumperi*, *C. affinis*, *C. intermedia*, *C. leuconota*, and so forth), though they differ from one another far less than do nearly all the domestic forms, of which more than 150 kinds that "breed true," and have been separately named, are known to exist. Very many of these, if found wild, would have unquestionably been ranked by the best ornithologists as distinct "species," and several of them would as undoubtedly have been placed in different genera. These various breeds are classified by Mr Darwin¹ in four groups as follows:—

GROUP I. composed of a single Race, that of the "Pouters," having the gullet of great size, barely separated from the crop, and often inflated, the body and legs elongated, and a moderate bill. The most strongly marked subrace, the *Improved English Pouter*, is considered to be the most distinct of all domesticated pigeons.

GROUP II. includes three Races—(1) "Carriers," with a long pointed bill, the eyes surrounded by much bare skin, and the neck and body much elongated, (2) "Rants," with a long, massive bill, and the body of great size, and (3) "Barbs," with a short, broad bill, much bare skin round the eyes, and the skin over the nostrils swollen. Of the first four and of the second five subraces are distinguished.

GROUP III. is confessedly artificial, and to it are assigned five Races—(1) "Fan-tails," remarkable for the extraordinary development of their tails, which may consist of as many as forty-two rectrices in place of the ordinary twelve, (2) "Turbits" and "Owls," with the feathers of the throat diverging, and a short thick bill, (3) "Tumblers," possessing the marvellous habit of tumbling backwards during flight or, in some breeds, even on the ground, and having a short, conical bill, (4) "Frill-backs," in which the feathers are reversed, and (5) "Jacobins," with the feathers of the neck forming a hood, and the wings and tail long.

GROUP IV. greatly resembles the normal form, and comprises two Races—(1) "Trumpeters," with a tuft of feathers at the base of the neck curling forward, the face much feathered, and a very peculiar voice, and (2) Pigeons scarcely differing in structure from the wild stock.

Besides these some three or four other little-known breeds exist, and the whole number of breeds and sub-breeds

¹The Variation of Animals and Plants under Domestication. London. 1868. Vol. i. pp 131-224.

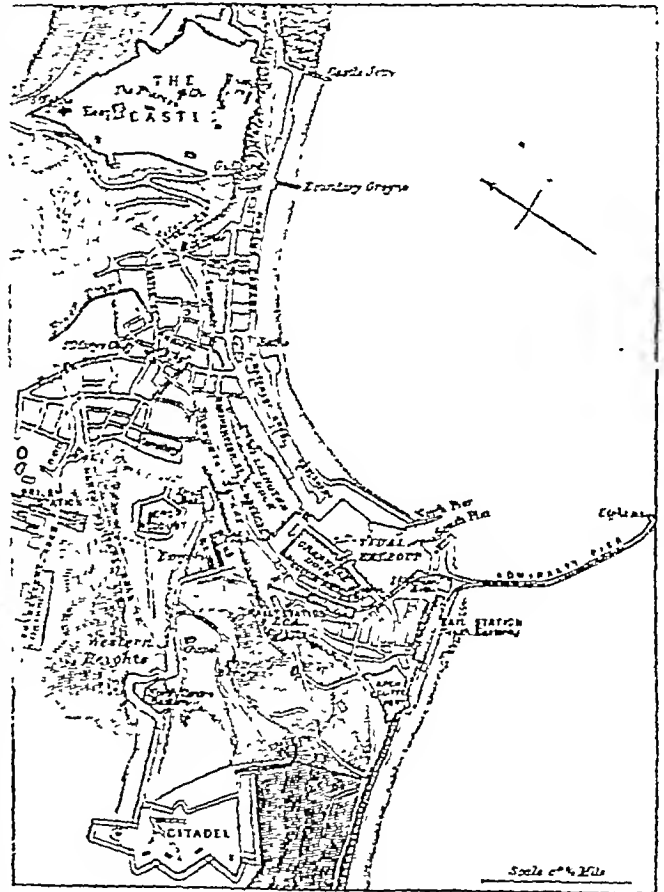

almost defies computation. The difference between them is in many cases far from being superficial, for Mr Darwin has shown that there is scarcely any part of the skeleton which is constant, and the modifications that have been effected in the proportions of the head and sternal apparatus are very remarkable. Yet the proof that all these different birds have descended from one common stock is nearly certain. Here there is no need to point out its bearing upon the "Theory of Natural Selection" which that eminent naturalist and Mr Wallace have rendered so well known. The antiquity of some of these breeds is not the least interesting part of the subject, nor is the use to which one at least of them has long been applied. The Dove from the earliest period in history has been associated with the idea of a messenger (Genesis viii. 8-12), and its employment in that capacity, developed successively by Greeks, Romans, Mussulmans, and Christians, has never been more fully made available than in our own day, as witness the "Pigeon-post" established during the recent siege of Paris.

Leaving, then, this interesting subject, space does not permit our here dwelling on various foreign species, which, if not truly belonging to the genus *Columba*, are barely comparable therefrom. Of these examples may be found in the Indian, Ethiopian, and Neotropical Regions. Still less can we here enter upon the innumerable other forms, though they may be entitled to the name of "Dove," which are to be found in almost every part of the world, and nowhere more abundantly than in the Australian Region. Mr Wallace (*Ibis*, 1865, pp. 365-400) considers that they attain their maximum development in the Papuan Subregion, where, though the land-area is less than one-sixth that of Europe, more than a quarter of all the species (some 300 in number) known to exist are found—owing, he suggests, to the absence of forest-haunting and fruit-eating Mammals.

It would, however, be impossible to conclude this article without noticing a small group of birds to which in some minds the name Dove will seem especially applicable. This is the group containing the Turtle-Doves—the time-honoured emblem of tenderness and conjugal love. The common Turtle-Dove of Europe (*Turtur auritus*) is one of those species which is gradually extending its area. In England, not much more than a century ago, it seems to have been chiefly, if not solely, known in the southern and western counties. Though in the character of a straggler only, it now reaches the extreme north of Scotland, and is perhaps nowhere more abundant than in many of the midland and eastern counties of England. On the continent the same thing has been observed, though indeed not so definitely; and this species has within the last twenty years or so appeared as a casual visitor within the Arctic Circle. The probable causes of its extension cannot here be discussed; and there is no need to dwell upon its graceful form and the delicate harmony of its modest colouring, for they are proverbial. The species is migratory, reaching Europe late in April and retiring in September. Another species, and one perhaps better known from being commonly kept in confinement, is that called by many the Collared or Barbary Dove (*T. risorius*)—the second English name probably indicating that it was by way of that country that it was brought to us, for it is not an African bird. This is distinguished by its cream-coloured plumage and black necklace. Some uncertainty seems to exist about its original home, but it is found from Constantinople to India, and is abundant in the Holy Land, though there a third species (*T. senegalensis*) also occurs, which Canon Tristram thinks is the Turtle-Dove of Scripture. (A. N.)

DOVER (the ancient Dnbris), principal cinque port of England, is sitnated close to the South Foreland, 72 miles

from London, in a main valley of the chalk hills corresponding with the opposite cliffs between Calais and Boulogne. Its dominant object is the castle, on the east heights. Within its walls stands the Roman pharos; the Romano-British fortress church, remaining not only *in situ*, but (excepting roof) integrally *in statu quo*, forming a primitive Christian relic, unique in Christendom; some remains of the Saxon fort; and the massive keep and subsidiary defences of Norman building. These ancient works provide for a garrison of 758; but they are now covered by the superior site of Fort Burgoyne, a position of great strength for 221 men. The western heights, where is still the foundation of a consort Roman pharos, form a circuit of elaborate fortifications, with provision for 3010 troops. Between these, and stretching inland, lies the town, of which the following are the principal features. 1. The harbour, once at the eastern, is now at the western extremity,—its three considerable basins being fit for mail steamers and ordinary trading vessels. 2. The admiralty pier is a massive struc-

Plan of Dover.

ture of solid concrete and masonry extending about one-third of a mile into the sea, affording lee and landing accommodation for vessels of almost any burthen, made for ultimate connection by break-water with a horn east of the castle, so inclosing the bay as a vast harbour. 3. The visitors' quarter consists of ranges of good houses along the length of the seaboard and elsewhere, notably a fine elevation newly built on a western spur of the Castle Hill. 4. Of old Dover, within its walls and gates, but little remains, except a remnant of the Saxon collegiate church of the canons of St Martin, and the parish church of St Mary the Virgin—rebuilt and enlarged in 1843-44, but preserving the three bays of the Anglo-Saxon church, with its western narthex, on which had been superimposed the Norman tower, still presenting its rich front to the street. 5. A later Norman church stands under the Castle Hill, which has been partially restored, but its parochial status trans-

ferred to the new parish church of St James. There are two other modern churches—Holy Trinity and Christ-church, and, further up the valley, the parish church of Charlton (originally Norman) and Buckland (Early English), which, including the Castle Church, completes the former number of seven for the town. There are also 13 chapels of nonconformist worship, representing most denominations, and placed in various parts of the borough. 6. The remains of the once (12th century) splendid foundation of St Martin's priory include the great gate, the house refectory with campanile, and the spacious strangers' refectory, lately converted into the college school-room. 7. Just across the High Street stand the tower and truncated fabric of the noble hall of the hospital Maison Dieu, founded (13th century) for the reception of pilgrims of all nations, long used as a Crown victualling office, but latterly purchased by the corporation and adapted for a

Corporation Seal

town hall, with prison cells as basements, and other prison buildings annexed, the former chapel of the society serving now as a court of sessions. 8. The ground work of a round (Holy Sepulchre) church of the Templars is on the opposite heights, approaching the citadel. 9. Among the centres of educational work are a proprietary college, occupying the site and remaining buildings of St Martin's Priory, for a cheap but sound education of town boys, and for boarders in the masters' houses, and also a strong array of national schools, worked up to a high mark, according to H. M. Inspectors' reports, and providing means for a good practical education of about 3400 children. In physical conditions the place is exceptionally healthy, the registrar-general's returns showing them in some years to be little below those of the Malvern Hills. The steep shore and open downs make it agreeable for bathing and summer resort; and it has constant sea-going interest from the Continental mail service, and the course of vessels up and down channel lying within two miles of the shore. Objects of interest within easy reach are—the S. Foreland electric light-houses; the (florid Norman) church of St Margaret's; the Templars' Manor, Ewell; St Radigund's Abbey; the Preceptory of Knights of St John, Swingfield, rich Norman votive chapel, Barfreystone. There are two lines of railway to London—one traversing the Weald of Kent, the other following the old Roman road, *via* Canterbury and Rochester. Dover returns 2 members to Parliament, and is governed by a mayor, 6 aldermen, and 18 councillors. The area of the borough is 1262 acres. Population (1871), 28,590.

DOVER, a city of the United States, capital of Strafford county, New Hampshire, situated on the Cocheco, a tributary of the Piscataqua, at a railway junction twelve miles north-west of Portsmouth. It has eight churches, a high school, a city hall, and a public library; and the water-power furnished by the falls of the Cocheco encourages its industrial activity, the principal results of which are prints and other cotton goods to the value of upwards of £200,000 annually; woollens, leather, boots and shoes, hats, oil-cloth sand-paper, iron and brass wares,

and carriages. The town was founded in 1623, and received its city charter in 1855. Population in 1870, 9294.

DOVER, a town of the United States, the capital of Delaware, on Jones Creek, 9 miles inland from Delaware Bay, and 48 miles south of Wilmington. It is a regular brick-built place, with broad, well-shaded streets, has a State house, a court-house, six churches, an academy, and several other public buildings, and carries on a brisk trade in preserved fruits. Population in 1870, 1903, of whom 501 were people of colour.

DOVER, GEORGE JAMES WELBORE AGAR ELLIS, BARON (1797–1833), born on the 14th January 1797, was the eldest son of the second Viscount Chliden. He was educated at Christ Church, Oxford, and in 1818 he was returned to Parliament as member for Heytesbury. He afterwards represented Seaford (1820), Ludgershall (1826), and Oakhampton (1830). In party politics he took little interest; but he was a zealous and enlightened advocate in Parliament and elsewhere of state encouragement being given to the cause of literature and the fine arts. In 1824 he was the leading promoter of the grant of £57,000 for the purchase of Mr Angerstein's collection of pictures, which formed the foundation of the National Gallery. On the formation of Lord Grey's administration, in November 1830, he was appointed chief commissioner of woods and forests. The post was one for which his tastes well fitted him, but he was compelled by delicate health to resign it after two months' occupancy. In June 1831, during the lifetime of his father, he was raised to the House of Lords under the title of Baron Dover. His services to the cause of learning and the fine arts, as well as his own distinction as an author, led in 1832 to his election to the presidency of the Royal Society of Literature. He died on the 10th July 1833. Lord Dover's literary works were chiefly historical, and included *The True History of the Iron Mask*, extracted from Documents in the French Archives (1826), *Historical Inquiries respecting the Character of Clarendon* (1827), and a *Life of Frederick the Great* (1831). He also edited the *Ellis Correspondence* and *Walpole's Letters to Sir Horace Mann*. He left in manuscript a volume written for the instruction of his son, which was published posthumously under the title *Lives of the Most Eminent Sovereigns of Modern Europe*. A fourth edition of this work appeared in 1853.

DOW, LORENZO (1777–1834), an American preacher, noted for his eccentricities of dress and manner, was born at Coventry, Connecticut, U.S., October 16, 1777. He received but a limited education, and was much troubled in his youth by religious perplexities; but he ultimately joined the Methodists, and was appointed a preacher (1799). The same year, however, his official connection with that body ceased, and he came over to preach to the Catholics of Ireland. He attracted great crowds to hear and see him, and was often persecuted as well as admired. He also visited England, introduced the system of camp meetings, and thus led the way to the formation of the Primitive Methodist Society. These visits were repeated in 1805. Dow's enthusiasm sustained him through the incessant labours of more than thirty years, during which he preached in almost all parts of the United States. His later efforts were chiefly directed against the Jesuits. His *Polemical Works* were published in 1814. Among his other writings are *The Stranger in Charleston, or the Trial and Confession of Lorenzo Dow* (1822), *A Short Account of a Long Travel* (1823), and the *History of a Cosmopolite*. He died February 2, 1834.

DOWLETABAD, a city and fortress of India, in the north-western corner of the Nizam's Dominions, near one of the right-hand tributaries of the Godavery. Though

still the centre of an administrative district, the city has sunk into comparative insignificance since the rise of Aurungabad, about ten miles to the east; but the fortress remains, from its natural position, one of the most remarkable in the country. It occupies the conical top of a great granite rock, which rises abruptly from the plain to a height of at least 300 feet, and is encompassed at the foot by a ditch upwards of 30 feet wide. The only means of access to the summit is afforded by a narrow bridge, with passage for not more than two men abreast, and a long gallery, excavated in the rock, which has for the most part a very gradual upward slope, but about midway is intercepted by a steep stair, the top of which is covered by a grating destined in time of war to form the hearth of a huge fire kept burning by the garrison above. In spite, however, of its natural strength and its various artificial defences, the fortress has frequently been taken. When about the year 1203 the Mahometans invaded this part of the Deccan, Deogurh, as the city was then called, was the wealthy residence of a powerful rajah. In 1306 it was occupied by Mallek Naib, the emperor of Delhi's general, and in the early part of the same century Mahomet III., in his anxiety to make it the capital of his kingdom and worthy of its new name of Dowletabad, or Abode of Prosperity, endeavoured, but in vain, to cause a wholesale transmigration of the inhabitants of Delhi. About the year 1595 it surrendered to Ahmed Nizam, shah of Ahmadnagar; and on the fall of his dynasty it was taken possession of by Mallek Amber, an Abyssinian slave. His successors reigned till 1634, when it was taken by the Moguls, who transferred the seat of government to Aurungabad. In the 18th century it passed into the possession of Nizam el Mulk.

DOWN, a maritime county of Ireland, in the province of Ulster, occupying the most easterly part of the island, is bounded N. by the county Antrim and Belfast Lough, E and S by the Irish Sea, and W. by the county Armagh. Its area, including Ballymacarret, a suburb of Belfast (1670 acres), covers 967 square miles, or 612,409 acres. The coast-line is very irregular, and is indented by several loughs and bays. The largest of these is Strangford Lough, a fine sheet of water studded with 260 islets, 54 of which have names, and all of which are finely wooded or rich in pasture. The lough runs for ten miles northwards, and the ancient castles and ruined abbeys on the islets render the scene one of singular interest and beauty. Further south Dundrum Bay forms a wider expanse of water. In the south-west Carlingford Lough separates the county from Louth. On its north-east shore lies the village of Rosstrevor, now the resort of invalids from all parts of the United Kingdom.

Mountains—Between Strangford and Carlingford loughs the county is occupied by a range of hills known in its south-western portion as the Mourne Mountains, which give rise to the four principal rivers—the Bann, the Lagan, the Annacloy, and the Newry. The highest peak in the Mourne range is named Slieve Donard. It is 2796 feet above the level of the sea, and is exceeded only by one peak, Lngduff, in the Wicklow range, and the higher reeks in Killarney.

Springs—Down is celebrated for its holy wells and mineral springs. The chalybeate are more numerous than the sulphurous, but both abound. There are springs at Ardmullan, Granshaw, Dundonnell, Magheralin, Dromore, Newry, Banbridge, and Tierkelly. The Struel springs, a mile south-east of the town of Downpatrick, are celebrated for their healing properties. Fifty years ago they were regarded as possessing not only chemical wealth in rare abundance, but miraculous powers; and the decline of public credulity in the latter was coincident with the failure

of the former. To this day, however, the wells, which are four in number, are visited, and certain religious observances maintained, sometimes for a week. Circuits on the knees are made round the wells, and amongst the ignorant the reputation of the sacred waters remains unimpaired.

The scenery of the county is pleasantly diversified, the people are intelligent and comparatively well educated, the landed proprietors are resident, and there is a thriving independence which may be looked for in vain outside the province of Ulster.

Minerals—There are several quarries of fine sandstone. The best is that on Scrabb Hill, near Newtownards, where a very close-grained, clear-coloured; and hard and durable stone is raised. Limestone is not very general. Near Comber, on the shores of Strangford Lough, is a very hard and sparkling kind of reddish granular limestone. But the greatest magazine of this rock is in the vicinity of Moira, where the stone lies very near the surface. Granite occurs in many places in detached masses, but the great body of it is confined to the southern and western regions, chiefly in the Mourne Mountains. Crystals of topaz and beryl are found in the granite of Slieve Donard. Indications of lead have been discovered near Castletwellan, Killough, Newtownards, and Warrenpoint, and traces of copper in the Mourne Mountains near Rosstrevor.

Soil—The predominating soil is a loam of little depth, in most places intermixed with considerable quantities of stones of various sizes, but differing materially in character according to the nature of the subsoil. Clay is mostly confined to the eastern coast, and to the northern parts of Castlereagh. Of sandy soil the quantity is small; it occurs chiefly near Dundrum. Moor grounds are mostly confined to the skirts of the mountains. Bogs, though frequent, are scarcely sufficient to furnish a supply of fuel to the population.

According to Owners of Land Return (1876), there were, in 1875, 3605 separate proprietors, owning a total area of 608,214 acres, valued at £776,518. The number of owners of less than 1 acre numbered 1460, or 40½ per cent, that of all Ulster being 48 per cent. The average size of the properties was 168½ acres, and the average value per acre was £1, 5s 6¼d, as against 239¼ acres and 15s 8¼d respectively for Ulster. As in the neighbouring counties of Antrim and Armagh, the value of the land in Down is considerably higher than that of the rest of the province. Eighteen proprietors owned upwards of 6000 acres each, and among them an aggregate extent equal to 48½ per cent. of the total area,—the principle holders being—Marquis of Downshire (Hillsborough), 64,356 acres; the Kilmerley Trustees, 37,454, Earl of Annesley (Castletwellan), 23,567; Marquis of Londonderry (Newtownards), 23,554; Colonel W. B. Forde (Seaford), 19,882; Earl Dufferin (Clandeboey), 18,238; Hon. R. Meade's trustees (Dromore), 13,492; R. N. Batt (Belfast), 12,010; and Lord A. E. Hill-Trevor, 10,940.

Agriculture—Of the total area of the county, which is 610,740 acres (exclusive of Ballymacarret), there are 339,541 acres under tillage, 187,604 in pasture, and 12,027 under wood. Although comparisons as to yields of crops between different periods is now fallacious, inasmuch as the increased and increasing importation of wheat into Ireland has altered the system of agriculture, it may be mentioned that, while in five years the cultivation of wheat has fallen from 244,451 acres to 119,597 in Ireland, during the same period in Down the decrease was from 32,734 acres to 21,272. There are many landed proprietors who hold large tracts in their own hands. The great bulk of the labouring population is orderly and industrious. Their dwellings are better constructed and furnished than those for a similar class in other parts of Ireland. The pro-

cesses of agriculture, owing in a great degree to the example set by the resident gentry, are skilfully carried on. The land is well cultivated. The farms are in some districts small, but the effect of emigration has been to consolidate the holdings.

The breed of horses is an object of much attention, and some of the best racers in Ireland have been bred in this county. The native breed of sheep, a small hardy race, is confined to the mountains. The various other kinds of sheep have been much improved by judicious crosses from the best breeds. Hogs are reared in great numbers, chiefly for the Belfast market, where the large exportation occasions a constant demand for them, hams of very superior quality being prepared in that town.

The following figures give the acreage of the principal crops and the numbers of live stock raised in the years 1873 and 1876 respectively :—

	Wheat.	Oats.	Potatoes	Turnips	Flax.
1873	24,783	118,342	53,266	21,117	27,098
1876	21,272	119,857	52,273	20,973	23,612
	Horses and mules	Cattle.	Sheep	Pigs	Goats.
1873	32,183	146,071	75,406	32,827	11,434
1876	31,875	143,832	68,968	51,327	11,227

Along with Tyrone, the county grows the largest extent of flax in Ireland, and the largest extent of the other cereals of any county in Ulster. In live stock Down possesses a greater number of horses than any other Irish county with the exception of Cork.

Fisheries.—These are not developed as they might be. The Kilkeel herring fishery realized £4203 in 1871, £6200 in 1872, £13,319 in 1873, £6000 in 1874, and £1360 in 1875. There are fishing stations at Donaghadee, Strangford, Newcastle, and Carlingford, the total number of vessels in 1875 was 678, and of men and boys 2537. In 1850 there were 1468 vessels and 4640 hands.

Administration.—The county is divided into 14 baronies, 70 parishes, and 1258 town-lands. It forms part of the united dioceses of Down, Connor, and Dromore; and it belongs to the military district of Belfast. The assizes are held at Downpatrick; quarter sessions at Banbridge, Downpatrick, Hillsborough, Newry, and Newtownards; and there are 26 petty sessions districts. The poor-law unions of Downpatrick, Kilkeel, and Newtownards are wholly within the county, and those of Banbridge and Newry partly in Down and partly in Armagh. The total sum expended in poor-law administration in 1875 was £21,076, and the average daily number of paupers 1280. The county prison and infirmary are in Downpatrick, but the county lunatic asylum is in Belfast. Down returns 4 members to Parliament—2 for the county at large, 1 for Downpatrick, and 1 for Newry. Portions of the boroughs of Belfast and Lisburn are in Down county, but they are regarded more properly as parts of Antrim and Armagh respectively. Previous to the Act of Union Down returned 14 members to the Irish Parliament—2 for the county at large, and 2 each for the boroughs of Bangor, Downpatrick, Hillsborough, Newry, Newtownards, and Killyleagh.

Population.—The general decrease of population in the province of Ulster between the census of 1851 and that of 1871 indicates a percentage of $8\frac{1}{2}$, while that of this county amounts to 13 $\frac{1}{2}$. This decrease may be ascribed in some part to the migration of the people to Belfast and the neighbouring manufacturing towns, as well as to the emigration to foreign countries. In 1851, the inhabitants of Down (exclusive of the part of Belfast) numbered 320,817; in 1861, 299,302, and in 1871, 277,294, of whom 130,457 were males and 146,837 females.

At the last census it appeared that 31 $\frac{3}{4}$ per cent. belonged to the Roman Catholic persuasion, the numbers

being—Catholics, 88,003; Episcopalians, 60,868; Presbyterians, 116,017; and others, 12,406. There were at the same time 140,886 persons of five years and upwards who could read and write, 57,140 who could read but could not write, and 45,792 who were illiterate. There were 20 superior schools in the county, and 527 primary schools.

The following are the principal towns :—Newtownards, population 9562; Banbridge, 5600; Downpatrick, 4155; Holywood, 3573; Gilford, 2720; Bangor, 2560; Dromore, 2408; Donaghadee, 2226; Comber, 2006; Portaferry, 1938; Rathfriland, 1827; Warrenpoint, 1806; Killyleagh, 1772; Kilkeel, 1338; and Ballynahinch, 1225. Newry, partly in Down and partly in Armagh county, has a population of 14,213.

History and Antiquities.—From the period of the English settlement to the Irish revolt in 1333, Down formed two counties, Newtownards in the north and Down in the south. The English settlers at that time were driven into the maritime baronies of Ards, Lecale, and Mourne, of which they in part retained possession. The remainder of the district fell into the hands of Irish families, the O'Neals of Clandeboy, the MacArtauns, MacRorys, and MacGinnises, whose possessions, however, reverted to the crown on the attainder of Shane O'Neal, in the latter half of the 16th century; but having afterwards submitted to the Government, they received back their former estates. In 1602 the O'Neal estates were again forfeited, and granted to Sir Hugh Montgomery and Mr Hamilton, who planted Scottish colonies on the land. The estates of the remaining old Irish and Anglo-Norman families were mostly forfeited in the rebellion of 1641, or subsequently at the Revolution.

The county is not wanting in interesting remains. At Shiddyford, near Dundrum, there is a group of ten or twelve pillar stones in a circle, about 10 ten feet in height. A very curious cairn on the summit of Shere Croob is 80 yards in circumference at the base and 50 at the top, where is a platform on which carns of various heights are found standing. The village of Anadorn is famed for a cairn covering a cave which contains ashes and human bones. Cromlechs, or altars, are numerous, the most remarkable being the Giant's Ring, which stands on the summit of a hill near the borders of Antrim. This altar is formed of an unwrought stone 7 feet long by 6 $\frac{1}{2}$ broad, resting in an inclined position on rude pillars about 3 feet high. This solitary landmark is in the centre of an enclosure about a third of a mile in circumference, formed of a rampart about 20 feet high, and broad enough atop to permit two persons to ride abreast. Near Downpatrick is a rath, or mound of earth, three-quarters of a mile in circumference, its exterior consisting of three artificial ramparts, the largest of which is 30 feet broad. In its vicinity are the ruins of Saul Abbey, said to have been founded by St Patrick, and Inch Abbey, founded by Sir John de Courcy in 1180. The number of monastic ruins is also considerable. The most ancient and celebrated is the abbey or cathedral of Downpatrick, supposed to have been founded by St Patrick soon after his arrival here in 432, and said to contain his remains, together with those of St Columba and St Bridget. It was restored in 1790, when the adjoining round tower was taken down. (E. T. L.)

DOWNPATRICK, a municipal and parliamentary borough and market-town of Ireland, capital of the county of Down, 18 miles S.E. of Belfast, and 74 N.N.E. of Dublin. Downpatrick lies in a valley formed by hills of some elevation, near the south-west extremity of Strangford Lough, and is divided into the English, Irish, and Scotch quarters. It consists of four main streets meeting near the centre, the principal of which are the Irish and English streets. In the former all business is carried on; the latter is well built, and contains neat private residences.

The principal buildings are the cathedral church of the diocese, the parish church, Roman Catholic chapel, two Presbyterians and two Methodist meeting-houses, diocesan school, county court-house, prison, alms-houses, two branch banks, barracks, infirmary, and fever hospital. A small trade is carried on at Strangford Lough by means of vessels of 100 tons, which discharge at Quoil quay, about a mile from the town; but vessels of larger tonnage can discharge at a steamboat quay built lower down the Quoil. The imports are principally iron, coal, salt, and timber; the exports—barley, oats, cattle, pigs, and potatoes. The linen manufacture is also carried on. The County Down Railway connects the town with the other trading centres, and a line specially constructed in 1862 connects it with the port of Donaghadee. Brewing, tanning, and soap-making give considerable employment. The Down corporation races are very popular, and are regarded as a meeting for the province. The parliamentary borough, which returns one member to Parliament, had in 1871 a population of 4155, with an area of 1486 acres; the area of the town is 278 acres, population 3621.

DOXOLOGY, a hymn in praise of the Almighty. The name is often applied to the Trisagion, or "Holy, Holy, Holy," the scriptural basis of which is found in Isaiah vi. 3, to the Hallelujah of several of the Psalms and of Rev. xix.; and to the last clause of the Lord's Prayer according to Saint Matthew, which critics are generally agreed in regarding as an interpolation. It is used, however, more definitely as the designation of two hymns distinguished by liturgical writers as the Greater and Lesser Doxologies. The origin and history of these it is impossible to trace fully. The germ of both is to be found in the Gospels; the first words of the Greater Doxology, or *Gloria in Excelsis*, being taken from Luke ii. 14, and the form of the Lesser Doxology, or *Gloria Patri*, having been in all probability first suggested by Matt. xxviii. 19. The Greater Doxology, in a form approximating to that of the English prayer-book, is given in the *Apostolical Constitutions* (vii. 47). This is the earliest record of it, unless, indeed, the *Apostolical Constitutions* be taken to be of a later date than the Alexandrine Codex, where the hymn also occurs. Aleuin attributes the authorship of the Latin form—the *Gloria in Excelsis*—to St Hilary of Poitiers (died 368), but this is at best only a plausible conjecture. The quotations from the hymn in the *De Virginitate* of Athanasius, and in Chrysostom (*Hom. 69 in Matth.*), include only the opening words (those from St Luke's gospel), though the passage in Athanasius shows by an *et cætera* that only the commencement of the hymn is given. These references indicate that the hymn was used in private devotions, as it does not appear in any of the earliest liturgies, whether Eastern or Western, its introduction into the public services of the church was probably of a later date than has often been supposed. Its first introduction into the Roman liturgy is due to Pope Symmachus (498–514), who ordered it to be sung on Sundays and festival days. The Mozarabic liturgy provides for its encharistic use on Sundays and festivals. In these and other early liturgies the Greater Doxology occurs immediately after the commencement of the service; in the English prayer-book it is introduced at the close of the communion office, but it does not occur in either the morning or evening service. The Lesser Doxology, or *Gloria Patri*, combines the character of a creed with that of a hymn. In its earliest form it ran simply—"Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen," or "Glory be to the Father, in or by the Son, and by the Holy Ghost." Until the rise of the Arian heresy these forms were probably regarded as indifferent, both being equally capable of an orthodox

interpretation. When the Arians, however, finding the second form more consistent with their views, adopted it persistently and exclusively, its use was naturally discountenanced by the Catholics, and the other form became the symbol of orthodoxy. To the influence of the Arian heresy is also obviously due the addition of the clause—"as it was in the beginning, is now, and ever shall be," the use of which was, according to some authorities, expressly enjoined by the Council of Nicæa. There is no sufficient evidence of this, but there exists a decree of the second Council of Vaison (529), asserting its use as already established in the East *propter hæreticorum astutiam*, and ordering its adoption throughout the churches of the West. In the Western Church the *Gloria Patri* is repeated at the close of every psalm, in the Eastern church at the close of the last psalm.

DOYEN, GABRIEL FRANÇOIS (1726–1806), an eminent French painter, was born at Paris in 1726. His passion for art prevailed over his father's wish, and he became in his twelfth year a pupil of Vauloo. Making rapid progress, he obtained at twenty the grand prize, and in 1748 set out for Rome. He studied the works of Annibale Caracci, Cortona, Giulio Romano, and Michelangelo, then visited Naples, Venice, Bologna, and other Italian cities, and in 1755 returned to Paris. At first unappreciated and disparaged, he resolved by one grand effort to conquer a reputation, and in 1758 he exhibited his *Death of Virginia*. It was completely successful, and procured him admission to the Academy. Among his greatest works are reckoned,—the *Miracle des Ardents*, painted for the church of St Geneviève at St Roch (1773); the *Triumph of Thetis*, for the chapel of the Invalides; and the *Death of St Louis*, for the chapel of the Military School. In 1776 he was appointed professor at the Academy of Painting. Soon after the beginning of the Revolution he accepted the invitation of Catherine II. and settled at St Petersburg, where he was loaded with honours and rewards. He died there June 5, 1806.

DRACO, a celebrated Athenian legislator who flourished in the 7th century B.C. By a strange irony of fate his name has passed into a proverb for an inexorable lawgiver, whose laws were written with blood and not with ink. Modern Greek historians, such as Thirlwall, Grote, and Curtius, have clearly shown that such a character is an utter perversion of fact. Of Draco's famous code not a single line remains, and all we know of it is derived from a few scattered notices occurring mostly in late Greek authors. Of these the most important is a passage in Plutarch's life of Solon. After stating that Solon abolished the whole of Draco's legislation, except in cases of murder, on account of its harshness and severity, Plutarch adds by way of commentary—"For for nearly all crimes there was the same penalty of death. The man who was convicted of idleness, or who stole a cabbage or an apple, was liable to death no less than the robber of temples or the murderer." To the same effect is a traditional saying of Draco by which he justified the rigour of his laws. The least offence, he said, seemed to him deserving of death, and he could devise no greater for the worst crime. It is obvious that the statement of Plutarch is not meant to be accepted as a literal statement of fact, and it is probable that to the most bloodthirsty of Draco's laws parallels might be quoted from English statutes against vagrancy and theft. All that Draco did was to put in writing the customary laws of his time and nation. It was natural that these laws, the growth of a rude and primitive age, should strike writers of the Augustan age as indiscriminate and inhuman. That he made no change in the constitution of Athens we have the express testimony of Aristotle. The judicial changes which he effected, so far from aggravating, all

tended to mitigate the severity of early Athenian law. Before his time all cases of homicide were tried by the Areopagus, and we are justified in inferring that death was the universal penalty. To Draco is generally attributed the establishment of the *ἐφερα*, a body of fifty-one elders, who sat in four different courts,—one for cases of accidental homicide, a second for justifiable homicide, a third for cases where another homicide had been committed abroad by a prisoner who had been banished by one of the above-named courts, and a fourth for cases of deodand. Such an institution is of itself enough to explode the traditional conception of Draco, and we may now proceed to discuss the true character of his legislation. At Athens, as at Rome, the kings were the depositaries and administrators of law. With the extinction of the regal power this prerogative passed into the hands of the aristocracy as represented by the archons. It was in the nature of things that such a monopoly should be abused. The remedy for this abuse which the commons sought was a published code of laws. It was attained at Rome by the law of the Twelve Tables, and at Athens by the code of Draco, 621 B.C. In both cases the promulgated law was merely an enunciation of existing customs. Such was the work of Draco. Of his life we know absolutely nothing with the exception of a most improbable story related by Suidas. In Suidas's *Lexicon*, under the word "Draco," we are told that he composed his code in his old age, and was smothered to death in the theatre at Ægina with the caps, chitons, and cloaks which were thrown at him by an enthusiastic audience. The only value of the story is that it may show the feelings with which he was regarded by the commons of his own day.

DRAGON (δράκων, sharp-sighted), the name given by the ancients to a fabulous monster represented by them as a huge winged lizard or serpent. They regarded it as the enemy of mankind, and its overthrow is made to figure among the greatest exploits of the gods and heroes of heathen mythology. A dragon watched the garden of the Hesperides, and its destruction formed one of the seven labours of Hercules. Its existence does not seem to have been called in question by the older naturalists, figures of the dragon appearing in the works of Gesner and Aldrovandi, and even specimens of the monster—evidently formed artificially of portions of various animals—having been exhibited. The only creatures ever known to have existed, at all comparable to this imaginary monster, are the Pterodactyls, remains of which are found in the Liassic and Oolitic formations. These were huge reptiles, provided with true wings somewhat resembling those of bats. The name "dragon" is now applied to a highly interesting, but very harmless, group of small flying lizards forming the genus *Draco*, belonging to the *Agamidae*, a family of Saurian Reptiles. They inhabit India and the islands of the Malay Archipelago, and 18 species of them are known. They are small creatures, measuring about 10 inches long, including the tail, which in some cases is more than half of the entire length. The head is small, and the throat is provided with three pouches which are spread out when they lie on the trunks of trees. They are, however, chiefly remarkable for the wing-like cutaneous processes with which their sides are provided, and which are extended and supported by greatly elongated ribs. These form a sort of parachute by which the animals are enabled to glide from branch to branch of the trees on which they reside, but, being altogether independent of the fore limbs, they cannot be regarded as true wings, nor do they enable the lizard to fly, but merely to make extensive leaps. When not in use they are folded by the side after the manner of a fan, and the dragon can then walk or run with considerable agility. They also use their wing-like expansions in claspings the branches

of trees, where they are fond of lying basking in the sun, and feeding on whatever insect may come in their way. When threatened with danger they are said to feign death.

DRAGON-FLY (German, *Wassjungfer*; Swedish, *Trollslunda*; Danish, *Guldsmed*, Dutch, *Scherpstekende-vlieg*; French, *Demoiselle*), the popular English name applied to the members of a remarkable group of insects which formed the genus *Libellula* of Linnæus and the ancient authors. In some parts of the United States they appear to be known as "Devil's Darning Needles," and in many parts of England are termed "Horse-stingers." It is almost needless to say that (excepting to other insects upon which they prey) they are perfectly innocuous, though some of the larger species can inflict a momentarily painful bite with their powerful jaws. Their systematic position is at present contested and somewhat uncertain. By most of the older systematists they were placed as forming part of the heterogeneous order *Neuroptera*. Fabricius, however, elevated them to the rank of a distinct order, which he termed *Odonata*; and whatever may be the difference of opinion amongst authors at the present day, that term is almost universally employed for the group. Erichson transferred all the groups of so-called *Neuroptera* with incomplete metamorphoses, hence including the dragon-flies, as a division of *Orthoptera*, which he termed *Pseudo-Neuroptera*. Gerstaecker more recently also retains them in the *Orthoptera*, terming those groups in which the earlier states are sub-aquatic *Orthoptera amphibiotica*. It is not necessary to enter into an examination here of the merits or demerits of those various systems, and it will suffice to say that all are agreed in maintaining the insects as forming a group marked by characters at once extraordinary and isolated in their nature.

The group *Odonata* (using the term as a matter of convenience) is divided into three families, and each of these again into two sub-families. The families are the *Agriionidae*, *Æschnidae*, and *Libellulidae*,—the first including the sub-families *Calopterygina* and *Agrionina*, the second *Gomphina* and *Æschnina*, and the third *Cordulina* and *Libellulina*.

The structure of a dragon-fly being so very remarkable, it is necessary to enter somewhat extensively into details. The head is comparatively small, and excavated posteriorly, connected very slightly with the prothorax, on which it turns almost as on a pivot. The eyes are, as a rule, enormous, often contiguous, and occupying nearly the whole of the upper surface of the head, but sometimes (*Agrionidae* and *Gomphina*) widely distant; occupied by innumerable facets, which are often larger on the upper portion. In front of them is a portion termed the vertex, which sometimes (*Libellulidae*) forms a swollen vesicle, before which are placed the three very small ocelli, and on either side of which are inserted the antennæ, which are smaller in proportion than in almost any other insects, consisting only of two short swollen basal joints and a 5 or 6-jointed bristle-like thread. The front of the head is vertical, and consists of a large, often dilated upper portion, which is commonly termed the *nasus*, followed by a transverse portion termed the *rhinarium*, and this again by the large labrum, which conceals the jaws and inner mouth parts. The lower lip, or labium, is attached to a very small chin piece (or mentum), and is generally very large, often (*Agrionidae*) divided almost to its base into two portions, or more frequently entire or nearly so; on each side of it are two usually enormous hypertrophied pieces, which form the "palpi," and which are often furnished at the tips with an articulated spine (or terminal joint), the whole structure serving to retain the prey. Considerable diversity of opinion exists

with respect to the composition of the mouth parts, and by some authors the "palpi" have been termed the side pieces of the lower lip. In a dead dragon-fly the parts are closed on each other, and, for a just appreciation of their structure and power, it is necessary to take a living example in the fingers by the thorax, slight lateral pressure on which causes the insect to display the formidable arrangement. The prothorax is extremely small, consisting of only a narrow ring, the upper portion of which is often elevated into lobes. The rest of the thorax is very large, and consolidated into a single piece, with oblique sutures on the sides beneath the wings; the portion in front of the wings is extremely robust, and offers a median carina or suture above, and a broad transverse sinus posteriorly. The interalar portion is somewhat excavated, and on each side of it above are nodosities forming the attachments of the powerful muscles that work the wings; on each side is a large and distinct spiracle. The abdomen varies excessively in form, the two extremes being the filiform structure observable in most *Agrionidæ*, and the very broad and depressed formation seen in our familiar *Libellula depressa*. It consists of ten distinct segments, whereof the basal two and those at the apex are short, the others elongate, the first being excessively short. In a slit on the under side of the second in the male, accompanied by external protuberances, are concealed the genital organs: on the under side of the eighth in the female is a scale-like formation, indicating the entrance to the oviduct. The tenth is always provided in both sexes with prominent appendages, differing greatly in form, and often furnishing the best specific (and even generic) characters; by some authors these appendages are considered as representing a modified eleventh segment. The basal segments often have additional transverse sutures, and in the common triquetrous abdomen there is a fine longitudinal dorsal carina, and prominent lateral angles; invariably the ventral surface has a longitudinal membranous space connecting the here divided chitinous portion of the external skeleton. The legs vary in length and stoniness, but may, as a rule, be termed long and slender, and in a measure that appears disproportionate to the necessities of the insect; for a dragon-fly can scarcely be said to walk after the short promenade it takes on emerging from its puparium. The anterior pair probably assist in capturing and holding its insect prey, but the greatest service all the legs render is possibly in enabling the creature to rest lightly, so that it can quit a position of repose in chase of passing prey in the quickest possible manner, in which the majority of the species are aided also by the horizontally extended wings. The coxa is short and stout, followed by a still shorter trochanter; the femora and tibiae long and slender, almost invariably furnished on their under surface with two series of strong spines, as also are the tarsi, which consist of three slender joints, the last having two long and slender claws, usually (but not invariably) with a small tooth internally below the tips; the palms are absent or nearly so, and naturally are not necessary in a non-ambulatory insect. The wings are always elongate, and furnished with strong longitudinal venation and dense transverse nervules strengthening the already strong (although typically transparent) membrane. In the *Agrionidæ* both pairs are nearly equal, and are carried vertically and longitudinally in repose, and the venation and membrane are less strong; hence the species of this family are not so powerful on the wing as are those of the other groups in which the wings are horizontally extended in a position ready for instant service. The venation is peculiar, and in many respects without precise analogy in other groups of insects, but it is not necessary here to enter into more than some special points. On the costal margin (excepting in some *Calopterygina*) there is a

small dark space limited by nervules, termed the pterostigma; and between this and the base of the wing is a point termed the "nodus," at which the sub-costal nervure is suddenly arrested. The arrangement of the nervures at the base of the wing is very singular, and slight differences in its form useful aids to classification. In the *Æschnidæ* and *Libellulidæ* this arrangement results in the formation of a triangular space (known as the "triangle"), which is either open or traversed by nervules; but in many *Agrionidæ* this space, instead of being triangular, is oblong or elongately quadrate, or with its upper edge partly straight and partly oblique. This fixation of type in venation is not one of the least important of the many peculiarities exhibited in these insects.

The internal structure is comparatively simple. The salivary glands appear to be absent, and the whole digestive apparatus consists of an elongate canal extending from mouth to anus, comprising the œsophagus, stomach, and intestine, with certain dilatations and constrictions; the characteristic Malpighian vessels are stated to number about forty, placed round the posterior extremity of the stomach. Dragon-flies eat their prey completely, and do not content themselves by merely sucking its juices; the harder portions are rejected as elongate, nearly dry, pellets of excrement.

But the most extraordinary feature in the economy, —one which has attracted the attention of naturalists from remote times,—is the position of the genital organs, and the corresponding anomalous manner in which the pairing of the sexes and impregnation is effected. In the male the intromittent organ is (as stated above) situated in a slit on the under surface of the second abdominal segment; it is usually very crooked or sinuous in form, and is accompanied by sheaths, and by external hooks or secondary appendages, and also by seminal vessels. But the ducts of the vessels connected with the testes unite and open on the under surface of the ninth segment; hence, before copulation can take place, it is necessary that the vessels in the second segment be charged from this opening, and in the majority of cases this is done by the male previously to seeking the female. In the latter sex the entrance to the oviduct and genital organs is on the under surface of the eighth abdominal segment. The act of pairing may be briefly stated as follows. The male, when flying, seizes the prothorax of the female with the strong appendages at the extremity of the abdomen, and the abdomen of this latter sex is then curved upward so as to bring the under side of the eighth segment into contact with the organs of the second segment of the male. This act must have been observed by all, though but few non-entomologists are acquainted with the reasons for this most extraordinary position. In the more powerful *Libellulidæ*, &c., the act is of short duration, and it is probable that polygamy and polyandry exist, for it possibly requires more than one almost momentary act to fertilize all the eggs in the ovaries of a female. But in many *Agrionidæ*, and in some others, the male keeps his hold of the prothorax of the female for a lengthened period, retaining himself in flight in an almost perpendicular manner, and it may be that the deposition of eggs and pairing goes on alternately. There is, however, much yet to be learned on these points. The gravid female usually lays her eggs in masses (but perhaps sometimes singly), and the operation may be witnessed by any one in localities frequented by these insects. She hovers for a considerable time over nearly the same spot, rapidly dipping the apex of her abdomen into the water, or at any rate touching it, and often in places where there are no water-weeds, so that in all probability the eggs fall at once to the bottom. But in some of the *Agrionidæ* the female has been often noticed

by trustworthy observers to creep down the stems of aquatic plants several inches below the surface, emerging after the act of oviposition has been effected, and in the case of *Lestes sponsa*, Von Siebold saw the male descend with the female. The same exact observer noticed also in this species that the female makes slight incisions in the stems or leaves of water plants with the double serrated apparatus (vulva) forming a prolongation of the ninth segment beneath, depositing an egg in each excision. He has seen two pairs thus occupied beneath the surface on one and the same stem.

FIG. 1.—The anterior portion of the body of *Eschna cyanea* freed from the puparium.

FIG. 2.—The tail being extricated.

The duration of the sub-aquatic life of a dragon-fly is no doubt variable, according to the species. In the smaller forms it is probably less than a year, but precise evidence is wanting as to the occurrence of two broods in one year. On the other hand, it is certain that often a longer period

FIG. 3.—The whole body extricated.

is requisite to enable the creature to attain its full growth, and three years have been stated to be necessary for this in the large and powerful *Anax formosus*. Like all insects with incomplete metamorphoses, there is no quiescent pupal condition, no sharp line of demarcation between the larval and so-called "nymph" or penultimate stage. The creature goes on eating and increasing in size from the moment

it emerges from the egg to the time when it leaves the water to be transformed into the aerial perfect insect. The number of moults is uncertain, but they are without doubt numerous. At probably about the antepenultimate of these operations, the rudimentary wings begin to appear as thoracic buddings, and in the full-grown nymph these wings overlap about one-half of the dorsal surface of the abdomen. In structure there is a certain amount of resemblance to the perfect insect, but the body is always much stouter and shorter, in some cases most disproportionately so, and the eyes are always separated; even in those genera (e.g., *Eschna*) in which the eyes of the imago are absolutely contiguous, the most that can be seen in the larva is a prolongation towards each other, and there are no ocelli. The legs are shorter and more fitted for crawling about water plants and on the bottom. In the mouth parts the mandibles and maxillæ are similar in form to those of the adult, but there is an extraordinary and unique modification of the lower lip. This is attached to an elongate and slender mentum articulated to the

FIG. 4.—The perfect insect (the wings having acquired their full dimensions) resting to dry itself, preparatory to the wings being horizontally extended.

posterior portion of the lower surface of the head, slightly widened at its extremity, to which is again articulated the labium proper, which is very large, flattened, and gradually dilated to its extremity; but its form differs according to group as in the perfect insect. Thus in the *Agriionidae* it is deeply cleft, and with comparatively slender side-pieces (or palpi), and strongly developed articulated spines; in the *Eschnidae* it is at the most notched, with narrow side-pieces and very strong spines; in the *Libellulidae* it is entire, often triangular at its apex, and with enormously developed palpi without spines, but having the opposing inner edges furnished with interlocking serrations. The whole of this apparatus is commonly termed the mask. In a state of repose it is applied closely against the face, the elongated mentum directed backward and lying between the anterior pair of legs; but when an approaching victim is seen the whole apparatus is suddenly projected, and the prey caught by the raptorial palpi; in some large species it is capable of being projected fully half an inch in front of the head. The prey, once caught and held by this apparatus, is devoured in the usual manner. There are two pairs of thoracic spiracles, but respiration is mostly affected by a peculiar apparatus at the tail end, and

there are two different methods. In the *Agrionidae* there are three elongate flattened plates, or false gills, full of tracheal ramifications, which extract the air from the water, and convey it to the internal tracheæ (in *Calopteryx* these plates are excessively long, nearly equalling the abdomen), the plates also serving as means of locomotion. But in the other groups these external false gills are absent, and in their place are five valves, which by their sudden opening and closing force in the water to the rectum, the walls of which are furnished with branchial lamellæ. The alternate opening and closing of these valves enables the creature to make quick jerks or rushes (incorrectly termed "leaps") through the water,¹ and, in conjunction with its mouth parts, to make sudden attacks upon prey from a considerable distance. The lateral angles of the terminal abdominal segments are sometimes produced into long curved spines. In colour these larvæ are generally muddy, and they frequently have a coating of muddy particles, and hence are less likely to be observed by their victims. If among insects the perfect dragon-fly may be termed the tyrant of the air, so may its larva be styled that of the water. Aquatic insects and larvæ form the principal food, but there can be no doubt that worms, the fry of fish, and even younger larvæ of their own species, form part of the bill of fare. The "nymph" when arrived at its full growth sallies forth from the water, and often crawls a considerable distance (frequently many feet up the trunks of trees) before it fixes itself for the final change, which is effected by the thorax splitting longitudinally down the back, through which fissure the perfect insect gradually drags itself. The figures on last page indicate this process as observed in *Eschna cyanea*.

For a considerable time after its emergence a dragon-fly is without any of its characteristic colours, and is flaccid and weak, the wings (even in those groups in which they are afterwards horizontally extended) being held vertically in a line with the abdomen. By degrees the parts harden, and the insect essays its first flight, but even then the wings have little power and are semi-opaque in appearance, as if dipped in mucilage. In most species of *Calopterygina*, and in some others, the prevailing colour of the body is a brilliant bronzy green, blue, or black, but the colours in the other groups vary much, and often differ in the sexes. Thus in *Libellula depressa* the abdomen of the fully adult male is covered with a bluish bloom, whereas that of the female is yellow; but several days elapse before this pulverulent appearance is attained, and a comparatively young male is yellow like the female. The wings are typically hyaline and colourless, but in many species (especially *Calopterygina* and *Libellulina*) they may be wholly or in part opaque and often black, due apparently to gradual oxydization of a pigment between the two membranes of which the wings are composed; the brilliant iridescence, or metallic lustre, so frequently found is no doubt due to interference—the effect of minute irregularities of the surface—and not produced by a pigment. A beautiful little genus (*Chalopteryx*) of *Calopterygina* from the Amazon is a gem in the world of insects, the posterior wings being of the most brilliant fiery metallic colour, whereas the anterior remain hyaline.

These insects are pre-eminently lovers of the hottest sunshine (a few are somewhat crepuscular), and the most powerful and daring on the wing in fine weather become inert and comparatively lifeless when at rest in dull weather, allowing themselves to be captured by the fingers without making any effort to escape. Many of the larger species (*Eschna*, &c.) have a habit of affecting a particular

twig or other resting place like a fly-catcher among birds, darting off after prey and making long excursions, but returning to the chosen spot. Mr Wallace, in his *Malay Archipelago*, states that the inhabitants of Lombok use the large species for food, and catch them by means of limed twigs.

They are distributed over the whole world excepting the polar regions, but are especially insects of the tropics. At the present day about 1700 species are known, dispersed unequally among the several sub-families as follows: *Agrionina*, 490 species; *Calopterygina*, 170; *Gomphina*, 210; *Eschnina*, 150; *Cordulina*, 100; *Libellulina*, 580. In Europe proper only 100 species have been observed, and about 46 of these occur in the British islands. New Zealand is excessively poor, and can only number 8 species, whereas they are very numerous in Australia. Some species are often seen at sea, far from land, in calm weather, in troops which are no doubt migratory; our common *Libellula quadrimaculata*, which inhabits the cold and temperate regions of the northern hemisphere, has been frequently seen in immense migratory swarms. One species (*Pantala flavescens*) has about the widest range of any insect, occurring in the Old World from Kamchatka to Australia, and in the New from the Southern States to Chili, also all over Africa and the Pacific islands, but is not found in Europe. The largest species occur in the *Eschnina* and *Agrionina*; a member of the former sub-family from Borneo expands to nearly 6½ inches, and with a moderately strong body and powerful form; in the latter the Central American and Brazilian *Megaloprepus cærulescens* and species of *Mecistogaster* are very large, the former expanding to nearly 7 inches, and the latter to nearly as much, but the abdomen is not thicker than an ordinary grass-stem and of extreme length (fully 5 inches in *Mecistogaster*). Among living entomologists the dragon-flies have received, and are receiving, great attention, especially from the Baron de Selys-Longchamps of Liège, and from Dr H. A. Hagen, formerly of Königsberg, now of Cambridge, Massachusetts.

It is impossible to prepare dragon-flies for the cabinet so as to retain all the brilliant colours the bodies have in life. They are excessively brittle when dry, and in the smaller species it is advisable to run a bristle into the under side of the thorax, pushing it down till it reach the extremity of the abdomen, when the other end can be cut off close to the thorax. But the larger species should be disembowelled through a slit along the under surface of the abdomen, and then filled (but not too tightly) with clean white cotton wool. The colours stand a much better chance of not greatly altering if the insects be not killed until some hours after they are captured, so as to allow the contents of the intestinal canal to be naturally passed away, for it is the decomposition of the food that assists materially to alter or obliterate the colour and markings.

Among fossil insects dragon-flies hold a conspicuous position. Not only do they belong to what appears to have been a very ancient type, but in addition, the large wings and strong dense reticulation are extremely favourable for preservation in a fossil condition, and in many cases all the intricate details can be as readily followed as in a recent example. In this country they have been found more especially in the Purbeck beds of Swanage, and the vales of Warton and Aylesbury, in the Stonesfield Slate series, and in the Lias and Rhætic series of the west of England. But the richest strata appear to be those of the Upper Miocene at Eningen, in the Rhine valley; the Middle Miocene at Radaboj, in Croatia; the Eocene of Aix, in Provence; and more especially the celebrated Secondary rocks furnishing the lithographic stone of Solenhofen, in Bavaria. This latter deposit would appear to have been of marine origin,

¹ A similar contrivance was suggested and (if the writer mistakes not) actually tried as a means of propelling steam-ships.

and it is significant that, although the remains of gigantic dragon-flies discovered in it are very numerous and perfect, no traces of their sub-aquatic conditions have been found, although these as a rule are numerous in most of the other strata, hence the insects may be regarded as having been drowned in the sea and washed on shore. Many of these Solenhofen species differ considerably in form from those now existing, so that Dr Hagen, who has especially studied them, says that for nearly all it is necessary to make new genera. A notice of fossil forms should not be concluded without the remark that indications of at least two species have been found in amber, a number disproportionately small if compared with other insects entombed therein; but it must be remembered that a dragon-fly is, as a rule, an insect of great power, and in all probability those then existing were able to extricate themselves if accidentally entangled in the resin.

See De Selys-Longchamps, *Monographie des Libellulides d'Europe*, Brussels, 1840; *Synopsis des Agrionines, Calopterygines, Gomphines, et Cordulines*, with Supplements, Brussels, from 1858 to 1877; De Selys-Longchamps and Hagen, *Revue des Odonates d'Europe*, Brussels, 1850; *Monographie des Calopterygines et des Gomphines*, Brussels, 1854 and 1858; Charpentier, *Libellulinae europææ*, Leipzig, 1840 (R. M. L.)

DRAGON'S BLOOD, a name applied to the resins obtained from several species of plants. *Calamus Draco* (Willd.), one of the Rotang or Rattan Palms, which produces much of the dragon's blood of commerce, is a native of Further India and the Eastern Archipelago. When young it grows erect, but with age it becomes climbing. The leaves are pointed, about a foot long, of a finger's breadth, and, like the stems, armed with spines. The flower has a three-cleft corolla, and the ovary is egg-shaped. The fruit is round, pointed, scaly, and the size of a large cherry, and when ripe is coated with the resinous exudation known as dragon's blood. The finest dragon's blood, called *jernang* or *djernang* in the East Indies, is obtained by beating or shaking the gathered fruits, sifting out impurities, and melting by exposure to the heat of the sun or by placing in boiling water; the resin thus purified is then usually moulded into sticks or quills (the *sanguis draconis in baculis* of pharmacy), and wrapped in reeds or palm-leaves, and is then ready for market. An impurer and inferior kind, sold in lumps of considerable size (*sanguis draconis in massis*), is extracted from the fruits by boiling. Dragon's blood is dark red-brown, nearly opaque, and brittle, contains small shell-like flakes, and gives when ground a fine red powder; it is soluble in alcohol, ether, and fixed and volatile oils, and in the pure condition has, according to F. W. Johnston (*Phil. Trans*, 1839, p. 134), the composition $C_{20}H_{21}O_4$. If heated it gives off fumes of benzoic acid. In Europe it was once valued as a medicine on account of its astringent properties, and is now used for colouring plasters, dentrifice, and varnishes; in China, where it is mostly consumed, it is employed to give a red facing to writing paper. The drop dragon's blood of commerce, called *cinnabar* by Pliny (*N. H.* xxxiii. 39), and *sangre de dragon* by Barbosa, was formerly and is still one of the products of Socotra, the *Dioscoridis insula* of ancient geographers; it was known to the Arabs by the term *kâtir*, from which the name of the island may have been derived (see A. Sprengel, *Alte Geographie Arabiens*, 1875). It is the spontaneous exudation of a leguminous tree, *Pterocarpus Draco*, which grows at elevations between 800 and 2000 feet above sea-level (see Wellsted, *Journ. R. Geog. Soc.*, 1835, p. 198). Jacquin states (*Select Stirpium Amer. Hist.*, p. 283, 1763) that the tree grows in the woods of Tierra Bomba, off Cartagena, in Colombia, and that dragon's blood, obtained from it by incision, was at one time imported into Spain for medicinal purposes. The dragon's blood of the Canary Islands is a tonic and astringent resin procured from the surface of the leaves

and from cracks in the trunk of *Dracæna Draco*, a tree of the natural order *Liliacææ*. The hardened juice of a euphorbiaceous tree, *Croton Draco*, a resin resembling kino, is the *sangre del drago* or dragon's blood of the Mexicans, used by them as a vulnerary and astringent.

Rumphius, *Herbarium Ambouense*, p. v. 114-119, tab. lvm., 1747; Flückiger and Hanbury, *Pharmacographia*, 1874

DRAGUIGNAN, the chief town of the department of Var, in France, and of an arrondissement of the same name, on the River Pis, a branch of the Nartuby, lies at the foot of the wooded height of Malmont, in 43° 32' 18" N. lat. and 6° 27' 56" E. long. The préfecture, palace of justice, theatre, hospital, and prison are the most important public buildings. The town possesses a communal college, a training school for teachers, a botanical garden, a fine promenade, a library of about 18,000 volumes, collections of coins, pictures, and natural history objects, and an archæological society. The inhabitants, who in 1872 numbered 8177, are engaged in agriculture and the manufacture of wine, coarse cloth, earthenware, silk, soap, candles, oil, brandy, copper wares, and leather.

DRAINAGE. See AGRICULTURE, ARCHITECTURE, BUILDING, and SEWAGE.

DRAKE, SIR FRANCIS (c. 1545-1595), a celebrated English admiral, was born near Tavistock, Devonshire, about 1545 according to most authorities, but Barrow, in his life, says the date may have been as early as 1539. His father, a yeoman and a zealous Protestant, was obliged to take refuge in Kent during the persecutions in the reign of Queen Mary. He obtained a naval chaplaincy from Queen Elizabeth, and is said to have been afterwards vicar of Upnor Church, on the Medway. Thus, however, must be a mistake, as there is no evidence of any church ever having existed at Upnor. Young Drake was educated at the expense and under the care of Sir John Hawkins, who was his kinsman, and, after passing an apprenticeship on a coasting vessel, at the age of eighteen he had risen to be purser of a ship trading to Biscay. At twenty he made a voyage to Guinea; and at twenty-two he was made captain of the "Judith." In that capacity he was in the harbour of San Juan de Ulloa, in the Gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England, having acquired great reputation, though with the loss of all the money which he had embarked in the expedition. In 1570 he obtained a regular privateering commission from Queen Elizabeth, the powers of which he immediately exercised in a cruise in the Spanish Main. Having next projected an attack against the Spaniards in the West Indies to indemnify himself for his former losses, he set sail in 1572, with two small ships named the "Pasha" and the "Swan." He was afterwards joined by another vessel; and with this small squadron he took and plundered the Spanish town of Nombre de Dios. With his men he penetrated across the isthmus of Panama, and committed great havoc among the Spanish shipping. From the top of a tree which he climbed while on the isthmus he obtained his first view of the Pacific, and resolved "to sail an English ship in these seas." In these expeditions he was much assisted by a tribe of Indians, who were then engaged in a desultory warfare with the Spaniards. Having embarked his men and filled his ships with plunder, he bore away for England, and arrived at Plymouth on the 9th August 1573.

His success and honourable demeanour in this expedition gained him high reputation, and the use which he made of his riches served to raise him still higher in popular esteem. Having fitted out three frigates at his own expense, he sailed with them to Ireland, and rendered effective service as a volunteer, under Walter earl of Essex, the father of the famous but unfortunate earl. After the death of his

patron he returned to England, where Sir Christopher Hatton introduced him to Queen Elizabeth, and procured him a favourable reception at court. In this way he acquired the means of undertaking that grand expedition which has immortalized his name. The first proposal he made was to undertake a voyage into the South Seas through the Straits of Magellan, which no Englishman had hitherto ever attempted. This project having been well received at court, the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed on this enterprise consisted of only five small vessels, and their united crews mustered only 166 men. Having sailed on the 13th December 1577, he on the 25th made the coast of Barbary, and on the 29th Cape Verd. He reached the coast of Brazil on the 5th of April, and entered the Rio de la Plata, where he parted company with two of his ships; but having met them again, and taken out their provisions, he turned them adrift. On the 29th May he entered the port of St Julian's, where he continued two months for the sake of laying in a stock of provisions. On the 20th August he entered the Straits of Magellan, and on the 25th September passed them, having then only his own ship. On the 25th November he arrived at Macao, which he had appointed as the place of rendezvous in the event of his ships being separated; but Captain Winter, his vice-admiral, had repassed the straits and returned to England. He thence continued his voyage along the coast of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were satiated with plunder; and then coasted along the shores of America, as far as 48° N. lat., in an unsuccessful endeavour to discover a passage into the Atlantic. Having landed, however, he named the country New Albion, and took possession of it in the name of Queen Elizabeth. Having careened his ship, he sailed thence on the 29th September 1579 for the Moluccas. On the 4th November he got sight of those islands, and, arriving at Ternate, was extremely well received by the king. On the 10th December he made the Celebes, where his ship unfortunately struck upon a rock, but was taken off without much damage. On the 16th March he arrived at Java, whence he intended to have directed his course to Malacca; but he found himself obliged to alter his purpose, and to think of returning home. On the 25th March 1580 he again set sail; and on the 15th June he doubled the Cape of Good Hope, having then on board only fifty-seven men and three casks of water. He passed the line on the 12th July, and on the 16th reached the coast of Guinea, where he watered. On the 11th September he made the Island of Terceira, and on the 3d November he entered the harbour of Plymouth. This voyage round the world, the first accomplished by an Englishman, was thus performed in two years and about ten months. The queen hesitated for some time whether to recognize his achievements or not, on the ground that such recognition might lead to complications with Spain, but she finally decided in his favour. Accordingly, soon after his arrival she paid a visit to Deptford, went on board his ship, and there, after partaking of a banquet, conferred upon him the honour of knighthood, at the same time declaring her entire approbation of all that he had done. She likewise gave directions for the preservation of his ship, the "Golden Hind," that it might remain a monument of his own and his country's glory. After the lapse of a century it decayed and had to be broken up. Of the sound timber a chair was made, which was presented by Charles II. to the university of Oxford. In 1585, open hostilities having commenced with Spain, Drake sailed with a fleet to the West Indies, and took the cities of St Jago, St Domingo, Cartagena, and St Augustine. In 1587 he went to Lisbon with a fleet of thirty sail; and

having received intelligence of a great fleet being assembled in the bay of Cadiz, and destined to form part of the Armada, he with great courage entered the port on the 19th April, and there burnt upwards of 10,000 tons of shipping,—a feat which he afterwards jocosely called "singeing the king of Spain's beard." In 1588, when the Spanish Armada was approaching England, Sir Francis Drake was appointed vice-admiral under Lord Howard, and made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of the invasion, and who struck at once on learning his adversary's name.

It deserves to be noticed that Drake's name is mentioned in the singular diplomatic communication from the king of Spain which preceded the Armada:—

Te veto ne pergas bello defendere Belgas;
Quæ Dræus eripuit nunc restituantur oportet;
Quas pater everit jubeo te condere cellas:
Religio Papæ fac restituatur ad unguem.

To these lines the queen made this extempore response:—

Ad Græcas, bone rex, fiant mandata kalendas

In 1589 Drake commanded the fleet sent to restore Dom Antonio, king of Portugal, the land forces being under the orders of Sir John Norris; but they had hardly put to sea when the commanders differed, and thus the attempt proved abortive. But as the war with Spain continued, a more formidable expedition was fitted out, under Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been undertaken during the whole course of it. Here, however, the commanders again disagreed about the plan, and the result in like manner disappointed public expectation. These disasters were keenly felt by Drake, and were the principal cause of his death, which took place on board his own ship, near the town of Nombre de Dios, in the West Indies, January 23, 1595.

See Lives of Drake by Samuel Clarke (1671) and John Barrow, junr. (1843)

DRAKENBORCH, ARNOLD (1684–1748), a celebrated scholar and editor, was born at Utrecht on the 1st January 1684. Having studied belles-lettres under Grævius and Burmann, and law under Cornelius Van Eck, he succeeded Professor Burmann in 1716, and continued to hold his professorship till his death in 1748, in the sixty-fourth year of his age. His earliest work was a dissertation entitled *Disputatio philologico-historico de Præfectis urbis*, in 4to (1704), and its merit caused it to be reprinted at Frankfurt, in 1752, by Professor Uhl, accompanied with a life of its learned author. His next work, entitled *Disputatio de officio præfectorum prætorio*, was published in 1707; and ten years afterwards he issued his edition of Silius Italicus (1717), undertaken at the suggestion of Burmann. In order to render this edition as perfect as possible, nothing was omitted, and many historical subjects were engraved for the purpose of elucidating the text, to which his own copious and learned annotations greatly contributed. But his splendid edition of Livy (Lugd. Batav. 1738 and 1746, 7 vols.), with a life of that historian, is that on which his fame as a scholar chiefly rests. The preface to this work is replete with erudition, and gives a particular account of all the literary men who have at different periods commented on the works of Livy. His edition is based on that of Gronovius; but he made many important alterations on the authority of manuscripts which it is probable Gronovius either had never seen, or had not taken the pains to consult. The edition is peculiarly rich in various readings, but the text is, of course, inferior to that which has been furnished by the skill of later editors. Upon the whole, this edition of Livy was, at the time of its publication, one of the most elaborate, interesting, and instructive that had ever been given to the world.

D R A M A

DRAMA (from δράω) signifies action. The term is applied to compositions which imitate action by representing the personages introduced in them as real and as employed in the action itself. The varieties of the drama differ more or less widely, both as to the objects imitated and as to the means used in the imitation. But they all agree as to the *method* or *manner* which is essential to the dramatic art, viz., *imitation in the way of action*.

The desire to give expression to feelings and conceptions is inseparable from human nature. Man expresses his thoughts and emotions by gesture and by speech, or by a combination of both; and these expressions he soon learns in the society of other men—and more especially on joyous or solemn occasions—to vary or regulate in dance and song. Another way of expression, often combined with the other, is imitation. To imitate, says Aristotle, is instinctive in man from his infancy; and from imitation all men naturally receive pleasure. Gesture and voice are means of imitation common to all human beings; and the aid of some sort of dress and decoration is generally within the reach of children, and of the childhood of nations. The assumption of character, whether real or fictitious, is therefore the earliest step towards the drama. But it is only a preliminary step; nor is the drama itself reached till the imitation extends to action.

Action, which man is not wont to attribute (except figuratively) to any but members of his own species and to the superior Being or beings in whose existence and power he believes, implies an operation of the will and an execution of its resolution, whether or not amounting to a fulfilment of its purpose. It implies a procedure from cause to result. Action must therefore present itself to the human mind as having its source in a human or superhuman will. Every imitation of action by action is in germ a drama. But to this point not all nations have advanced.

After this step has been taken, it only remains for the drama to assume a form regulated by literature, of which art it thus becomes a branch. We may then speak of a dramatic literature; but this only a limited number of nations has come to possess. A nation may, however, have a drama without a dramatic literature; it may even continue in possession of the former after having ceased to cultivate the latter. On the other hand, both before and after the drama of a nation has assumed a literary form, it may allow one or more of its adventitious elements—music, dancing, decoration—predominantly to assert themselves, and thus eventually to bring about the formation of new, or the revival of disused, dramatic species. But as a branch of literature the drama necessarily includes speech among its means of imitation; and its beginnings as such are accordingly, in the history of all literatures known to us, preceded by the beginnings at least of other forms of poetic composition, the lyric and the epic, or by those of one of these forms at all events. It is in the combination of both that the drama in its literary form takes its origin in the case of all national civilizations in which it has found a place and with which we are more than superficially acquainted.

The art of acting is the indispensable adjunct of the dramatic art, while the aid of all other arts is merely an accident. But though really inseparable from one another, the courses of the dramatic and the histrionic arts do not at all times run parallel. The actor is only the temporary interpreter of the dramatist, though he may occasionally be left to supply some of the proper functions of his text-giver. On his side, the dramatist may in practice, though

he cannot in theory, dispense with the actor's interpretation; but though the term literary drama is sometimes used of works kept apart from the stage, it is in truth a misnomer, since, properly speaking, no drama is such till it is acted.

The whole body of the laws and rules of the drama, Laws could it be written down with completeness, would rules indicate, together with the ends proper to the art, the means by which it is able to accomplish them. But neither the great authorities of dramatic theory—an Aristotle or a Lessing—nor the resolute apologists of more or less transitory fashions—a Corneille or a Dryden—have exhausted the exposition of the means which the drama has proved or may prove capable of employing. The multitude of technical terms and formulæ which has gathered round the practice of the art has at no time seriously interfered with the operation of creative power, whose inventive activity the existence of, accepted systems has frequently—in the Greek drama, for instance, and in the Spanish—served to stimulate. On the other hand, it is self-evident that no dramaturgic theory has ever given rise to a single dramatic work of enduring value, unless the creative force was there to animate the form.

The task of this creative force begins with the beginnings Subj. of the dramatist's labours. For it is in the dramatic *idea*, idea, that the germ of the action of a play lies—not in the action subject, which is merely its dead material. The story of the Scottish thane as it stood written in the chronicle, is the subject, not the action, of *Macbeth*. To convert a subject—whatever its kind or source—into the action or fable of a play is the primary task, which in its progressive development becomes the entire task, of the dramatist; and though the conception may expand or modify itself with the execution, yet upon the former the latter depends. The range of subjects open to a dramatist may be wide as the world itself, or it may be limited by usage, by imperious fashion, by the tastes and tendencies of a nation or an age, by the author's own range of sympathies, by a thousand restrictions of an historical, moral, or æsthetical origin; it may be virtually confined (as with the earlier Greek tragedians) to a body of legend, or (as with the English comedians of the Restoration) to the social experiences of a particular epoch. But in all cases the transformation of the subject into the action is equally indispensable, and an imperfect transformation is (as in the old Chronicle Histories) the work of a rude, or (as in ninety-nine out of a hundred modern plays "founded upon fact") that of a careless method of dramatic production.

What, then, are the laws which determine the nature of Unl. all actions properly such, however they may vary either in act. subjects or in form? In the first place, a dramatic action must possess *unity*—and this requirement at once distinguishes it from the subject which has suggested its idea. The events of real life, the facts of history, the incidents of narrative fiction, are like the waves of a ceaseless flood; that which binds a group or body of them into a single action is the bond of the dramatic idea, and this it is which the dramatist has to supply. Within the limits of a dramatic action all its parts claim to be connected together as contributions to a single stream; and upon the degree in which they are true to this purpose their primary dramatic significance depends. The unity of action which a drama should possess, therefore, means that everything in it should form a link in a single chain of cause and effect. This law is incumbent upon every kind of drama—alike upon the tragedy which solves the problems of a life,

and upon the farce which sums up the follies of an afternoon.

Such is not, however, the case with certain rules which have at different times been set up for this or that kind of drama, but which have no absolute validity for any kind. The supposed necessity that an action should consist of *one event* is an erroneous interpretation of the law that it should be, as an action, *one*. For an event is but an element in an action, though it may be an element of decisive moment. The assassination of Cæsar is not the action of a *Cæsar* tragedy, the loss of his treasure is not the action of *The Miser*. Again, unity of action does not exclude the introduction of one or even more subsidiary actions as contributing to the progress of the main action. The sole indispensable law is that these should always be treated as what they are—subsidiary only, and herein lies the difficulty, which Shakespeare so successfully overcame, of solving a combination of subjects into the idea of a single action, herein also lies the danger in the use of that favourite device of the modern drama—*by-* or *under-plots*. On the other hand, a really double or multiple action, logically carried out as such, is inconceivable in a single drama, though there is many a play which is palpably only two plays knotted into one. Every one is familiar with the dramatist who towards the drop of the curtain seems to be counting on his fingers whom he has killed or what couples he has to marry. Thirdly, unity of action need not imply unity of hero—for hero (or heroine) is merely a term signifying the principal personage of the action. And inasmuch as an action may consist in the joint contention of more than one will against the same obstacle—as in the instance of *The Seven against Thebes*, or *Romeo and Juliet*—it is only when the change in the degree of interest excited by different characters in a play results from a change in the conception of the action itself, that the consequent *duality* (or multiplicity) of heroes recalls a faulty uncertainty in the conception of the action they carry on. Such is the objection applying to the crucial case of Schiller's *Don Carlos*. Lastly, the entirely arbitrary exactions of *unity of time* and of *place* are not, like that of unity of action, absolute dramatic laws. Their object is by representing an action as visibly continuous to render its unity more distinctly or easily perceptible; but the effect of their observance cannot be to render it more really *one*. Thus they may in one sense be regarded as devices to avoid the difficulty experienced by the human mind in regarding an action as *one* when the eye beholds its different parts occurring in what are supposed to be different places, or when the process of its advance from cause to effect extends over what is supposed to be a considerable period of time. But the imagination is capable of constructing for itself the bridges necessary to preserve to an action, conceived of as such, its character of continuousness. In another sense these rules were convenient usages conducing to a concise and clear treatment as actions of subjects in themselves of a limited nature; for they were a Greek invention, and the repeated resort to the same group of myths made it expedient for a Greek poet to seek the subject of a single tragedy in a part only of one of the myths open to him. The observance of unity of place, moreover, was suggested to the Greeks by certain outward conditions of their stage—as assuredly as it was adopted by the French in accordance with the construction and usages of theirs, and as the neglect of it by the Elizabethans was in their case encouraged by the established form of the English scene. The palpable artificiality of these laws needs no demonstration, so long as the true meaning of the term action be kept in view. Of the *action* of *Othello* part takes place at Venice and part at Cyprus, and yet the whole is one in itself; while the limits of time

over which an action extends cannot be restricted by a revolution of the earth round the sun, or of the moon round the earth.

In a drama which presents its action as *one*, this action must be *complete in itself*. This law, like the first, distinguishes the dramatic action from its subject. The former may be said to have a real artistic, while the latter has only an imaginary real, completeness. The historian, for instance, aims indeed at a complete exposition of a body of events and transactions, and may even design to show their working to a definite end; but he is aware that this aim can never be more than partially accomplished, since he may present only what he knows, and all human knowledge is partial. But art is limited by no such uncertainty. The dramatist, in treating an action as *one*, comprehends the whole of it in the form of his work, since to him who has *conceived* it, all its parts, from cause to effect, are equally clear. Accordingly, every drama should represent in organic sequence the several stages of which a complete action consists, and which are essential to it. This law of completeness therefore lies at the foundation of all systems of dramatic construction.

Every action, if conceived of as complete, has its causes, growth, height, consequences, and close. There is no binding law to prescribe the relative length at which these several stages in the action should be treated in a drama, or to enforce a more or less exact correspondence between the successive presentment of each, and technical divisions, such as acts or scenes, which dramatic practice may find it convenient to adopt. Neither is there any law to assert any obligatory regulation of the treatment of such subsidiary actions as may be introduced in aid of the main plot, or of such more or less directly connected *episodes* which may at the same time advance and relieve its progress. But experience, as the parent of usage, has necessarily from time to time established certain rules of practice, from which the dramatist, working under customary forms, will find it neither easy, nor in most cases advantageous, to swerve too widely; and from the adoption of particular systems of division for particular species of the drama—such as that into five acts for a regular tragedy or comedy, which Roman example has caused to be so largely followed—has naturally resulted a certain uniformity of relation between the conduct of an action and the outward sections of a play. Essentially, however, there is no difference between the laws regulating the construction of a Sophoclean or Shakespearean tragedy, a comedy of Molière or Congreve, and a well-built modern farce. And this, because all exhibit an action complete in itself.

The *introduction* or *exposition* forms an integral part of the action, and is therefore to be distinguished from the *prologue* in the more ordinary sense of the term, which, like the *epilogue* (or the Greek *parabasis*), stands outside the action, and is a mere address to the public from author or actor occasioned by the play. Prologue and epilogue, greatly as they may have at times contributed to the success of a drama, are mere external adjuncts, and have as little to do with the construction of a play as the bill which announces it, or the musical prelude which disposes the mind for its reception. The introduction or exposition belongs to the action itself; it is, as the Hindu critics called it, the seed or circumstance from which the business arises. Clearness being its primary requisite, many expedients have been at various times adopted to secure this feature. Thus, the Euripidean prologue, though spoken by one of the characters of the play, takes a narrative form, and places itself half without, half within the action of which it properly is part. The same purpose is served by the separate introductions in many of our old English plays, and the preludes or prologues, or by whatever name they may call

Complete

tion or
exposition

themselves, in numberless modern dramas of all kinds—from *Faust* down to the favourites of the Ambigu and the Adelphi. Another such expedient is that of the inductive dumb-shows, which sought to secure rapidity together with impressiveness of exposition by the process of pantomimic summary. Such, again, are the opening scenes in French tragedy between hero and *confidant*, and those in French comedy and its derivatives between observant valet and knowing lady's-maid. But it is clear how all such expedients may be rendered unnecessary by the art of the dramatist, who is able outwardly also to present the introduction of his action as what it is—an organic part of that action itself; who seems to take the spectators *in medias res* while he is really building the foundations of his plot; who can dramatically account for an Iliad of woes without going back to Leda's egg; who touches in the opening of his action the chord which is to vibrate throughout its course—"Down with the Capulets! down with the Montagues!"—"With the Moor, sayest thou?"

The introduction ends with the opening of the movement of the action, a passage which it may prove highly effective to mark with the utmost distinctness (as in *Hamlet*, where it is clearly to be sought in the actual meeting between the hero and the ghost), but which in other instances is advantageously marked by the insertion of subsidiary action or episode (as in *King Lear*, where the opening of the movement of the main action would follow too sharply upon its exposition, were not the beginning of the subsidiary action of Gloster and his sons opportunely introduced between them). From this point the second stage of the action—its *growth*—progresses to that third stage which is called its *height* or *climax*. All that has preceded the reaching of this constitutes that half of the drama—usually its much larger half—which Aristotle terms the *δέσις*, or tying of the knot. The varieties in the treatment of the growth or second stage of the action are infinite, and it is here that the masters of the tragic and the comic drama—notably those unequalled weavers of intrigues, the Spaniards—are able most fully to exercise their *inventive* faculties. If the growth is too rapid, the climax will fail of its effect—and it is, therefore, at this stage that subsidiary actions and episodes are most largely used; if it is too slow, the interest will be exhausted before the greatest demand upon it has been made—a fault to which comedy is specially liable; if it is involved or inverted, a vague uncertainty will take the place of an eager or agreeable suspense, the action will seem to halt, or a fall will begin prematurely. In the contrivance of the *climax* itself lies one of the chief tests of the dramatist's art; for while in the transactions of real life their climax is often only a matter of assumption, in the action of a drama its climax should present itself as self-evident. In the middle of everything, says the Greek poet, lies the strength; and this strongest or highest point it is the task of the dramatist to make manifest. Much here depends upon the niceties of constructive instinct; much (as in all parts of the action) upon a thorough dramatic transformation of the subject. The historical drama here presents peculiar difficulties, and perhaps the example of *Henry VIII.*, as compared with Shakespeare's other historical plays, may be held to furnish an instructive example of defective (because hasty) workmanship.

From the climax, or height, the action proceeds through its *fall* to its *close*, which in a drama with an unhappy ending we still call its *catastrophe*, while to terminations in general we apply the term *dénouement*. This latter name would, however, more properly be used in the sense in which Aristotle employs its Greek equivalent *λύσις*—the untying of the knot—of the whole of the second part of the action, from the climax downwards. If, in the management of the climax, everything depended upon making the

effect, in the fall everything depends upon not marring it. This may be ensured by a rapid progress to the close; but neither does every action admit of such treatment, nor is it in accordance with the character of those actions which are of a complicated kind. With the latter, therefore, the *fall* is often a *return*—i.e., in Aristotle's phrase, a change into the reverse of what is expected from the circumstances of the action (*περιέκτα*),—as in *Coriolanus*, where the Roman story lends itself so admirably to dramatic demands. In any case the art of the dramatist is in this part of his work called upon for the surest exercise of its tact and skill. The effect of the climax has been to concentrate the interest; the fall must therefore, above all, avoid dissipating it. The use of episodes is not even now excluded; but they must be of a more directly significant kind than is necessary in the earlier stages of the drama; even where serving the purpose of relief they must help to keep alive the interest previously raised to its highest pitch. This may be effected by a return or revolution; or again, by the raising of obstacles between the height of the action and its expected consequences, by the suggestion in tragedy of a seemingly possible recovery or escape from them (as in the wonderfully powerful construction of the latter part of *Macbeth*), by the gradual removal in comedy, or wherever the interest of the action is less intense, of such difficulties as the growth and climax have occasioned. In all kinds of the drama *discovery* will remain, as it was in the judgment of Aristotle, a most effective expedient; but it should be a discovery which has been foreshadowed by that method of treatment which in its consummate master, Sophocles, has been termed his *irony*. Nowhere should the close or catastrophe be other than a consequence of the action itself. Sudden revulsions from the conditions of the action—such as the *deus ex machina*, or the revising officer of the emperor of China, or the nabob returned from India bring about—condemn themselves as unsatisfactory makeshifts. However sudden, and even, in manner of accomplishment, surprising, may be the catastrophe, it should not be unprepared, but like every other part of the action should preserve its organic connection with the whole. The sudden suicides which terminate so many tragedies, and the paternal blessings which close an equal number of comedies, should be something more than a signal for the fall of the curtain.

The action of a drama, besides being one and complete in itself, ought likewise to be *probable*. The probability required of a drama is not that of actual or historical experience—it is a conditional probability, or in other words the consistency of the course of the action with the conditions under which, and with the characters by which, the dramatist has chosen to carry it on. As to the former, he is fettered by no restrictions save those which he imposes upon himself, whether or not in deference to the usages of certain accepted species of dramatic composition. Ghosts appear neither in real life nor in dramas of real life; but the introduction of supernatural agency is neither enjoined nor prohibited by any general dramatic law. The use of such expedients is as open to the dramatic as to any other poet; the judiciousness of his use of them depends upon the effect which, consistently with the general conduct of his action, they will exercise upon the spectator, whom other circumstances may or may not predispose to their acceptance. The ghost in *Hamlet* belongs to the action of the play; the ghost in the *Perse* is not intrinsically less probable, but the apparition seems to spring, so to speak, less naturally out of the atmosphere around it. Dramatic probability has, however, a far deeper meaning than this. The *Eumenides* is probable with all its primitive mysteriousness, and *Macbeth* with all its barbarous witchcraft. The proceedings of the feathered builders of Cloudeuckootown

and upon the farce which sums up the follies of an afternoon.

Such is not, however, the case with certain rules which have at different times been set up for this or that kind of drama, but which have no absolute validity for any kind. The supposed necessity that an action should consist of *one event* is an erroneous interpretation of the law that it should be, as an action, *one*. For an event is but an element in an action, though it may be an element of decisive moment. The assassination of Cæsar is not the action of a *Cæsar* tragedy; the loss of his treasure is not the action of *The Miser*. Again, unity of action does not exclude the introduction of one or even more subsidiary actions as contributing to the progress of the main action. The sole indispensable law is that these should always be treated as what they are—subsidiary only, and herein lies the difficulty, which Shakespeare so successfully overcame, of solving a combination of subjects into the idea of a single action; herein also lies the danger in the use of that favourite device of the modern drama—*by-* or *under-plots*. On the other hand, a really double or multiple action, logically carried out as such, is inconceivable in a single drama, though there is many a play which is palpably only two plays knotted into one. Every one is familiar with the dramatist who towards the drop of the curtain seems to be counting on his fingers whom he has killed or what couples he has to marry. Thirdly, unity of action need not imply unity of hero—for hero (or heroine) is merely a term signifying the principal personage of the action. And inasmuch as an action may consist in the joint contention of more than one will against the same obstacle—as in the instance of *The Seven against Thebes*, or *Romeo and Juliet*—it is only when the change in the degree of interest excited by different characters in a play results from a change in the conception of the action itself, that the consequent *duality* (or multiplicity) of heroes recalls a faulty uncertainty in the conception of the action they carry on. Such is the objection applying to the crucial case of Schiller's *Don Carlos*. Lastly, the entirely arbitrary exactions of *unity of time* and *of place* are not, like that of unity of action, absolute dramatic laws. Their object is by representing an action as visibly continuous to render its unity more distinctly or easily perceptible; but the effect of their observance cannot be to render it more really *one*. Thus they may in one sense be regarded as devices to avoid the difficulty experienced by the human mind in regarding an action as *one* when the eye beholds its different parts occurring in what are supposed to be different places, or when the process of its advance from cause to effect extends over what is supposed to be a considerable period of time. But the imagination is capable of constructing for itself the bridges necessary to preserve to an action, conceived of as such, its character of continuousness. In another sense these rules were convenient usages condescending to a concise and clear treatment as actions of subjects in themselves of a limited nature; for they were a Greek invention, and the repeated resort to the same group of myths made it expedient for a Greek poet to seek the subject of a single tragedy in a part only of one of the myths open to him. The observance of unity of place, moreover, was suggested to the Greeks by certain outward conditions of their stage—as assuredly as it was adopted by the French in accordance with the construction and usages of theirs, and as the neglect of it by the Elizabethans was in their case encouraged by the established form of the English scene. The palpable artificiality of these laws needs no demonstration, so long as the true meaning of the term action be kept in view. Of the *action* of *Othello* part takes place at Venice and part at Cyprus, and yet the whole is one in itself; while the limits of time

over which an action extends cannot be restricted by a revolution of the earth round the sun, or of the moon round the earth.

In a drama which presents its action as *one*, this action must be *complete in itself*. This law, like the first, distinguishes the dramatic action from its subject. The former may be said to have a real artistic, while the latter has only an imaginary real, completeness. The historian, for instance, aims indeed at a complete exposition of a body of events and transactions, and may even design to show their working to a definite end; but he is aware that this aim can never be more than partially accomplished, since he may present only what he knows, and all human knowledge is partial. But art is limited by no such uncertainty. The dramatist, in treating an action as *one*, comprehends the whole of it in the form of his work, since to him who has *conceived* it, all its parts, from cause to effect, are equally clear. Accordingly, every drama should represent in organic sequence the several stages of which a complete action consists, and which are essential to it. This law of completeness therefore lies at the foundation of all systems of dramatic construction.

Every action, if conceived of as complete, has its causes, growth, height, consequences, and close. There is no binding law to prescribe the relative length at which these several stages in the action should be treated in a drama, or to enforce a more or less exact correspondence between the successive presentment of each, and technical divisions, such as acts or scenes, which dramatic practice may find it convenient to adopt. Neither is there any law to assert any obligatory regulation of the treatment of such subsidiary actions as may be introduced in aid of the main plot, or of such more or less directly connected *episodes* which may at the same time advance and relieve its progress. But experience, as the parent of usage, has necessarily from time to time established certain rules of practice, from which the dramatist, working under customary forms, will find it neither easy, nor in most cases advantageous, to swerve too widely; and from the adoption of particular systems of division for particular species of the drama—such as that into five acts for a regular tragedy or comedy, which Roman example has caused to be so largely followed—has naturally resulted a certain uniformity of relation between the conduct of an action and the outward sections of a play. Essentially, however, there is no difference between the laws regulating the construction of a Sophoclean or Shakespearean tragedy, a comedy of Molière or Congreve, and a well-built modern farce. And this, because all exhibit an action complete in itself.

The *introduction* or *exposition* forms an integral part of the action, and is therefore to be distinguished from the *prologue* in the more ordinary sense of the term, which, like the *epilogue* (or the Greek *parabasis*), stands outside the action, and is a mere address to the public from author or actor occasioned by the play. Prologue and epilogue, greatly as they may have at times contributed to the success of a drama, are mere external adjuncts, and have as little to do with the construction of a play as the bill which announces it, or the musical prelude which disposes the mind for its reception. The introduction or exposition belongs to the action itself; it is, as the Hindu critics called it, the seed or circumstance from which the business arises. Clearness being its primary requisite, many expedients have been at various times adopted to secure this feature. Thus, the Euripidean prologue, though spoken by one of the characters of the play, takes a narrative form, and places itself half without, half within the action of which it properly is part. The same purpose is served by the separate inductions in many of our old English plays, and the preludes or prologues, or by whatever name they may call

Complete-
ness of
action.

tion or
exposition

themselves, in numberless modern dramas of all kinds—from *Faust* down to the favourites of the Ambigu and the Adelphi. Another such expedient is that of the inductive dumb-shows, which sought to secure rapidity together with impressiveness of exposition by the process of pantomimic summary. Such, again, are the opening scenes in French tragedy between hero and *confidant*, and those in French comedy and its derivatives between observant valet and knowing lady's-maid. But it is clear how all such expedients may be rendered unnecessary by the art of the dramatist, who is able outwardly also to present the introduction of his action as what it is—an organic part of that action itself; who seems to take the spectators *in medias res* while he is really building the foundations of his plot; who can dramatically account for an *Iliad* of woes without going back to Leda's egg; who touches in the opening of his action the chord which is to vibrate throughout its course—"Down with the Capulets! down with the Montagues!"—"With the Moor, sayest thou?"

The introduction ends with the opening of the movement of the action, a passage which it may prove highly effective to mark with the utmost distinctness (as in *Hamlet*, where it is clearly to be sought in the actual meeting between the hero and the ghost), but which in other instances is advantageously marked by the insertion of subsidiary action or episode (as in *King Lear*, where the opening of the movement of the main action would follow too sharply upon its exposition, were not the beginning of the subsidiary action of Gloster and his sons opportunely introduced between them). From this point the second stage of the action—its *growth*—progresses to that third stage which is called its *height* or *climax*. All that has preceded the reaching of this constitutes that half of the drama—usually its much larger half—which Aristotle terms the *deûsis*, or tying of the knot. The varieties in the treatment of the growth or second stage of the action are infinite, and it is here that the masters of the tragic and the comic drama—notably those unequalled weavers of intrigues, the Spaniards—are able most fully to exercise their *inventive* faculties. If the growth is too rapid, the climax will fail of its effect—and it is, therefore, at this stage that subsidiary actions and episodes are most largely used; if it is too slow, the interest will be exhausted before the greatest demand upon it has been made—a fault to which comedy is specially liable; if it is involved or inverted, a vague uncertainty will take the place of an eager or agreeable suspense, the action will seem to halt, or a fall will begin prematurely. In the contrivance of the *climax* itself lies one of the chief tests of the dramatist's art; for while in the transactions of real life their climax is often only a matter of assumption, in the action of a drama its climax should present itself as self-evident. In the middle of everything, says the Greek poet, lies the strength; and this strongest or highest point it is the task of the dramatist to make manifest. Much here depends upon the niceties of constructive instinct; much (as in all parts of the action) upon a thorough dramatic transformation of the subject. The historical drama here presents peculiar difficulties, and perhaps the example of *Henry VIII.*, as compared with Shakespeare's other historical plays, may be held to furnish an instructive example of defective (because hasty) workmanship.

From the climax, or height, the action proceeds through its *fall* to its *close*, which in a drama with an unhappy ending we still call its *catastrophe*, while to terminations in general we apply the term *dénouement*. This latter name would, however, more properly be used in the sense in which Aristotle employs its Greek equivalent *λύσις*—the untying of the knot—of the whole of the second part of the action, from the climax downwards. If, in the management of the climax, everything depended upon making the

effect, in the fall everything depends upon not marring it. This may be ensured by a rapid progress to the close; but neither does every action admit of such treatment, nor is it in accordance with the character of those actions which are of a complicated kind. With the latter, therefore, the *fall* is often a *return*—i.e., in Aristotle's phrase, a change into the reverse of what is expected from the circumstances of the action (*περιπέτεια*),—as in *Coriolanus*, where the Roman story lends itself so admirably to dramatic demands. In any case the art of the dramatist is in this part of his work called upon for the surest exercise of its tact and skill. The effect of the climax has been to concentrate the interest; the fall must therefore, above all, avoid dissipating it. The use of episodes is not even now excluded; but they must be of a more directly significant kind than is necessary in the earlier stages of the drama, even where serving the purpose of relief they must help to keep alive the interest previously raised to its highest pitch. This may be effected by a return or revolution; or again, by the raising of obstacles between the height of the action and its expected consequences, by the suggestion in tragedy of a seemingly possible recovery or escape from them (as in the wonderfully powerful construction of the latter part of *Macbeth*), by the gradual removal in comedy, or wherever the interest of the action is less intense, of such difficulties as the growth and climax have occasioned. In all kinds of the drama *discovery* will remain, as it was in the judgment of Aristotle, a most effective expedient; but it should be a discovery which has been foreshadowed by that method of treatment which in its consummate master, Sophocles, has been termed *lus irony*. Nowhere should the close or catastrophe be other than a consequence of the action itself. Sudden revulsions from the conditions of the action—such as the *deus ex machina*, or the revising officer of the emperor of China, or the nabob returned from India bring about—condemn themselves as unsatisfactory makeshifts. However sudden, and even, in manner of accomplishment, surprising, may be the catastrophe, it should not be unprepared, but like every other part of the action should preserve its organic connection with the whole. The sudden suicides which terminate so many tragedies, and the paternal blessings which close an equal number of comedies, should be something more than a signal for the fall of the curtain.

The action of a drama, besides being one and complete in itself, ought likewise to be *probable*. The probability required of a drama is not that of actual or historical experience—it is a conditional probability, or in other words the consistency of the course of the action with the conditions under which, and with the characters by which, the dramatist has chosen to carry it on. As to the former, he is fettered by no restrictions save those which he imposes upon himself, whether or not in deference to the usages of certain accepted species of dramatic composition. Ghosts appear neither in real life nor in dramas of real life, but the introduction of supernatural agency is neither enjoined nor prohibited by any general dramatic law. The use of such expedients is as open to the dramatic as to any other poet; the judiciousness of his use of them depends upon the effect which, consistently with the general conduct of his action, they will exercise upon the spectator, whom other circumstances may or may not predispose to their acceptance. The ghost in *Hamlet* belongs to the action of the play; the ghost in the *Persæ* is not intrinsically less probable, but the apparition seems to spring, so to speak, less naturally out of the atmosphere around it. Dramatic probability has, however, a far deeper meaning than this. The *Eumenides* is probable with all its primitive mysteriousness, and *Macbeth* with all its barbarous witchcraft. The proceedings of the feathered builders of Cloudecockootown

are as true to dramatic probability as are the pranks of Oberon's fairies. In other words, it is in the consistency of the action with the characters, and of the characters with themselves, that this dramatic probability lies. The dramatist has to represent characters affected by the progress of an action in a particular way, and contributing to it in a particular way, because, if consistent with themselves, they *must* be so affected, and *must* so act.

Upon the invention and conduct of his characters the dramatist must therefore expend a great proportion of his labour. His treatment of them will, in at least as high a degree as his choice of subject, conception of action, and method of construction, determine the effect which his work produces. And while there are aspects of the dramatic art under which its earlier history already exhibits an unsurpassed degree of perfection, there is none under which its advance is more perceptible than this. Many causes have contributed to this result; the chief is to be sought in the multiplication of the opportunities for mankind's study of man. The theories of the Indian critics on the subject of dramatic character are a scaffolding more elaborate than the edifice it surrounds. Aristotle's remarks on the subject are scanty, and it may be unhesitatingly asserted that the strength of the dramatic literature from whose examples he abstracted his maxims is not to be sought in the fulness or variety of its characterization. This relative deficiency, the outward conditions of the Greek theatre—the remoteness of actor from spectator, and the consequent necessity for the use of masks, and for the raising and therefore conventionalizing of the tones of the voice—undoubtedly helped to occasion. Later Greek and Roman comedy, with a persistency furnishing a remarkable illustration of the force of habit, limited their range of characters to an accepted gallery of types. Nor is it easy to ignore the fact that these examples, and the influence of national tendencies of mind and temperament, have inclined the dramatists of the Romance nations to attach less importance to characterization of a closer and more varied kind than to interest of action and effectiveness of construction. The Italian and the Spanish drama more especially, and the French during a great part of its history, have in general shown a disposition to present their characters, as it were, ready made—whether in the case of tragic heroes and heroines, or in that of comic types, often moulded according to a long-lived system of local or national selection. It is in the Germanic drama, and in its master Shakespeare above all, that the individualization of characters has been carried to its furthest point, and that their significance has been allowed to work itself out in closest connection with the progress of the dramatic action to which they belong.

But, however the method and scope of characterization may vary under the influence of different historical epochs and different tendencies or tastes of races or nations, the laws of this branch of the dramatic art are everywhere based on the same essential requirements. What interests us in a man or woman in real life, or in the impressions we form of historical personages, is that which seems to us to individualize them. A dramatic character must therefore, whatever its part in the action, be sufficiently marked in its distinctive features to interest the imagination; with these its subsequent conduct must be consistent, and to these its participation in the action must correspond. In order that such should be the result, the dramatist must first have distinctly conceived the character, whatever may have suggested it to him. If, for instance, he has taken it, as the phrase is, from history or from contemporary life, he must transform it, just as he must transform the subject of the action into the action itself. His task is not to paint a copy of any particular man, but to conceive a kind of man—of which a particular individual may have occurred

to him as a suggestive illustration—under the operation of particular circumstances. His conception, growing and modifying itself with the progress of that of the action, will determine the totality of the character he creates. The likeness which the result bears to an actual or historical personage may very probably, from secondary points of view, concern the success of his creation, upon its dramatic effect this likeness can have no influence whatever. In a different sense from that in which Shakespeare used the words, it should be possible to say of every dramatic character which it is sought to identify with an actual personage, "This is not the man." The mirror of the drama is not a photographic apparatus.

Distinctiveness, as the primary requisite in dramatic characterization, is to be demanded in the case of all personages introduced into a dramatic action, but not in all cases in an equal degree. Schiller, in adding to the *dramatis personæ* of his *Fiesco* superscriptions of their chief characteristics, labels Sacco as "an ordinary person," and this suffices for Sacco. Between Bassanio's two unsuccessful rivals in the trial of the caskets there is difference enough for the dramatic purpose of their existence. But with the great masters of characterization a few touches, of which the true actor's art knows how to avail itself, distinguish even their lesser characters from one another; and every man is in his humour down to the third citizen. Elaboration is necessarily reserved for characters who are the more important contributors to the action, and the fulness of elaboration for its heroes. Many expedients may lend their aid to the higher degrees of distinctiveness. In characters designed to influence the whole of the action it must be marked early, in others in due relation to their contribution towards the course of the plot. Much is gained by a significant introduction of hero or heroine,—so Antigone is dragged in by the watchman, Gloucester enters alone upon the scene, Volpone is discovered in adoration of his golden saint. Nothing marks character more clearly than the use of contrast—as of Othello with Iago, of Octavio with Max Piccolomini, of Joseph with Charles Surface. Nor is direct antithesis the only effective kind of contrast; Cassius is a foil to Brutus, and Leonora to her namesake the Princess. But besides impressing the imagination as a conception distinct in itself, each character must maintain a consistency between its conduct in the action and the features it has established as its own. This consistency does not imply uniformity; for, as Aristotle observes, there are characters which, to be represented with uniformity, must be presented as uniformly un-uniform. Of such consistently complex characters the great critic cites no instances, nor indeed are they of frequent occurrence in Greek tragedy; in the modern drama Hamlet is their unrivalled exemplar; and Weislingen in Goethe's *Gotz*, and Alceste in the *Misanthrope*, may be mentioned as other illustrations in dramas widely different from one another. It should be added that those dramatic literatures which freely admit of a mixture of the serious with the comic element thereby enormously increase the opportunities of varied characterization. The difficulty of the task at the same time enhances the effect resulting from its satisfactory solution; and if the conception of a character is found to bear a variety of tests resembling that which experience shows life to have at hand for every man, its naturalness, as we term it, becomes more obvious to the imagination. Naturalness is only another word for what Aristotle terms propriety; the artificial rules by which usage has at times sought to define particular species of character are in their origin only a convenience of the theatre, though they have largely helped to conventionalize dramatic characterization. Lastly, a character should be directly effective with regard to the dramatic action in which it

takes part,—that is to say, the influence it exerts upon the progress of the action should correspond to its distinctive features, the conduct of the play should seem to spring from the nature of its characters. Hence even the minor characters should not idly intervene, and, before they intervene significantly, we should be prepared by some previous notion of them. The chief characters, on the other hand, should predominate over or determine the course of the action; its entire conception should harmonize with their distinctive features; it is only a Prometheus whom the gods bind fast to a rock, only a Juliet who will venture into a living death for her Romeo. Thus in a sense chance is excluded from dramatic action, or rather, like every other element in it, bends to the dramatic idea. And in view of this predominance of character over action, we may appropriately use such expressions as a tragedy of love or jealousy or ambition, or a comedy of character—by which is merely meant one whose preponderating interest lies in the effectiveness with which its conduct impresses upon the mind the conception of its chief character or characters.

The term *manners* (as employed in a narrower sense than the Aristotelian) applies to that which colours both action and characters, but does not determine the essence of either. As exhibiting human agents under certain conditions of time and place, and of the various relations of community existing or conceivable among men, the action of a drama, together with the characters engaged in it and the incidents and circumstances belonging to it, must be more or less suited to the external conditions assumed. From the assumption of some such conditions not even those dramatic species which indulge in the most sovereign licence, such as Old Attic comedy or burlesque in general, can wholly emancipate themselves; and even supernatural characters and actions must adapt themselves to some antecedents. But it depends altogether on the measure in which the nature of an action and the development of its characters are affected by considerations of time and place, or of temporary social systems and the transitory distinctions they produce, whether the imitation of a particular kind of manners becomes a significant element in a particular play. What is of vanishing importance in one may be an adjunct of inestimable value in another. The Hindoo caste-system is an antecedent of every Hindoo drama, and the peculiar organization of Chinese society of nearly every Chinese with which we are acquainted. Greek tragedy itself, though treating subjects derived from no historic age, had established a standard of manners from which in its decline it did not depart with impunity. The imitation of manners of a particular age or country may or may not be of moment in a play. The conjuncture of the Crusades is merely a felicitous choice for the time of action of *Nathan the Wise*; but the dramatic conflict of *Minna von Barnhelm* derives half its life from the background of the Seven Years' War. In some dramas, and in some species of drama, time and place are so purely imaginary and so much a matter of indifference that the adoption of a purely conventional standard of manners, or at least the exclusion of any definitely fixed one, is here desirable. The ducal reign of Theseus at Athens (when ascertained) does not date *A Midsummer Night's Dream*; nor do the coasts of Bohemia localize the manners of the customers of Autolycus. Where, on the other hand, as more especially in the historic drama, or in that kind of comedy which directs its shafts against the ridiculous vices of a particular age or country, the likeness of the manners represented to what is more or less known possesses significance, there the dramatist will use care in his colouring. How admirably is the French court specialized in *Henry V.*, how completely are we transplanted among the

burghers of Brussels in the opening scenes of *Egmont*! What a picture of a clique we have in the *Précieuses ridicules* of Molière; what a reproduction of a class in the pot-house politicians of Holberg! Yet even in such instances the dramatist will only use what suits his dramatic purpose; he will select, not transfer in mass, historic features, and discriminate in his use of modern instances. The details of historic fidelity, and the lesser shades distinguishing the varieties of social usage, he will introduce at his choice, or leave to be supplied by the actor. Where the reproduction of manners becomes the primary purpose of a play, its effect can only be of an inferior kind; and a drama purely of manners is a contradiction in terms.

No complete system of dramatic species can be abstracted from any one dramatic literature. They are often the result of particular antecedents, and their growth is often affected by peculiar conditions. Different nations or ages use the same name, and may preserve some of the same rules, for species which in other respects their usage may have materially modified from that of their neighbours or predecessors. Who would undertake to define, except in their successive applications, such terms as *tragi-comedy* or *melodrama*? Yet this does not imply that all is confusion in the terminology as to the species of the drama. In so far as they are distinguishable according to the effects which their actions, or those which the preponderating parts of their actions, produce, they may primarily be ranged in accordance with the broad difference established by Aristotle between tragedy and comedy. *Tragic* and *comic* effects differ in regard to the emotions of the mind which they excite; and a drama is tragic or comic according as such effects are produced by it. The strong or serious emotions are alone capable of exercising upon us that influence which, employing a bold but marvellously happy figure, Aristotle termed *purification*, and which a Greek comedian, after a more matter-of-fact fashion, thus expressed:

"For whensoever a man observes his fellow
Bear wrongs more grievous than himself has known,
More easily he bears his own misfortunes,"

i.e., the petty troubles of self which disturb without elevating the mind are driven out by the sympathetic participation in greater griefs, which raises while it excites the mind employed upon contemplating them. It is to these emotions—which are and can be no others than pity and terror—that actions and characters which we call tragic appeal. Those which we term comic address themselves to the sense of the ridiculous, and their subjects are those vices and moral infirmities, the representation of which is capable of touching the springs of laughter. Where, accordingly, a drama excludes all effects except those of the former class, it may be called a pure *tragedy*; when all except those of the latter, a pure *comedy*. In those dramas where the effects are mixed, it is the nature of the main action and of the main characters (as determined by their distinctive features) which alone enables us to classify such plays as serious or humorous dramas—or as tragic or comic, if we choose to preserve the terms. But the classification admits of a variety of transitions, from pure tragedy to mixed, from mixed tragedy to mixed comedy, and thence to pure comedy and her slighter sister *farce*. This method of distinction has no concern with the mere question of the termination of a play, according to which Philostratus and other authorities have sought to distinguish between tragic and comic dramas. The serious drama which ends happily (the German *Schauspiel*) is not a species co-ordinate with tragedy and comedy, but only one subordinate to the former, if, indeed, it be necessary to distinguish it as a species at all. Other

are as true to dramatic probability as are the pranks of Oberon's fairies. In other words, it is in the consistency of the action with the characters, and of the characters with themselves, that this dramatic probability lies. The dramatist has to represent characters affected by the progress of an action in a particular way, and contributing to it in a particular way, because, if consistent with themselves, they *must* be so affected, and *must* so act.

Character-
ization.

Advance of
the drama
in this
respect.

Upon the invention and conduct of his characters the dramatist must therefore expend a great proportion of his labour. His treatment of them will, in at least as high a degree as his choice of subject, conception of action, and method of construction, determine the effect which his work produces. And while there are aspects of the dramatic art under which its earlier history already exhibits an unsurpassed degree of perfection, there is none under which its advance is more perceptible than this. Many causes have contributed to this result; the chief is to be sought in the multiplication of the opportunities for mankind's study of man. The theories of the Indian critics on the subject of dramatic character are a scaffolding more elaborate than the edifice it surrounds. Aristotle's remarks on the subject are scanty, and it may be unhesitatingly asserted that the strength of the dramatic literature from whose examples he abstracted his maxims is not to be sought in the fulness or variety of its characterization. This relative deficiency, the outward conditions of the Greek theatre—the remoteness of actor from spectator, and the consequent necessity for the use of masks, and for the raising and therefore conventionalizing of the tones of the voice—undoubtedly helped to occasion. Later Greek and Roman comedy, with a persistency furnishing a remarkable illustration of the force of habit, limited their range of characters to an accepted gallery of types. Nor is it easy to ignore the fact that these examples, and the influence of national tendencies of mind and temperament, have inclined the dramatists of the Romance nations to attach less importance to characterization of a closer and more varied kind than to interest of action and effectiveness of construction. The Italian and the Spanish drama more especially, and the French during a great part of its history, have in general shown a disposition to present their characters, as it were, ready made—whether in the case of tragic heroes and heroines, or in that of comic types, often moulded according to a long-lived system of local or national selection. It is in the Germanic drama, and in its master Shakespeare above all, that the individualization of characters has been carried to its furthest point, and that their significance has been allowed to work itself out in closest connection with the progress of the dramatic action to which they belong.

Requisites
of cha-
racter.

But, however the method and scope of characterization may vary under the influence of different historical epochs and different tendencies or tastes of races or nations, the laws of this branch of the dramatic art are everywhere based on the same essential requirements. What interests us in a man or woman in real life, or in the impressions we form of historical personages, is that which seems to us to individualize them. A dramatic character must therefore, whatever its part in the action, be sufficiently marked in its distinctive features to interest the imagination; with these its subsequent conduct must be consistent, and to these its participation in the action must correspond. In order that such should be the result, the dramatist must first have distinctly conceived the character, whatever may have suggested it to him. If, for instance, he has taken it, as the phrase is, from history or from contemporary life, he must transform it, just as he must transform the subject of the action into the action itself. His task is not to paint a copy of any particular man, but to conceive a kind of man—of which a particular individual may have occurred

to him as a suggestive illustration—under the operation of particular circumstances. His conception, growing and modifying itself with the progress of that of the action, will determine the totality of the character he creates. The likeness which the result bears to an actual or historical personage may very probably, from secondary points of view, concern the success of his creation; upon its dramatic effect this likeness can have no influence whatever. In a different sense from that in which Shakespeare used the words, it should be possible to say of every dramatic character which it is sought to identify with an actual personage, "This is not the man." The mirror of the drama is not a photographic apparatus.

Distinctiveness, as the primary requisite in dramatic characterization, is to be demanded in the case of all personages introduced into a dramatic action, but not in all cases in an equal degree. Schiller, in adding to the *dramatis personæ* of his *Fiesco* inscriptions of their chief characteristics, labels Sacco as "an ordinary person," and this suffices for Sacco. Between Bassanio's two unsuccessful rivals in the trial of the caskets there is difference enough for the dramatic purpose of their existence. But with the great masters of characterization a few touches, of which the true actor's art knows how to avail itself, distinguish even their lesser characters from one another; and every man is in his humour down to the third citizen. Elaboration is necessarily reserved for characters who are the more important contributors to the action, and the fulness of elaboration for its heroes. Many expedients may lend their aid to the higher degrees of distinctiveness. In characters designed to influence the whole of the action it must be marked early, in others in due relation to their contribution towards the course of the plot. Much is gained by a significant introduction of hero or heroine,—so Antigone is dragged in by the watchman, Gloucester enters alone upon the scene, Volpone is discovered in adoration of his golden saint. Nothing marks character more clearly than the use of contrast—as of Othello with Iago, of Octavio with Max Piccolomini, of Joseph with Charles Surface. Nor is direct antithesis the only effective kind of contrast; Cassius is a foil to Brutus, and Leonora to her namesake the Princess. But besides impressing the imagination as a conception distinct in itself, each character must maintain a consistency between its conduct in the action and the features it has established as its own. This consistency does not imply uniformity; for, as Aristotle observes, there are characters which, to be represented with uniformity, must be presented as uniformly un-uniform. Of such consistently complex characters the great critic cites no instances, nor indeed are they of frequent occurrence in Greek tragedy; in the modern drama Hamlet is their unrivalled exemplar; and Weislingen in Goethe's *Götz*, and Alceste in the *Misanthrope*, may be mentioned as other illustrations in dramas widely different from one another. It should be added that those dramatic literatures which freely admit of a mixture of the serious with the comic element thereby enormously increase the opportunities of varied characterization. The difficulty of the task at the same time enhances the effect resulting from its satisfactory solution; and if the conception of a character is found to bear a variety of tests resembling that which experience shows life to have at hand for every man, its naturalness, as we term it, becomes more obvious to the imagination. Naturalness is only another word for what Aristotle terms propriety; the artificial rules by which usage has at times sought to define particular species of character are in their origin only a convenience of the theatre, though they have largely helped to conventionalize dramatic characterization. Lastly, a character should be directly effective with regard to the dramatic action in which it

takes part,—that is to say, the influence it exerts upon the progress of the action should correspond to its distinctive features, the conduct of the play should seem to spring from the nature of its characters. Hence even the minor characters should not idly intervene, and, before they intervene significantly, we should be prepared by some previous notion of them. The chief characters, on the other hand, should predominate over or determine the course of the action; its entire conception should harmonize with their distinctive features; it is only a Prometheus whom the gods bind fast to a rock, only a Juliet who will venture into a living death for her Romeo. Thus in a sense chance is excluded from dramatic action, or rather, like every other element in it, bends to the dramatic idea. And in view of this predominance of character over action, we may appropriately use such expressions as a tragedy of love or jealousy or ambition, or a comedy of character—by which is merely meant one whose preponderating interest lies in the effectiveness with which its conduct impresses upon the mind the conception of its chief character or characters.

The term *manners* (as employed in a narrower sense than the Aristotelian) applies to that which colours both action and characters, but does not determine the essence of either. As exhibiting human agents under certain conditions of time and place, and of the various relations of community existing or conceivable among men, the action of a drama, together with the characters engaged in it and the incidents and circumstances belonging to it, must be more or less suited to the external conditions assumed. From the assumption of some such conditions not even those dramatic species which indulge in the most sovereign licence, such as Old Attic comedy or burlesque in general, can wholly emancipate themselves; and even supernatural characters and actions must adapt themselves to some antecedents. But it depends altogether on the measure in which the nature of an action and the development of its characters are affected by considerations of time and place, or of temporary social systems and the transitory distinctions they produce, whether the imitation of a particular kind of manners becomes a significant element in a particular play. What is of vanishing importance in one may be an adjunct of inestimable value in another. The Hindu caste-system is an antecedent of every Hindu drama, and the peculiar organization of Chinese society of nearly every Chinese with which we are acquainted. Greek tragedy itself, though treating subjects derived from no historic age, had established a standard of manners from which in its decline it did not depart with impunity. The imitation of manners of a particular age or country may or may not be of moment in a play. The conjuncture of the Crusades is merely a felicitous choice for the time of action of *Nathan the Wise*; but the dramatic conflict of *Minna von Barnhelm* derives half its life from the background of the Seven Years' War. In some dramas, and in some species of drama, time and place are so purely imaginary and so much a matter of indifference that the adoption of a purely conventional standard of manners, or at least the exclusion of any definitely fixed one, is here desirable. The ducal reign of Theseus at Athens (when ascertained) does not date *A Midsummer Night's Dream*; nor do the coasts of Bohemia localize the manners of the customers of Antolycus. Where, on the other hand, as more especially in the historic drama, or in that kind of comedy which directs its shafts against the ridiculous vices of a particular age or country, the likeness of the manners represented to what is more or less known possesses significance, there the dramatist will use care in his colouring. How admirably is the French court specialized in *Henry V.*, how completely are we transplanted among the

burghers of Brussels in the opening scenes of *Egmont*! What a picture of a clique we have in the *Précieuses ridicules* of Molière; what a reproduction of a class in the pot-house politicians of Holberg! Yet even in such instances the dramatist will only use what suits his dramatic purpose; he will select, not transfer in mass, historic features, and discriminate in his use of modern instances. The details of historic fidelity, and the lesser shades distinguishing the varieties of social usage, he will introduce at his choice, or leave to be supplied by the actor. Where the reproduction of manners becomes the primary purpose of a play, its effect can only be of an inferior kind; and a drama purely of manners is a contradiction in terms.

No complete system of dramatic species can be abstracted from any one dramatic literature. They are often the result of particular antecedents, and their growth is often affected by peculiar conditions. Different nations or ages use the same name, and may preserve some of the same rules, for species which in other respects their usage may have materially modified from that of their neighbours or predecessors. Who would undertake to define, except in their successive applications, such terms as *tragic-comedy* or *melodrama*? Yet this does not imply that all is confusion in the terminology as to the species of the drama. In so far as they are distinguishable according to the effects which their actions, or those which the preponderating parts of their actions, produce, they may primarily be ranged in accordance with the broad difference established by Aristotle between tragedy and comedy. *Tragic* and *comic* effects differ in regard to the emotions of the mind which they excite; and a drama is tragic or comic according as such effects are produced by it. The strong or serious emotions are alone capable of exercising upon us that influence which, employing a bold but marvellously happy figure, Aristotle termed *purification*, and which a Greek comedian, after a more matter-of-fact fashion, thus expressed:

"For whensoever a man observes his fellow
Bear wrongs more grievous than himself has known,
More easily he bears his own misfortunes;"

i.e., the petty troubles of self which disturb without elevating the mind are driven out by the sympathetic participation in greater griefs, which raises while it excites the mind employed upon contemplating them. It is to these emotions—which are and can be no others than pity and terror—that actions and characters which we call tragic appeal. Those which we term comic address themselves to the sense of the ridiculous, and their subjects are those vices and moral infirmities, the representation of which is capable of touching the springs of laughter. Where, accordingly, a drama excludes all effects except those of the former class, it may be called a pure *tragedy*; when all except those of the latter, a pure *comedy*. In those dramas where the effects are mixed, it is the nature of the main action and of the main characters (as determined by their distinctive features) which alone enables us to classify such plays as serious or humorous dramas—or as tragic or comic, if we choose to preserve the terms. But the classification admits of a variety of transitions, from pure tragedy to mixed, from mixed tragedy to mixed comedy, and thence to pure comedy and her slighter sister *farce*. This method of distinction has no concern with the mere question of the termination of a play, according to which Philostratus and other authorities have sought to distinguish between tragic and comic dramas. The serious drama which ends happily (the German *Schauspiel*) is not a species co-ordinate with tragedy and comedy, but only one subordinate to the former, if, indeed, it be necessary to distinguish it as a species at all. Other

distinctions may be almost infinitely varied according to the point of view adopted for the classification

The historical sketch of the drama attempted in the following pages will best serve to indicate the successive growth of national dramatic species, many of which by asserting their influence in other countries and ages than those which gave birth to them, have acquired a more than national significance.

The art of acting

The art of acting, whose history forms an organic though a distinct part of that of the drama, necessarily possesses a theory and a technical system of its own. But into these it is impossible here to enter. One claim, however, should be vindicated for the art of acting, viz., that though it is a dependent art, and most signally so in its highest forms, yet its true exercise implies a creative process. The conception of a character is determined by antecedents not of the actor's own making; and the term originality can be applied to it only in a relative sense. Study and reflection enable him, with the aid of experience and of the intuition which genius bestows, but which experience may in a high degree supply, to interpret, to combine, and to supplement given materials. But in the transformation of the conception into the represented character the actor's functions are really creative, for here he *becomes* the character by means which belong to his art alone. The distinctiveness he gives to the character by making the principal features recognized by him in it its groundwork;—the consistency which he maintains in it between groundwork and details;—the appropriateness which he preserves in it to the course of the action and the part borne in it by the character.—all these are produced by himself, though suggested by the conception he has derived from his materials. As to the means at his disposal, they are essentially of two kinds only, but not all forms of the drama have admitted of the use of both, or of both in the same completeness. All acting includes the use of gesture, or, as it has been more comprehensively termed, of bodily eloquence. From various points of view its laws regulate the actor's bearing, walk, and movements of face and limbs. They teach what is æsthetically permitted and what is æsthetically pleasing. They deduce from observation what is appropriate to the expression of particular affections of the mind and of their combinations, of emotions and passions, of physical and mental conditions—joy and grief, health and sickness, waking, sleeping, and dreaming, madness, collapse, and death—of particular ages of life and temperaments, as well as of the distinctive characteristics of race, nationality, or class. While under certain conditions—as in the masked drama—the use of bodily movement as one of the means of expression has at times been partially restricted, there have been, or are, forms of the drama which have altogether excluded the use of speech (such as pantomime), or have restricted the manner of its employment (such as opera). In the spoken drama the laws of rhetoric regulate the actor's use of speech, but under conditions of a special nature. Like the orator, he has to follow the laws of pronunciation, modulation, accent, and rhythm (the last in certain kinds of prose as well as in such forms of verse as he may be called upon to reproduce). But he has also to give his attention to the special laws of dramatic delivery, which vary in soliloquy and dialogue, and in such narrative or lyrical passages as may occur in his part.

Its means

Gesture.

Speech.

Costume.

The totality of the effect produced by the actor will in some degree depend upon other aids, among which those of a purely external kind will not be lost sight of. But the significance of costume in the actor, like that of decoration and scenery in an action, is a wholly relative one, and is to a large measure determined by the claims which custom enables the theatre to make, or forbids its making, upon

the imagination of the spectators. The actor's real achievement lies in the transformation which the artist himself effects; nor is there any art more sovereign in the use it can make of its means, or so happy in the directness of the results it can accomplish by them.

The origin of the INDIAN drama may unhesitatingly be described as purely native. The Mahometans when they overran India brought no drama with them; the Persians, the Arabs, and the Egyptians were without a national theatre. It would be absurd to suppose the Indian drama to have owed anything to the Chinese or its offshoots. On the other hand, there is no real evidence for assuming any influence of Greek examples upon the Indian drama at any stage of its progress. Finally, it had passed into its decline before the dramatic literature of modern Europe had sprung into being.

The HINDU writers ascribe the invention of dramatic entertainments to an inspired sage Bharata, or to the communications made to him by the god Brahma himself concerning an art gathered from the Vedas. As the word *Bharata* signifies an actor, we have clearly here a mere personification of the invention of the drama. Three kinds of entertainments, of which the *nāṭya* (defined as a dance combined with gesticulation and speech) comes nearest to the drama, were said to have been exhibited before the gods by the spirits and nymphs of Indra's heaven, and to these the god Śiva added two new styles of dancing.

The origin of the Indian drama was thus doubtless religious; it sprang from the union of song and dance in the festivals of the gods, to which were afterwards added narrative recitation, and first sung, then spoken, dialogue. Such scenes and stories from the mythology of Viṣṇu are still occasionally enacted by pantomime or spoken dialogue in India (*jātras* of the Bengalis; *rāsas* of the Western Provinces); and the most ancient Indian play was said to have treated an episode from the history of that deity,—the choice of him as a consort by Laxmi,—a favourite kind of subject in the Indian drama. The tradition connecting its earliest themes with the native mythology of Viṣṇu agrees with that ascribing the origin of a particular kind of dramatic performance—the *saṅgīta*—to Kṛishṇa and the shepherdesses. The author's later poem, the *Gītāgovinda*, has been conjectured to be suggestive of the earliest species of HINDU dramas. But while the epic poetry of the Hindus gradually approached the dramatic in the way of dialogue, their drama developed itself independently out of the union of the lyric and the epic forms. Their dramatic poetry arose later than their epos, whose great works, the *Mahābhārata* and the *Rāmāyaṇa*, had again been long preceded by the hymnody of the *Vedas*—just as the Greek drama followed upon the Homeric poems, and these had been preceded by the early hymns. The beginnings of the Indian drama may accordingly belong to the 3d century B.C., or to a rather earlier date. But by the time it produced the first specimens with which we are acquainted, it had already reached its zenith; and it was therefore looked upon as having sprung into being as a perfect art. We know it only in its glory, in its decline, and in its decay.

The history of Indian dramatic literature may be roughly divided into the following periods.—

I. *From the 1st century B.C. to the 10th century A.D.*—First period. This period belongs to the pre-Mahometan age of Indian history, but to that second division of it in which Buddhism had already become a powerful factor in the social, as well as in the moral and intellectual, life of the land. It is the classical period of the Hindu drama, and includes the works of its two indisputably greatest masters. Of these Kālidāsa was by far the earlier, who lived at the

Chronology.

(classical).

court of King Vikramāditya of Avanti (died 56 B.C.), being accounted the brightest of its "nine gems" of genius. He is the author of *Sākuntalā*,—the work Sir William Jones's translation of which first revealed to the Western world of letters the existence of an Indian drama. It is a dramatic love-idiyl of surpassing beauty, and, in the opinion of the highest authorities, one of the master-pieces of the poetic literature of the world. Kālidāsa's other drama, *Vikrama and Urvāṣī* (*The Hero and the Nymph*), though unequal as a whole to *Sākuntalā*, contains one act of incomparable loveliness; and its enduring effect upon Indian dramatic literature is shown by the imitations of it in later plays. To Kālidāsa has likewise been attributed a third play—the *Mālavikāgnimitra*; but it is doubtful whether this comedy, though held to be of ancient date, was not composed by a different poet of the same name.

Another work of high merit, the pathetic *Mrichchhakatī* (*The Toy-Cart*), a domestic drama with a public underplot, may possibly belong to the close of the 2d century A.D., and seems certainly of an earlier date than the 10th. It is attributed (as is not uncommon with Indian plays) to a royal author named Śūdraka.

The palm of pre-eminence is disputed with Kālidāsa by the great dramatic poet Bābhavūti (called Ārikāṁṭha, or he in whose throat is fortune), who flourished in the earlier part of the 8th century. While he is considered more artificial in language than his rival, and in general more bound by rules, he can hardly be deemed his inferior in dramatic genius. Of his three extant plays, *Mahāvāra-Charitra* and *Uttara-Rāma-Charitra* are heroic dramas concerned with the adventures of Rāma (the seventh incarnation of Viṣṇu); the third, the powerful *Mālātī and Mādhava*, has love for its theme, and has been called (with more aptitude than such comparisons usually possess) the *Romeo and Juliet* of the Hindus. It is considered by their critical authorities the best example of the *prakaraṇa*, or drama of domestic life.

Among the remaining chief works of Indian dramatic literature, the *Veṇī-Sāmhara* is thought probably to date from about the 8th or 9th century. Its author's name seems doubtful; the play is described as one in which both pathos and horror are exaggerated, and which in the violence of its action recalls the manner of Shakespeare's predecessors. The next series of plays forms a transition between the first period of Indian dramatic literature and

II. The period of decline, which may be reckoned from about the 11th to about the 14th century of our era, and of which the beginning roughly coincides with that of a continuous series of Mahometan invasions of India. *Hanūman-Nāṭaka*, or "the great *Nāṭaka*" (for this play, the work of several hands, surpasses all other Indian dramas in length, extending over not less than fourteen acts), dates from the 10th or 11th century. Its story is taken from the Rāma-cycle, and a prominent character in it is the mythical monkey-chief Hanūmat, to whom, indeed, tradition ascribed the original authorship of the play. Kṛishṇamitra's "theosophic mystery," as it has been called, of *Prabodha-Chandrodaya* (*The Rise of the Moon of Insight*, i.e., the victory of true doctrine over error), is ascribed by one authority to the middle of the 11th century, by another to about the end of the 12th. The dates of the famous *Ratnavālī* (*The Necklace*), a court-comedy of love and intrigue, with a half-Terentian plot, and of the interesting Buddhist drama *Nāgānanda*, which begins as an erotic play but passes into a most impressive exemplification of the supreme virtue of self-sacrifice, depend on the disputed question of their respective authorship. One of them belongs to the first quarter of the 12th century, the other to an earlier time. Finally, Viśākhadatta's interesting drama of political intrigue, *Mudrā-Rakṣasa* (*The Signet of*

the Minister), in which prince Chandragupta, presumably identifiable with Sandrocottus, makes his appearance, was probably composed later than the end of the 12th century. This is the only Indian play known to us with an essentially historical fable—a noteworthy circumstance, if (as is most likely) it was produced at a time when the Mahometan invasions had already begun.

The remaining plays of which it has been possible to conjecture the dates range in the time of their composition from the end of the 11th to the 14th century, and belong to the period of decline. Of this period, as compared with the first, the general characteristics seem to be an undue preponderance of narrative and description, and an affected and over-elaborated style. As a striking instance of this class is mentioned a play on the adventures of Rāma, the *Anargha-Rāghava*, which in spite, or by reason, of the commonplace character of its sentiments, the extravagance of its diction, and the obscurity of its mythology, is stated to enjoy a higher reputation with the pandits of the present age than the master-pieces of Kālidāsa and Bābhavūti. To the close of this period, the 14th century, has likewise (but without any pretension to certainty) been ascribed the only Tamil drama of which we possess an English version *Arichandra* (*The Martyr of Truth*) exemplifies—with a strange likeness in the contrivance of its plot to the *Book of Job* and *Faust*—in the trials of a heroically enduring king the maxim "Better die than lie."

III. Isolated plays remain from centuries later than the 14th; but these, which chiefly turn on the legends of Kṛishṇa (the last incarnation of Viṣṇu), may be regarded as a mere aftergrowth, and exhibit the Indian drama in its decay. Indeed, the latest of them, *Chitra-Yajna*, which was composed about the beginning of the present century, and still serves as a model for Bengali dramatic performances, is imperfect in its dialogue, which (after the fashion of Italian improvised comedy) it is left to the actors to supplement. Besides these there are farces or farcical entertainments, more or less indelicate, of uncertain dates.

The number of the plays which have descended to us from so vast an expanse of time is both relatively and absolutely small. Wilson doubts whether all the plays to be found, and those mentioned by Hindu writers on the drama, amount to many more than 60; and it has been seen that not more than three are ascribed to either of the two great masters. To these should be, however, added the plays in Tamil, stated to be about 100 in number, and to have been composed by poets who enjoyed the patronage of the Pandian kings of Madura. On the other hand, there is among the Hindus no dearth of dramatic theory. The sage Bharata, the reputed inventor of dramatic entertainments, was likewise revered as the father of dramatic criticism—a combination of functions to which the latter days of the English theatre might perhaps furnish an occasional parallel. The commentators (possibly under the influence of inspiration rather than as a strict matter of memory) constantly cite his *sūtras*, or aphorisms. (From *sūtra*, thread, was named the *sūtra-dhāra*, thread-holder, carpenter, a term applied to the architect and general manager of sacrificial solemnities, then to the director of theatrical performances). By the 11th century, when the drama was already approaching its decline, dramatic criticism had reached an advanced point; and the *Dasa-Rupaka* (of which the text belongs to that age) distinctly defines the ten several kinds of dramatic composition. Other critical works followed at later dates, exhibiting a rage for subdivision unsurpassed by the efforts of Western theorists, ancient or modern; the misfortune is that there should not be examples remaining (if they ever existed) to illustrate all the branches of so elaborate a dramatic system

Exclusiveness of the Indian drama.

"What," inquires the manager of an actor in the induction to one of the most famous of Indian plays, "are those qualities which the virtuous, the wise, the venerable, the learned, and the Brahmans require in a drama?" "Profound exposition of the various passions," is the reply, "pleasing interchange of mutual affection, loftiness of character, delicate expression of desire, a surprising story, and elegant language." "Then," says the manager (for the Indian dramatists, though not, like Ben Jonson, wont to "rail" the public "into approbation," are unaffected by *mauvaise honte*) "I recollect one." And he proceeds to state that "Babharūti has given us a drama composed by him, replete with all qualities, to which indeed this sentence is applicable: 'How little do they know who speak of us with censure! This entertainment is not for them. Possibly some one exists, or will exist, of similar tastes with myself; for time is boundless, and the world is wide.'" This self-possessed disregard of popularity, springing from an imperturbable consciousness of lofty aims, accounts for much that is characteristic of the higher class of Indian plays. It explains both their paucity and their length, renders intelligible the chief peculiarity in their diction, and furnishes the key to their most striking ethical as well as literary qualities. Connected in their origin with religious worship, they were only performed on solemn occasions, chiefly of a public nature, and more especially at seasons sacred to some divinity. Thus, though they might in some instances be reproduced, they were always written with a view to one particular solemn representation. Again, the greater part of every one of the plays of Northern India is written in Sanskrit, which ceased to be a popular language by 300 B.C., but continued the classical, and at the same time the sacred, form of speech of the Brahmans. Sanskrit is spoken by the heroes and principal personages of the plays, while the female and inferior characters use varieties, more or less refined, of the Prakrit languages (as a rule not more than three, that which is employed in the songs of the women being the poetic dialect of the most common Prakrit language, the Gauraseni). Hence, part at least of each play cannot have been understood by the large majority of the audience, except in so far as their general acquaintance with the legends or stories treated enabled them to follow the course of the action. Every audience thus contained an *inner* audience, which could alone feel the full effect of the drama. It is, then, easy to see why the Hindu critics should make demands upon the art, into which only highly-trained and refined intellects were capable of entering, or called upon to enter. The general public could not be expected to appreciate the sentiments expressed in a drama, and thus (according to the process prescribed by Hindu theory) to receive instruction by means of amusement. These sentiments are termed *rasas* (tastes or flavours), and said to spring from the *bhāvas* (conditions of mind and body). A variety of subdivisions is added; but the *saṁta rasa* is logically enough excluded from dramatic composition, inasmuch as it implies absolute quiescence.

Species of dramas.

The Hindu critics know of no distinction directly corresponding to that between tragedy and comedy, still less of any determined by the nature of the close of a play. For, in accordance with the child-like element of their character, the Hindus dislike an unhappy ending to any story, and a positive rule accordingly prohibits a fatal conclusion in their dramas. The general term for all dramatic compositions is *rūpaka* (from *rūpa*, form), those of an inferior class being distinguished as *uparūpaka*. Of the various subdivisions of the *rūpaka*, in a more limited sense, the *naṭaka*, or play proper, represents the most perfect kind. Its subject should always be celebrated and important—it is virtually either heroism or love, and most frequently the

latter—and the hero should be a demigod or divinity (such as Rāma in Babharūti's heroic plays) or a king (such as the hero of *Sākuntalā*). But although the earlier dramatists took their plots from the sacred writings or Purāṇas, they held themselves at liberty to vary the incidents,—a licence from which the later poets abstained. Thus, in accordance, perhaps, with the respective developments in the religious life of the two peoples, the Hindu drama in this respect reversed the progressive practice of the Greek. The *prakaraṇas* agree in all essentials with the *naṭakas* except that they are less elevated; their stories are mere fictions, taken from actual life in a respectable class of society.¹ Among the species of the *vyāyākya* may be mentioned the *troṭaka*, in which the personages are partly human, partly divine, and of which a famous example remains.² Of the *dhāna*, a monologue in one act, one literary example is extant—a curious picture of manners in which the speaker describes the different persons he meets at a spring festival in the streets of Kolahalaṭṭra.³ The satire of the farcical *prahasanas* is usually directed against the hypocrisy of ascetics and Brahmans, and the sensuality of the wealthy and powerful. These trifles represent the lower extreme of the dramatic scale, to which, of course, the principles that follow only partially apply.

Unity of action is strictly enjoined by Hindu theory, though not invariably observed in practice. Episodical or prolix interruptions are forbidden; but, in order to facilitate the connection, the story of the play is sometimes carried on by narratives spoken by actors or "interpreters," something after the fashion of the Chorus in *Henry V.*, or of Gower in *Pericles*. "Unity of time" is liberally, if rather arbitrarily, understood by the later critical authorities as limiting the duration of the action of a single year; but even this is exceeded in more than one classical play.⁴ The single acts are to confine the events occurring in them to "one course of the sun," and usually do so. "Unity of place" is unknown to the Hindu drama, by reason of the absence of scenery; for the plays were performed in the open courts of palaces, perhaps at times in large halls set apart for public entertainments, or in the open air. Hence change of scene is usually indicated in the texts; and we find⁵ the characters making long journeys on the stage, under the eyes of spectators not trained to demand "real" mileage.

With the solemn character of the higher kind of Pre-dramatic performances accord the rules and prohibitions defining what may be called the *proprieties* of the Indian drama. Not only should death never be inflicted *coram populo*, but the various operations of biting, scratching, kissing, eating, sleeping, the bath, and the marriage ceremony should never take place on the stage. Yet such rules are made to be occasionally broken. It is true that the mild humour of the *vidūṣhaka* is restricted to his "gesticulating eating" instead of perpetrating the obnoxious act.⁶ The charming love-scene in the *Sākuntalā* (at least in the earlier recension of the play) breaks off just as the hero is about to act the part of the bee to the honey of the heroine's lips.⁷ But later writers are less squeamish, or less refined. In two dramas⁸ the heroine is dragged on the stage by her braid of hair; and this outrage, a worse one than that imputed to Dunstan, is in both instances the motive of the action. In a third,⁹ sleeping and the marriage ceremony occur in the course of the representation.

The dramatic construction of the Indian plays presents no very striking peculiarities. They open with a benediction

¹ e.g., *Mricchakatikā*; *Mālatī* and *Māṭra*.

² *Vikrama and Urvashī*.

³ *Sākuntalā*; *Uttara-Rāma-Charitra*. ⁴ *Safada-Tilaka*.

⁵ *Nāgīnandā*, act i. ⁶ *Ariśatana*, act iv.

⁷ Act iii.; cf. *Nāgīnandā*, act iii.

⁸ *Vetī-Saṁhāra*; *Prachanda-Pandita*.

⁹ *Viddha-Salabhanakā*.

tion (*nāndi*), followed by "some account" of the author, and by an introductory scene between the manager and one of the actors, which is more or less skillfully connected with the opening of the play itself. This is divided into acts (*ankas*) and scenes; of the former a *nāṭaka* should have not fewer than 5, or more than 10; 7 appears a common number; "the great *nāṭaka*" reaches 14. Thus the length of the higher class of Indian plays is considerable—about that of an *Æschylean* trilogy, but not more than a single play was ever performed on the same occasion. Comic plays are restricted to two acts (here called *sandhus*). In theory the scheme of an Indian drama corresponds very closely to the general outline of dramatic construction given above; it is a characteristic merit that the business is rarely concluded before the last act. The piece closes, as it began, with a benediction or prayer. Within this framework room is found for situations as ingeniously devised and highly wrought as those in any modern Western play. What could be more pitiful than the scene in *Sākuntalā*, where the true wife appears before her husband, whose remembrance of her is fatally overclouded by a charm; what more terrific than that in *Mālatī* and *Mādhava*, where the lover rescues his beloved from the horrors of the charnel field? Recognition—especially between parents and children—frequently gives rise to scenes of a pathos which Euripides has not surpassed.¹ The ingenious device of a "play within the play" (so familiar to the English drama) is employed with the utmost success by Bābhavūti.² On the other hand, miraculous metamorphosis³ and, in a later play,⁴ vulgar magic lend their aid to the progress of the action. With scenes of strong effectiveness contrast others of the most delicate poetic grace—such as the indescribably lovely little episode of the two damsels of the god of love helping one another to pluck the red and green bud from the mango tree; or of gentle domestic pathos—such as that of the courtesan listening to the prattle of her lover's child, one of the prettiest scenes of a kind rarely kept free from affectation in the modern drama. For the *dénouement* in the narrower sense of the term the Indian dramatists largely resort to the expedient of the *deus ex machina*, often in a sufficiently literal sense.⁵

Every species of drama having its appropriate kind of hero or heroine, theory here again amuses itself with an infinitude of subdivisions. Among the heroines are to be noticed the courtesans, whose social position to some extent resembles that of the Greek *hetærae*, and association with whom does not seem in practice, however it may be in theory, to be regarded as a disgrace even to Brahmins.⁶ In general, the Indian drama indicates relations between the sexes subject to peculiar restraints of usage, but freer than those which Mahometan example seems to have introduced into higher Indian society. The male characters are frequently drawn with skill, and sometimes with genuine force. Prince Samsthānaka⁷ is a type of selfishness born in the purple worthy to rank beside figures of the modern drama, of which this has at times naturally been a favourite class of character, elsewhere⁸ the intrigues of ministers are not more fully exposed than their characters and principles of action are judiciously discriminated. Among the lesser personages common in the Indian drama, two are worth noticing, as corresponding though by no means precisely to familiar types of other dramatic literatures. These are the *vidā*, the accomplished but dependent companion (both of men and women), and the *vidūṣhaka*, the humble associate (not servant) of the

prince, and the buffoon of the action.⁹ Strangely enough, he is always a Brahmin, or the pupil of a Brahmin. His humour is to be ever intent on the pleasures of a quiet life, and on that of eating in particular; his jokes are always devoid of both harm and point.

Thus, clothing itself in a diction always ornate and Di tropical, in which (as Rückert has happily expressed it) the prose is the warp and the verse the weft, in which (as Goethe says) words become allusions, allusions similes, and similes metaphors, the Indian drama essentially depended upon its literary qualities, and upon the familiar sanctity of its favourite themes, for such effect as it was able to produce. Of scenic apparatus it knew but little; the simple devices secondary to describe, and on the contrivances it resorted to for such "properties" as were required (above all, the cars of the gods and of their emissaries)¹⁰ it is useless to speculate. Propriety of costume, on the other hand, seems always to have been observed, agreeably both to the peculiarities of the Indian drama and to the habits of the Indian people.

The ministers of an art practised under such conditions could not but be regarded with respect, and spared the contempt or worse, which, except among one other great civilized people, the Greeks, has everywhere at one time or another been the actor's lot. Companies of actors seem to have been common in India at an early date, and the inductions show the players to have been regarded as respectable members of society. In later if not in earlier times individual actors enjoyed a widespread reputation,—“all the world” is acquainted with the talents of Kalalā-Kandala.¹¹ The directors, as already stated, were usually Brahmins. Female parts were in general, though not invariably, represented by females. One would like to know whether such was the case in a piece¹² where—after the fashion of more than one Western play—a crafty minister passes off his daughter as a boy, on which assumption she is all but married to a person of her own sex.

The Indian drama would, if only for purposes of comparison, be invaluable to the student of this branch of literature. But from the point of view of purely literary excellence it holds its own against all except the very foremost dramas of the world. It is, indeed, a mere phrase to call Kālidāsa the Indian Shakespeare—a title which, moreover, if intended as anything more than a synonym for poetic pre-eminence, might fairly be disputed in favour of Bābhavūti; while it would be absolutely misleading to place a dramatic literature, which, like the Indian, is the mere quintessence of the culture of a caste, by the side of one which represents the fullest development of the artistic consciousness of a people such as the Hellenes. The Indian drama cannot be described as national in the broadest and highest sense of the word; it is, in short, the drama of a literary class, though as such it exhibits many of the noblest and most refined, as well as of the most characteristic, features of Hindu religion and civilization. The ethics of the Indian drama are of a lofty character, but they are those of a scholastic system of religious philosophy, self-conscious of its completeness. To the power of Fate is occasionally ascribed a supremacy, to which gods as well as mortals must bow;¹³ but if man's present life is merely a phase in the cycle of his destinies, the highest of moral efforts at the same time points to the summit of possibilities, and self-sacrifice is the supreme condition both of individual perfection and of the progress of the world. Such conceptions as these seem at once to

enfold and to overshadow the moral life of the Indian drama. The affections and passions forming part of self it delineates with a fidelity to nature which no art can neglect; but the freedom of the picture is restricted by conditions which to us are unfamiliar and at times seem intolerable, but which it was impossible for the Indian poet's imagination to neglect. The sheer self-absorption of ambition or love appears inconceivable by the minds of any of these poets; and their social philosophy is always based on the system of caste. On the other hand, they are masters of many of the truest forms of pathos, above all of that which blends with resignation. In humour of a delicate kind they are by no means deficient, to its lower forms they are generally strangers, even in productions of a professedly comic intention. Of wit, Indian dramatic literature—though a play on words is as the breath of its nostrils—furnishes hardly any examples intelligible to Western notions.

Poetry of
the Indian
drama.

The distinctive excellence of the Indian drama is to be sought in the poetic robe which envelops it as flowers overspread the bosom of the earth in the season of spring. In its nobler productions, at least, it is never untrue to its half religious, half rural origin; it weaves the wreaths of idyllic fancies in an unbroken chain, adding to its favourite and familiar blossoms over fresh beauties from an inexhaustible garden. Nor is it unequal to depicting the grander aspects of nature in her mighty forests and on the shores of the ocean. A profound familiarity with its native literature can here alone follow its diction through a ceaseless flow of phrase and figure, listen with understanding to the hum of the bee as it hangs over the lotus, and contemplate with Śākuntalā's pious sympathy the creeper as it winds round the mango tree. But the poetic beauty of the Indian drama reveals itself in the mysterious charm of its outline, if not in its full glow, even to the untrained; nor should the study of it—for which the materials may yet increase—be left aside by any lover of literature.

CHINESE
DRAMA

Like the Indian drama, the CHINESE arose from the union of the arts of dance and song. To the ballets and pantomimes out of which it developed itself, and which have continued to flourish by the side of its more advanced forms, the Chinese ascribe a primitive antiquity of origin; many of them originally had a symbolical reference to such subjects as the harvest, and war and peace. A very ancient pantomime is said to have symbolized the conquest of China by Wou-Wang; others were of a humbler, and often of a very obscure, character. To their music the Chinese likewise attribute a great antiquity of origin.

Though some traditions declare the emperor Wan-Te (fl. about 580 A.D.) to have invented the drama, this honour is more usually given to the emperor Heun-Tsung (720 A.D.), who is likewise remembered as a radical musical reformer. Pantomimes henceforth fell into disrepute, and the history of the Chinese drama from this date is divided, with an accuracy we cannot profess to control, into four distinct periods, of each of which the plays composed in it are stated to bear the manifest impress. These are

Chrono-
logy.

I. That of the dramas composed *under the Tang dynasty, from 720 to 907 A.D.* These pieces, called *Tchhouen-Khi*, were limited to the representation of extraordinary events, and were therefore, in design at least, a species of heroic drama. The ensuing times of civil war interrupted the "pleasures of peace and prosperity" (a Chinese phrase for dramatic performances)—which, however, revived

II. *Under the Sung Dynasty, from 960 to 1119.*—The plays of this period are called *Hi-Kho*, and presented what became a standing peculiarity of the Chinese drama, viz., that in them figures a principal personage *who sings*

III. The best known age of the Chinese drama was

under the Kin and Yuen dynasties, from 1125 to 1367. Classical The plays of this period are called *Yuen-Pen* and *Tsa-Ki*; the latter seem to have resembled the *Hi-Kho*, and to have treated very various subjects. The *Yuen-Pen* are the plays from which our literary knowledge of the Chinese drama is mainly derived; the short pieces called *Yen-Kia* were in the same style, but briefer. The list of dramatic authors under the Yuen dynasty is tolerably extensive, comprising 85, among whom four are designated as courtesans; the number of plays composed by these and by anonymous authors is reckoned at not less than 564. In 1735 the Jesuit missionary Prémare first revealed to Europe the existence of the tragedy *Tchao-Chu-Cu-Eul* (*The Little Orphan of the House of Tchao*), which was founded upon an earlier piece treating of the fortunes of an heir to the imperial throne, who was preserved in a mysterious box like another Cypselus or Moses. Voltaire seized the theme of the earlier play for a rhetorical tragedy, in which he coolly professes it was his intention "to paint the manners of the Chinese and the Tartars." The later play, which is something less elevated in the rank of its characters, and very decidedly less refined in treatment, was afterwards retranslated by Stanislas Julien; and to the labours of this scholar, of Sir J. F. Davis, and of Bazin the elder, we owe a series of translated Chinese dramas, among which there can be no hesitation whatever in designating the master-piece. The justly famous *Pi-Pa-Ki* (*The Story of the Lute*) belongs to a period rather later than that of the Yuen plays, having been composed towards the close of the 14th century by Kao-Tong-Kia, and reproduced in 1404, under the Ming dynasty, with the alterations of Mao-Tsen, a commentator of learning and taste. *Pi-Pa-Ki*, which as a domestic drama of sentiment possesses very high merit, long enjoyed a quite exceptional popularity in China, it was repeatedly republished with laudatory prefaces, and so late as the 18th century was regarded as a monument of morality, and as the master-piece of the Chinese theatre. It would seem to have remained without any worthy competitors, for although it had been originally designed to produce a reaction against the immorality of the drama then in fashion, especially of Wang-Chi-Fou's celebrated *Si-Siang-Ki* (*The Story of the Western Pavilion*), yet

IV. The period of the Chinese drama *under the Ming dynasty, from 1368 to 1644*, exhibited no improvement decay "What" (says the preface to the 1704 edition of *Pi-Pa-Ki*) "do you find there? Farcical dialogue, a mass of scenes in which one fancies one hears the hubbub of the streets or the ignoble language of the highways, the extravagances of demons and spirits, in addition to love-trigues repugnant to delicacy of manners" Nor would it appear that the Chinese theatre has ever recovered from its decay.

In theory, no drama could be more consistently elevated in purpose and in tone than the Chinese. Every play, we learn, should have both a moral and a meaning. A virtuous aim is imposed upon Chinese dramatists by an article of the penal code of the empire; and those who write immoral plays are to expect after death a purgatory which will last so long as these plays continue to be performed. In practice, however, the Chinese drama falls far short of its ideal, indeed, according to the native critic already cited, among ten thousand playwrights not one is to be found intent upon perfecting the education of mankind by means of precepts and examples.

The Chinese are, like the Hindus, unacquainted with the distinction between tragedy and comedy; they classify their plays according to subjects in twelve categories. It may be doubted whether what seems the highest of these is actually such; for the religious element in the Chinese drama is often sheer buffoonery. Moreover, Chinese

religious life as reflected in the drama seems one in which creed elbows creed, and superstitions are welcome whatever their origin. Of all religious traditions and doctrines, however, those of Buddhism (which had reached China long before the known beginnings of its drama) are the most perceptible; thus, the theme of absolute self sacrifice is treated in one play,¹ that of entire absorption in the religious life in another.² The historical drama is not unknown to the Chinese; and although a law prohibits the bringing on the stage of "emperors, empresses, and the famous princes, ministers, and generals of former ages," no such restriction is observed in practice. In *Han-Kong-Tseu* (*The Sorrows of Han*), for instance, which treats a national historic legend strangely recalling in parts the story of Esther and the myth of the daughter of Erechthens, the Emperor Yuen-Ti (the representative, to be sure, of a fallen dynasty) plays a part, and a sufficiently sorry one. By far the greater number, however, of the Chinese plays accessible in translations belong to the domestic species, and to that sub-species which may be called the criminal drama. Their favourite virtue is piety, of a formal³ or a practical⁴ kind, to parents or parents-in-law, their favourite interest lies in the discovery of long-hidden guilt, and in the vindication of persecuted innocence.⁵ In the choice and elaboration of such subjects they leave little to be desired by the most ardent devotees of the literature of agony. Besides this description of plays, we have at least one love-comedy pure and simple—a piece of a nature not "tolerably mild," but ineffably harmless.⁶

Free in its choice of themes, the Chinese drama is likewise remarkably unrestricted in its range of characters. Chinese society, it is well known, is not based, like Indian, upon the principle of caste, rank is in China determined by office, and thus again depends on the results of examination. These familiar facts are constantly brought home to the reader of Chinese plays. The *Tchoang-Yuen*, or senior classman on the list of licentiates, is the flower of Chinese society, and the hero of many a drama;⁷ and it is a proud boast that for years "one's ancestors have held high posts, which they owed to their literary successes."⁸ On the other hand, a person who has failed in his military examination, becomes, as if by a natural transition, a man-eating monster.⁹ But of mere class the Chinese drama is no respecter, painting with noteworthy freedom the virtues and the vices of nearly every phase of society. The same liberty is taken with regard to the female sex: it is clear that in earlier times there were few vexatious restrictions in Chinese life upon the social intercourse between men and women. The variety of female characters in the Chinese drama is great, ranging from the heroine who sacrifices herself for the sake of an empire¹⁰ to the well brought-up young lady who avers that "woman came into the world to be obedient, to unravel skeins of silk, and to work with her needle"¹¹—from the chambermaid who contrives the most gently sentimental of *rendezvous*,¹² to the reckless courtesan who, like another Millwood, upbraids the partner of her guilt on his suing for mercy, and bids him die with her in hopes of a re-union after death.¹³ In marriage the first or legitimate wife is distinguished from the second, who is at times a *ci-devant* courtesan, and

towards whom the feelings of the former vary between bitter jealousy¹⁴ and sisterly kindness.¹⁵

The conduct of the plays exhibits much ingenuity, and an aversion from restrictions of time and place; in fact, the nature of the plot constantly covers a long series of years, and spans wide intervals of local distance. The plays are divided into acts and scenes—the former being usually four in number, at times with an induction or narrative prologue spoken by some of the characters (*Sie-Tsen*). Favourite plays were, however, allowed to extend to great length; the *Pi-Pa-Ki* is divided into 24 sections, and in another recension apparently comprised 42. "I do not wish," says the manager in the prologue, "that this performance should last too long, finish it to-day, but cut out nothing,"—whence it appears that the performance of some plays occupied more than a single day. The rule was always observed that a separate act should be given up to the *dénouement*; while, according to a theory of which it is not always easy to trace the operation, the perfection of construction was sought in the dualism or contrast of scene and scene, just as the perfection of diction was placed in the parallelism or antithesis of phrase and phrase. Being subject to no restrictions as to what might, or might not, be represented on the stage, the conduct of the plots allowed of the introduction of almost every variety of incidents. Death takes place, in sight of the audience, by starvation,¹⁶ by drowning,¹⁷ by poison,¹⁸ by execution,¹⁹ flogging and torture are inflicted on the stage;²⁰ wonders are wrought,²¹ and magic is brought into play,²² the ghost of an innocently-executed daughter calls upon her father to revenge her foul murder, and assists in person at the subsequent judicial enquiry.²³ Certain peculiarities in the conduct of the business are due to the usages of society rather than to dramatic laws. Marriages are generally managed—at least in the higher spheres of society—by ladies professionally employed as matrimonial agents.²⁴ The happy resolution of the *nodus* of the action is usually brought about by the direct interposition of superior official authority²⁵—a tribute to the paternal system of government, which is the characteristic Chinese variety of the *deus ex machina*. This naturally tends to the favourite close of a glorification of the emperor,²⁶ resembling that of Louis XIV. at the end of *Tartuffe*, or in spirit, at all events, those of the Virgin Queen in more than one Elizabethan play. It should be added that the characters save the necessity for a bill of the play by persistently announcing and re-announcing their names and genealogies, and the necessity for a book by frequently recapitulating the previous course of the plot.

One peculiarity of the Chinese drama remains to be noticed. The chief character of a play represents the author as well as the personage, he or she is hero or heroine and chorus in one. This is brought about by the hero's (or heroine's) *singing* the poetical passages, or those containing maxims of wisdom and morality, or reminiscences and examples drawn from legend or history. Arising out of the dialogue, these passages at the same time diversify it, and give to it such elevation and brilliancy as it can boast. The singing character must be the principal personage in the action, but may be taken from any class of society. If this personage dies in the course of the play, another sings in his place. From the mention of this distinctive feature of the Chinese drama it will be obvious how unfair it would be to judge of any of its productions without a duo appre-

ciation of the lyric passages, which do not appear to be altogether restricted to the singing of the principal personage, for other characters frequently "recite verses." In these lyrical or didactic passages are to be sought those flowers of diction which, as Julien has shown, consist partly in the use of a metaphorical phraseology of infinite nicety in its variations—such as a long series of phrases compounded with the word signifying *jet* and expressing severally the ideas of rarity, distinction, beauty, &c., or as others derived from the names of colours, birds, beasts, precious metals, elements, constellations, &c., or alluding to favourite legends or anecdotes. These features constitute the literary element *par excellence* of Chinese dramatic composition. At the same time, though it is impossible for the untrained reader to be alive to the charms of so unfamiliar a phraseology, it may be questioned whether even in its diction the Chinese drama can claim to be regarded as really poetic. It may abound in poetic ornament; it is not, like the Indian, bathed in poetry.

Merits of
the Chinese
drama.

On the other hand, the merits of this dramatic literature are by no means restricted to ingenuity of construction and variety of character—merits, in themselves important, which no candid criticism will deny to it. Its master-piece is not only truly pathetic in the conception and the main situations of its action, but includes scenes of singular grace and delicacy of treatment—such as that where the re-married husband of the deserted heroine in vain essays in the presence of his second wife to sing to his new lute, now that he has cast aside the old.¹ In the last act of a tragedy appealing at once to patriotism and to pity, there is true imaginative power in the picture of the emperor, when aware of the departure but not of the death of his beloved, sitting in solitude broken only by the ominous shriek of the wild fowl.² Nor is the Chinese drama devoid of humour. The lively abigail who has to persuade her mistress into confessing herself in love by arguing (almost like Beatrice) that "humanity bids us love men,"³ the corrupt judge (a standing type of the Chinese plays) who falls on his knees before the prosecuting parties to a suit as before "the father and mother who give him sustenance,"⁴ may serve as examples; and in *Pi-Pa-Ki* there is a scene of admirable burlesque on the still more characteristic theme of the humours of a competitive examination.⁵ If such illustrations could not easily be multiplied, they are at least worth citing in order to deprecate a perfunctory criticism on the qualities of a dramatic literature as to which our materials for judgment are still scanty.

Scenery and
costume.

While in the north of China houses are temporarily set apart for dramatic performances, in the south these are usually confined to theatres erected in the streets (*Hi-Thai*). Thus scenic decorations of any importance must always have been out of question in the Chinese theatre. The costumes, on the other hand, are described as magnificent, they are traditionally those worn before the 17th century, in accordance with the historical colouring of most of the plays. The actor's profession is not a respectable one in China, the managers being in the habit of buying children of slaves and bringing them up as slaves of their own. Women may not appear on the stage, since the emperor Khien-Long admitted an actress among his concubines, female parts are therefore played by lads, occasionally by eunuchs.

Actors.

JAPANESE
DRAMA.

The JAPANESE drama, as all evidence seems to agree in showing, still remains what in substance it has always

been—an amusement passionately loved by the lower orders, but dignified by no literature deserving the name. Apart from its native elements of music, dance, and song, and legendary or historical narrative and pantomime, it is clearly to be regarded as a Chinese importation; nor has it in its more advanced forms apparently even attempted to emancipate itself from the reproduction of the conventional Chinese types. As early as the close of the 6th century Hada Kawatsu, a man of Chinese extraction, but born in Japan, is said to have been ordered to arrange entertainments for the benefit of the country, and to have written as many as thirty-three plays. The Japanese, however, ascribe the origin of their drama to the introduction of the dance called *Sambaso* as a charm against a volcanic depression of the earth which occurred in 805; and this dance appears still to be used as a prelude to theatrical exhibitions. In 1108 lived a woman called Iso no Zenji, who is looked upon as "the mother of the Japanese drama." But her performances seem to have been confined to dancing or posturing in male attire (*otokomai*), and the introduction of the drama proper is universally attributed to Saruwaka Kanzaburô, who in 1624 opened the first theatre (*sibara*) at Yeddo. Not long afterwards (1651) the play-houses were removed to their present site in the capital; and both here and in the provincial towns, especially of the north, the drama has since continued to flourish. Persons of rank are never seen at these theatres; but actors are occasionally engaged to play in private at the houses of the nobles, who appear formerly themselves to have taken part in performances of a species of opera affected by them, always treating patriotic legends and called *no*. The Mikado only has a court theatre.

The subjects of the popular plays are to a large extent historical, though the names of the characters are changed Chinshingura. An example is to be found in the *jôkuri*, or musical romance, in which the universally popular tale of *Chushingura* (*The Loyal League*) has been amplified and adapted for theatrical representation. This famous narrative of the feudal fidelity of the forty-seven *rouins*, who about the year 1699 revenged their chief's judicial suicide upon the arrogant official to whom it was due, is stirring rather than touching in its incidents, and contains much bloodshed, together with a tea-house scene which suffices as a specimen of the Japanese comedy of manners. One of the books of this dramatic romance consists of a metrical description, mainly in dialogue, of a journey which (after the fashion of Indian plays) has to be performed on the stage. Other popular plays are mentioned dealing with similar themes, besides which there are domestic dramas of a very realistic kind, and often highly improper, though all intrigues against married women are excluded. Fairy—and demon—operas and ballets, and farces and *intermezzos* form an easy transition to the interludes of tumblers and jugglers. As a specimen of nearly every class is required to make up a Japanese theatrical entertainment—which lasts from sunrise to sunset—and as the lower houses appropriate and mutilate the plays of the higher, it is clear that the condition of the Japanese theatre cannot be regarded as promising. In respect, however, of its movable scenery and properties, it is stated to be in advance of its Chinese prototype. The performers are, except in the ballet, males only. Though the leading actors enjoy great popularity and very respectable salaries, the class is held in contempt, and the companies were formerly recruited from the lowest sources. The disabilities under which they lay have, however, been removed, nor is it impossible that the reign of progress in Japan may revolutionize an agency of civilization which it seems for the present to have regarded as beneath its notice.

Absence of
drama in
rest of
Asia.

No traces of a drama exist in any of the other civilized peoples of Asia—for that in Siam may probably be regarded as a branch of the Indian. Among the Hebrews and other Semitic peoples, as well as in at least one originally Aryan people of Asia which has cultivated letters with assiduity and success—the Persians—the dramatic art is either wanting, or only appears as an occasional and exotic growth. It is unnecessary to dwell on the dramatic element apparent in two of the books of the Hebrew Scripture—the *Book of Ruth* and the *Book of Job*. Of the dramatic element in the religious rites of the Egyptians a word will be said immediately; meanwhile it may be convenient at once to state that traces of dramatic entertainments have been found in various parts of the New World, which it cannot be part of the present sketch to pursue. Among these are the performances, accompanied by dancing and intermixed with recitation and singing, of the South-Sea Islanders, first described by Captain Cook, and lately reintroduced to the notice of students of comparative mythology by Mr W. Wyatt Gill. Of the so-called Inca drama of the Peruvians, the unique relic, *Apu Ollantay*, said to have been written down in the Quichua tongue from native dictation by Spanish priests shortly after the conquest of Peru, has been partly translated by Mr Clements Markham, and recently twice rendered into German verse. It appears to be an historic play of the heroic type, combining stirring incidents with a pathos finding expression in at least one lyric of some sweetness—the lament for the lost Collyar. With it may be contrasted the ferocious Aztec dramatic ballet, *Rabinal-Achi* (translated by the Abbé de Bourbourg), of which the text seems rather a succession of warlike harangues than an attempt at dramatic treatment of character. But these are mere isolated curiosities.

Isolated
traces of it
in the

the New
World.

Dramatic
elements in
Egyptian
religious
and popular
life

The civilization and religious ideas of the EGYPTIANS so vitally influenced the people of whose drama we are about to speak that a reference to them cannot be altogether omitted. The influence of Egyptian upon Greek civilization has probably been over-estimated by Herodotus; but while it will never be clearly known how much the Greeks owed to the Egyptians in divers branches of knowledge, it is certain that the former confessed themselves the scholars of Egypt in the cardinal doctrine of its natural theology. The doctrine of the immortality of the soul there found its most solemn expression in mysterious recitations connected with the rites of sepulture, and treating of the migration of the soul from its earthly to its eternal abode. These solemnities, whose transition into the Hellenic mysteries has usually been attributed to the agency of the Thracian worship of Dionysus, undoubtedly contained a dramatic element, upon the extent of which it is, however, useless to speculate. The ideas to which they sought to give utterance centred in that of Osiris, the vivifying power or universal soul of nature, whom Herodotus simply identifies with the Dionysus of the Greeks. The same deity was likewise honoured by processions among the rural Egyptian population, which, according to the same authority, in nearly all respects except the absence of choruses resembled the Greek phallic processions in honour of the wine-god.

That the Egyptians looked upon music as an important science seems fully established, it was diligently studied by their priests, though not, as among the Greeks, forming a part of general education, and in the sacred rites of their gods they as a rule permitted the use of flute and harp, as well as of vocal music. Dancing was as an art confined to professional persons; but though the higher orders abstained from its practice, the lower indulged in it on festive occasions, when a tendency to pantomime naturally asserted itself, and licence and wanton buffoonery prevailed, as in the early rustic festivals of the Greek and Italian

peoples. Of a dance of armed men, on the other hand, there seems no satisfactory trace in the representations of the Egyptian monuments.

But whatever elements the GREEK drama may, in the sources from which it sprang, have owed to Egyptian, or Phrygian, or other Asiatic influences, its development was independent and self-sustained. Not only in its beginnings, but so long as the stage existed in Greece, the drama was in intimate connection with the national religion. This is the most signal feature of its history, and one which cannot in the same degree and to the same extent be ascribed to the drama of any other people, ancient or modern. Not only did both the great branches of the Greek drama alike originate in the usages of religious worship, but they never lost their formal union with it, though one of them (comedy) in its later growth abandoned all direct reference to its origin. Hellenic polytheism was at once so active and so fluid or flexible in its anthropomorphic formations, that no other religious system has ever so victoriously assimilated to itself foreign elements, or so vivaciously and variously developed its own. Thus, the worship of Dionysus, introduced into Greece by the Phœnicians as that of the tauroform sun-god whom his worshippers adored with loud cries (whence *Bacchus* or *Iacchus*), and the god of generation (whence his *phallic* emblem) and production, was brought into connection with the Dorian religion of the sun-god Apollo. Apollo and his sister, again, corresponded to the Pelasgian and Achaean divinities of sun and moon, whom the Phœnician Dionysus and Demeter superseded, or with whose worship theirs was blended. Dionysus, whose rites were specifically conducted with reference to his attributes as the wine-god, was attended by deified representations of his original worshippers, who wore the skin of the goat sacrificed to him. These were the *satyrs*. Out of the connected worships of Dionysus, Bacchus, Apollo, and Demeter sprang the beginnings of the Greek drama.

"Both tragedy and comedy," says Aristotle, "originated in a rude and unpremeditated manner,—the first from the leaders of the dithyramb, and the second from those who led off the phallic songs." This diversity of origin, and the distinction jealously maintained down to the latest times between the two branches of the dramatic art, even where they might seem to come into actual contact with one another, necessitate a separate statement as to the origin and history of either.

The custom of offering thanks to the gods by hymns and dances in the places of public resort was first practised by the Greeks in the Dorian states, whose whole system of life was organized on a military basis. Hence the dances of the Dorians originally taught or imitated the movements of soldiers, and their hymns were warlike chants. Such were the beginnings of the *chorus*, and of its songs (called *pæans*, from an epithet of Apollo), accompanied first by the phorminx and then by the flute. A step in advance was taken when the poet with his trained singers and dancers, like the Indian *sûtra-dhâra*, performed these religious functions as the representative of the population. From the Doric *pæan* at a very early period several styles of choral dancing formed themselves, to which the three styles of dance in scenic productions—the tragic, the comic, and the satyric—are stated afterwards to have corresponded. But none of these could have led to a literary growth. This was due to the introduction among the Dorians of the *dithyramb*,—originally a song of revellers, probably led by a flute-player and accompanied by the music of other Eastern instruments, in which it was customary in Crete to celebrate the birth of Bacchus (the doubly-born) and possibly also his later adventures. The leader of the band

Origin
tragedy.

Lyrical
tragedy.

(*coryphæus*) may be supposed to have at times assumed the character of the wine-god, whose worshippers bore aloft the vine-clad *thyrsus*. The dithyramb was reduced to a definite form by the Lesbian Arion (fl. 610), who composed regular poems, turned the moving band of worshippers into a standing or *cyclic* chorus, invented a style of music adapted to the character of the chorus—the *tragic* or goat style—and called these songs goat-songs, or *tragædiæ*. Arion thus became the inventor of *lyrical tragedy*—a transition stage between the dithyramb and the regular drama. His invention, or the chorus with which it dealt, was *established* according to fixed rules by his contemporary Stesichorus. About the same time that Arion introduced these improvements into the Dorian city of Corinth, the (likewise Dorian) Families at Sicyon honoured the hero-king Adrastus by tragic choruses. Hence the invention of tragedy was ascribed by the Sicyonians to their poet Epigenes; but this step, significant for the future history of the Greek drama, of employing the Bacchic chorus for the celebration of other than Bacchic themes, was soon annulled by the tyrant Clisthenes.

The element which transformed lyrical tragedy into the tragic drama was added by the Ionians. The custom of the recitation of poetry by wandering minstrels called *rhapsodes* (from *ῥάβδος*, staff, or from *ῥάπτω*, to piece together) first sprang up in the Ionia beyond the sea; to such minstrels was due the spread of the Homeric poems and of subsequent epic cycles. These recitations, with or without musical accompaniment, soon included gnomic or didactic, as well as epic, verse, if Homer was a rhapsode, so was the sententious or "moral" Hesiod. The popular effect of these recitations was enormously increased by the metrical innovations of Archilochus (from 708), who invented the trochee and the *iambus*, the latter the arrowy metre which is the native form of satirical invective—the species of composition in which Archilochus excelled—though it was soon used for other purposes also. The recitation of these iambs may already have nearly approached to theatrical declamation. The rhapsodes were welcome guests at popular festivals, where they exercised their art in mutual emulation, or ultimately recited parts, perhaps the whole, of longer poems. The recitation of a long epic may thus have resembled theatrical dialogue; that of alternating iambic poems, the form being frequently an address in the second person, even more so. The rhapsode was in some sense an actor, and when these recitations reached Attica, they thus brought with them the germs of theatrical dialogue.

Invention
of the
tragic
drama.

The rhapsodes were actually introduced into Attica at a very early period, the *Ilia*, we know, was chanted at the Brauronia, a rural festival of Bacchus, whose worship had early entered Attica, and was cherished among its rustic population. Meanwhile the cyclic chorus of the Dorians had found its way into Attica and Athens, ever since the Athenians had recognized the authority of the great centre of the Apolline religion at Delphi. It therefore only remained for the rhapsodic and the cyclic—in other words, for the epic and the choral—elements to coalesce; and this must have been brought about by a union of the two accompaniments of religious worship in the festive rites of Bacchus, and by the domestication of these rites in the ruling city. This occurred in the time of Pisistratus, perhaps after his restoration in 554. To Thespis (535), said to have been a contemporary of the tyrant and a native of a Diacrian deme (Icaria), the invention of tragedy is accordingly ascribed. Whether his name be that of an actual person or not, his claim to be regarded as the inventor of tragedy is founded on the statement that he introduced an actor for the sake of relieving the Dionysian chorus. This actor, the representative of the rhapsodes,

and doubtless, at first, generally the poet himself, instead of merely alternating his recitations with the songs of the chorus, addressed his speech to its leader—the *coryphæus*—with whom he thus carried on a species of *dialogue*. The chorus stood round its leader upon the steps of the Bacchic altar (*thymele*), the actor was placed upon a table. This table is the predecessor of the stage, for the waggon of Thespis is a fiction, probably due to a confusion between his table and the waggon of Susarion. It is a significant minor invention ascribed to Thespis, that he disguised the actor's face first by means of a pigment, afterwards by a mask. In the dialogue was treated a myth relating to Bacchus or some other deity or hero. Whether or not Thespis actually wrote tragedies (and there seems no reason to doubt it), and although both the cyclic chorus and rhapsodic recitation continued in separate use, tragedy was now in existence. The essential additions afterwards made to its simple framework were remarkably few. Æschylus added a second actor, and by reducing the functions of the chorus further established the dialogue as the principal part of the action. Sophocles added a third actor, by which change the preponderance of the dialogue was made complete.

If the origin of Greek comedy is simpler in its nature than that of Greek tragedy, the beginnings of its progress are involved in more obscurity. It is said to have been invented by Susarion, a native of Megaris, whose inhabitants were famed for their coarse humour, which they communicated to their colonies in Sicily. In this island, to this day the home of spontaneous mimicry, comedy was said to have arisen. In the rural Bacchic vintage-festivals bands of jolly companions (*κόμος*, properly a revel continued after supper) went about in carts or afoot, carrying the phallic emblem, and indulging in the ribald licence of wanton mirth. From the song sung in these processions or at the Bacchic feasts, which combined the praise of the god with gross personal ridicule, and was called *komos* in a secondary sense, the Bacchic reveller taking part in it was called a *komus-singer* or *komoides*. These phallic processions, which were afterwards held at Athens as in all Greek cities, imparted their character to Old Attic comedy, whose essence was personal vilification.

Thus independent of one another in their origin, Greek tragedy and comedy never actually coalesced. The *satyr-drama*, though in some sense it partook of the nature of both, was in its origin as in its history connected with tragedy alone. Pratinas of Phlius, a contemporary of Æschylus in his earlier days, is said to have restored the tragic chorus to the satyr, i.e., he first produced dramas the same in form and theme as the tragedies, but in which the dances were different and entirely carried on by satyrs. The tragic poets, while never writing comedies, henceforth also composed satyr-dramas; but neither tragedies nor satyr-dramas were ever written by the comic poets, and it was in conjunction with tragedies only that the satyr-dramas were performed. The theory of the Platonic Socrates, that the same man ought to be the best tragic and the best comic poet, was never exemplified in practice. The so-called *Tragico-comedy* or *tragi-comedy* of later writers, thought in some of its features to have been anticipated by Euripides,¹ in form nowise differed from tragedy, it merely contained a comic element in its characters, and invariably had a happy ending. The serious and sentimental element in the comedy of Menander and his contemporaries did far more to destroy the essential difference between the two great branches of the Greek dramatic art.

The history of Greek—which virtually always remained Attic—tragedy divides itself into three periods.

Origin of
comedy.

The satyr-
drama.

Tragi-
comedy.

Periods of
Greek tra-
gedy.

¹ *Alceste Orestes*

Period
before
Æschylus.

I. *The period before Æschylus* (535-499).—From this we have but a few names of authors and plays—those of the former being (besides Thespis) Chœrilus, Phrynichus, and Pratinas, all of whom lived to contend with Æschylus for the tragic prize. To each of them certain innovations are ascribed—among the rest the introduction of female characters to Phrynichus.

Classical
period

II. *The classical period of Attic tragedy*—that of Æschylus, Sophocles, and Euripides, and their contemporaries (499-405)—To this belong all the really important phases in the progress of Greek tragedy, which severally connect themselves with the names of its three great masters. They may be regarded as the representatives of different generations of Attic history and life, though of course in these, as in the progress of their art itself, there is an unbroken continuity. Æschylus

Æschylus.

(525-456) had not only fought both at Marathon and at Salamis against those Persians whose rout he celebrated with patriotic pride,¹ but he had been trained in the Eleusinian mysteries, and was a passionate upholder of the institution most intimately associated with the primitive political traditions of the past—the Areopagus.² He had been born in the generation after Solon, to whose maxims he fondly clung; he must have belonged to that anti-democratical party which favoured the Spartan alliance, and it was the Dorian development of Hellenic life and the philosophical system based upon it with which his religious and moral convictions were imbued. Thus even upon the generation which succeeded him the chivalrous spirit and diction of his poetry, and the unapproached sublimity of his dramatic imagination, fell, as it falls upon later posterity, like the note of a mightier age. Sophocles (495-405) was the associate of Pericles, and an upholder of his authority rather than a consistent pupil of his political ideas; but his manhood and perhaps the maturity of his genius coincided with the great days when he could stand, like his mighty friend and the community they both so gloriously represented, on the sunny heights of achievement. Serenely pious, he yet treats the myths of the national religion in the spirit of a conscious artist, contrasting with lofty irony the struggles of humanity with the irresistible march of its destinies. His art (which he described as having passed through three successive stages) may in its perfection be said to typify the watchful and creative calm of his city's imperial epoch.

Euripides.

Euripides (480-406), as is the fate of genius of a more complex kind, has been more variously and antithetically judged than either of his great fellow-tragedians. His art has been called thinner and tamer than theirs, his genius rhetorical rather than poetical, his morality that of a sophistical wit. On the other hand, he has been recognized not only as the most tragic of the Attic tragedians and the most pathetic of ancient poets, but also as the most humane in his social philosophy and the most various in his psychological insight. At least though far removed from the halcyon age of the national life, he is, both in patriotic spirit and in his choice of themes, genuinely Attic; and if he was "haunted on the stage by the dæmon of Socrates," he was, like Socrates himself, the representative of an age which was a seed-time as well as a season of decay. To Euripides the general progress of dramatic literature owes more than to any other ancient poet. Tragedy followed in his footsteps in Greece and at Rome, comedy owed him something in the style of the very Aristophanes who mocked him, and more in the sentiments of Menander; and when the modern drama came to engraft the ancient upon its own crude growth, his was directly or indirectly the most powerful influence in the establishment of a living connection between them.

The incontestable pre-eminence of the three great tragic poets was acknowledged at Athens by the usage allowing no tragedies but theirs to be more than once performed, and by the law of Lycurgus (c. 330) which obliged the actors to use, in the case of works of the great masters, authentic copies preserved in the public archives. It is thus not impossible that the value of later Attic tragedy, of which the fertility continued considerable, has been under-rated. In all the names of 1400 tragedies and satyr-dramas are preserved, and tragic poets are mentioned of whose plays no names are known. Among the more celebrated Attic tragedians contemporary with the great writers, Ion of Chios (d. before 419) seems to have followed earlier traditions of style than Euripides, Agathon, who survived the latter, on the other hand, introduced certain innovations of a transnormal kind into the art of tragic composition.

III. Of the *third period* of Greek tragedy the concluding limit cannot be precisely fixed. Down to the days of Alexander the Great, Athens remained the chief home of tragedy. Though tragedies must have begun to be acted at the Syracusan and Macedonian courts, since Æschylus, Euripides, and Agathon had sojourned there,—though the practice of producing plays at the Dionysia before the allies of Athens must have led to their holding similar exhibitions at home,—yet before the death of Alexander we meet with no instance of a tragic poet writing or a tragedy written outside Athens. An exception should indeed be made in favour of the tyrant Dionysius of Syracuse, who (like Critias in his earlier days at Athens) was "addicted to" tragic composition. Not all the tragedians of this period, however, were Athenians born; though the names of Euphorion, the son of Æschylus, Iophon, the son of Sophocles, and Euripides and Sophocles, the nephew and the grandson respectively of their great namesakes, illustrate the descent of the tragic art as an hereditary family possession. Chæremón (fl. 380) already exhibits tragedy on the road to certain decay, for we learn that his plays were written for reading.

Soon after the death of Alexander theatres are found spread over the whole Hellenic world of Europe and Asia—a result to which the practice of the conqueror and his father of celebrating their victories by scenic performances had doubtless contributed. Alexandria having now become a literary centre with which even Athens was in some respects unable to compete, while the latter still remained the home of comedy, the tragic poets flocked to the capital of the Ptolemies, and here, in the reign of Ptolemy Philadelphus (283-247) flourished the seven tragic poets famed as the "Pleias," who still wrote in the style and followed the rules observed by the Attic masters. Tragedy and the dramatic art continued to be favoured by the later Ptolemies; and about 100 B.C. we meet with the curious phenomenon of a Jewish poet, Ezechiel, composing Greek tragedies, of one of which (the *Exodus* from Egypt) fragments have come down to us. Tragedy, with the satyr-drama and comedy, survived in Alexandria beyond the days of Cicero and Varro, nor was their doom finally sealed till the Emperor Caracalla abolished theatrical performances in the Egyptian capital in 217 A.D.

During the whole of its productive age Greek tragedy seems to have adhered to the lines laid down by its great Attic masters; nor were these in most respects departed from by the Roman imitators of these poets and of their successors.

Tragedy was defined by Plato as an imitation of the noblest life. Its proper themes—the deeds and sufferings of heroes—were familiar to audiences intimately acquainted with the mythology of the national religion. To such themes Greek tragedy almost wholly confined itself; and in later days there were numerous books which discussed these

¹ *Persæ*

² *Eumenides*

myths of the tragedians. They only very exceptionally treated historic themes, though one great national calamity,¹ and a yet greater national victory,² and in later times a few other historical subjects,³ were brought upon the stage. Such veiled historical allusions as critical ingenuity has sought not only in passages but in the entire themes of other Attic tragedies⁴ cannot, of course, even if accepted as such, stamp the plays in which they occur as historic dramas. No doubt Attic tragedy, though after a different and more decorous fashion, shared the tendency of her comic sister to introduce allusions to contemporary events and persons, and the indulgence of this tendency was facilitated by the revision (*διασκευή*) to which the works of the great poets were subjected by them, or by those who produced their works after them.⁵ So far as we know, the subjects of the tragedies before Æschylus were derived from the epos; and it was a famous saying of this poet that his dramas were "but dry scraps from the great banquets of Homer"—an expression which may be understood as including the poems which belong to the so-called Homeric cycles. Sophocles, Euripides, and their successors likewise resorted to the Trojan, and also to the Heracleian and the Thesean myths, and to Attic legend in general, as well as to Theban, to which already Æschylus had had recourse, and to the side or subsidiary myths connected with these several groups. These substantially remained to the last the themes of Greek tragedy, the Trojan myths always retaining so prominent a place that Lucian could jest on the universality of their dominion. Purely invented subjects were occasionally treated by the later tragedians; of this innovation Agathon was the originator.⁶

Construc-
tion.

Thespis is said to have introduced the use of a *prologue* and a *rhesis* (speech)—the former being probably the opening speech recited by this solitary actor, the latter the dialogue between actor and chorus. It was a natural result of the introduction of the second actor that a second *rhesis* should likewise be added; and this tripartite division would be the earliest form of the *trilogy*,—three sections of the same myth forming the beginning, middle, and end of a single drama, marked off from one another by the choral songs. From this Æschylus proceeded to the treatment of these several portions of a myth in three separate plays, connected together by their subject and by being performed in sequence on a single occasion. This is the *Æschylean trilogy*, of which we have only one extant example, the *Orestea*,—as to which critics may differ whether Æschylus adhered in it to his principle that the strength should lie in the middle—in other words, that the interest should centre in the second play. In any case, the symmetry of the trilogy was destroyed by the practice of performing after it a satyr-drama, probably, as a rule, if not always, connected in subject with the trilogy, which thus became a *tetralogy*, though this term, unlike the other, seems to be a purely technical expression invented by the learned.⁷

The
Æschylean
trilogy

The tetra-
logy.

¹ Phrynichus, *Capture of Miletus*

² Id., *Phonissæ*; Æschylus, *Perseus* (*Perseus-trilogy*?)

³ Moschion, *Themistocles*; Theodectes, *Marsolus*; Lycophron, *Marathon*; Cassandre, *Soni*; Philæus, *Themistocles*.

⁴ Æschylus, *Septem c. Thebas*; *Prometheus Vinctus*; *Darius-trilogy*; Sophocles, *Antigone*; *Œdipus Coloneus*; Euripides, *Mædea*.

⁵ Quite distinct from this revision was the practice again which the law of Lycurgus was directed, of "cobbling and hewing" the dramas of the great masters by alterations of a kind familiar enough to the students of Shakespeare as improved by Colley Cibber. The later tragedians also appear to have occasionally transposed long speeches or episodes from one tragedy into another—a device largely followed by the Roman dramatists, and called *contamination* by Latin writers.

⁶ *Anthos* (*The Flower*)

⁷ One satyr-drama only is preserved to us, the *Cyclops* of Euripides, a dramatic version of the Homeric tale of the visit of Odysseus to Polyphemus. Lycophron, one of the poets of the Pleias, by using the satyr-drama (in his *Menedemus*) as a vehicle of personal ridicule, applied it to a purpose like that of Old Attic comedy.

Sophocles, a more conscious and probably a more self-critical artist than Æschylus, may be assumed from the first to have elaborated his tragedies with greater care; and to this, as well as to his innovation of the third actor, which materially added to the fulness of the action, we may attribute his introduction of the custom of contending for the prize with single plays. It does not follow that he never produced connected trilogies, though we have no example of such by him or any later author; on the other hand, there is no proof that either he or any of his successors ever departed from the Æschylean rule of producing three tragedies, followed by a satyr-drama, on the same day. This remained the third and last stage in the history of the construction of Attic tragedy. The tendency of its development towards complication was a natural progress, and is elaborated and approved by Aristotle. This complication, in which Euripides excelled, led to his use of prologues, in which one of the characters opens the play by an exposition of the circumstances under which its action begins. This practice, though ridiculed by Aristophanes, was too convenient not to be adopted by the successors of Euripides, and Menander transferred it to comedy. As the dialogue increased in importance, so the dramatic significance of the chorus diminished. While in Æschylus it mostly, and in Sophocles occasionally, takes part in the action, its songs could not but more and more approach the character of lyrical interludes; and this they openly assumed when Agathon began the practice of inserting choral songs (*embolima*) which had nothing to do with the action of the play. In the general contrivance of their actions it was only natural that, as compared with Æschylus, Sophocles and Euripides should exhibit an advance in both freedom and ingenuity, but the palm due to a treatment at once piously adhering to the substance of the ancient legends and original in an effective dramatic treatment of them must be given to Sophocles. Euripides was, moreover, less skilful in untying complicated actions than in wearing them; hence his frequent resort to the expedient of the *deus ex machina*, which Sophocles employs only in his latest play.⁸

The other distinctions to be drawn between the dramatic qualities of the three great tragic masters must be mainly based upon a critical estimate of the individual genius of each. In the characters of their tragedies, Æschylus and Sophocles avoided those lapses of dignity with which from one point of view Euripides has been charged by Aristophanes and other critics, but which from another connect themselves with his humanity. If his men and women are less heroic and statuerque, they are more like men and women. Aristotle objected to the later tragedians that, compared with the great masters, they were deficient in the drawing of character—by which he meant the lofty drawing of lofty character. In diction, the transition is even more perceptible from the "helmeted phrases" of Æschylus, who had Milton's love of long words and sonorous proper names, to the play of Euripides's "smooth and diligent tongue;" but to a sustained style even he remained essentially true, and it was reserved for his successors to introduce into tragedy the "low speech"—i.e., the conversational language—of comedy. Upon the whole, however, the Euripidean diction seems to have remained the standard of later tragedy, the flowery style of speech introduced by Agathon finding no permanent favour.

Finally, Æschylus is said to have made certain reforms in tragic costume of which the object is self-evident,—to have improved the mask, and to have invented the *cothurnus* or buskin, upon which the actor was raised to

⁸ *Ion*; *Suppliants*; *Iphigenia in Tauris*, *Electra*, *Helena*, *Hippolytus*; *Andromache*.

⁹ *Philæetes*.

loftier stature. Euripides was not afraid of rags and tatters; but the sarcasms of Aristophanes on this head seem feeble to those who are aware that they would apply to King Lear as well as to Telephus.

Periods of
Greek
comedy.
Sicilian
comedy.

The history of Greek comedy is likewise that of an essentially Attic growth, although Sicilian comedy was earlier in date than her Attic sister or descendant. The former is represented by Epicharmus (fl. 500), and by the names of one or two other poets. It probably had a chorus, and, dealing as it did in a mixture of philosophical discourse, antithetical rhetoric, and wild buffoonery, necessarily varied in style. Though in some respects it seems to have resembled the Middle rather than the Old Attic comedy, its subjects sometimes, like those of the latter, coincided with the myths of tragedy, of which they were doubtless parodies. The so-called *mimes* of Sophron (fl. 430) were dramatic scenes from Sicilian life, intended, not for the stage, but for recitation.

Attic.
Old.

Attic comedy is usually divided into three periods or species, viz. :—

I. *Old Comedy*, which dates from the complete establishment of democracy by Pericles, though a comedy directed against Themistocles is mentioned. The Megarean farcical entertainments had long spread in the rural districts of Attica, and were now introduced into the city, where Cratinus and Crates (fl. 450) first moulded them into the forms of Attic art. The final victory of Pericles and the democratic party may be reckoned from the ostracism of Thucydides (444); and so eagerly was the season of freedom employed by the comic poets that already four years afterwards a law—which was, however, only a short time in force—limited their licence. Cratinus,¹ an exceedingly bold and broad satirist, apparently of conservative tendencies, was followed by Eupolis (446–after 415), every one of whose plays appears to have attacked some individual,² by Phrynichus, and others; but the representative of old comedy in its fullest development is Aristophanes (c. 444–c. 380), a comic poet of unique and unsurpassed genius. Dignified by the acquisition of a chorus (though of a less costly kind than the tragic) of masked actors, and of scenery and machinery, and by a corresponding literary elaboration and elegance of style, Old Attic comedy nevertheless remained true both to its origin and to the purposes of its introduction into the free imperial city. It borrowed much from tragedy, but it retained the phallic abandonment of the old rural festivals, the licence of word and gesture, and the audacious directness of personal invective. These characteristics are not features peculiar to

Aristophanes

Aristophanes. He was twitted by some of the older comic poets with having degenerated from the full freedom of the art by a tendency to refinement, and he took credit to himself for having superseded the time-honoured *cancan* and the stale practical joking of his predecessors by a nobler kind of mirth. But in boldness, as he likewise boasted, he had no peer; and the shafts of his wit, though dipped in wine-les and at times feathered from very obscene fowl, flew at high game.³ He has been accused of seeking to degrade what he ought to have recognized as good;⁴ and it has been shown with complete success that he is not to be taken as an impartial or accurate authority on Athenian history. But partisan as he was, he was also a genuine patriot; and his very political sympathies—which were conservative—were such as have often stimulated the most effective political satire, because they imply an antipathy to every species of excess. Of the conservative quality of reverence he was, however, altogether devoid; and his

love for Athens was that of the most free-spoken of sons. Flexible even in his religious notions, he was in this as in other respects ready to be educated by his times; and, like a true comic poet, he could be witty at the expense even of his friends, and, it might almost be said, of himself. In wealth of fancy,⁵ and in beauty of lyric melody, he ranks high among the great poets of all times.

The distinctive feature of Old, as compared with Middle Comedy, is the *parabasis*, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play. The loss of the *parabasis* was involved in the loss of the chorus, of which comedy was deprived in consequence of the general reduction of expenditure upon the comic drama, culminating in the law of Cinesias (396).⁶ But with the downfall of the independence of Athenian public life, the ground had been cut from under the feet of its most characteristic representative. The catastrophe of the city (405) had been preceded by the temporary overthrow of the democracy (411), and was followed by the establishment of an oligarchical “tyranny” under Spartan protection; and when liberty was restored (404), the citizens for a time addressed themselves to their new life in a soberer spirit and continued (or passed) the law prohibiting the introduction by name of any individual as one of the personages of a play. The change to which comedy had to accommodate itself was one which cannot be defined by precise dates, yet it was not the less inevitable in its progress and results. Comedy, in her struggle for existence, now chiefly devoted herself to literary and social themes—such as the criticism of tragic poets,⁷ and the literary craze of women’s rights⁸—and the transition to Middle Comedy accomplished itself. Of the later plays of Aristophanes, three⁹ are without a *parabasis*, and in the last of those preserved to us¹⁰ the chorus is quite insignificant.

II. *Middle Comedy*, whose period extends over the remaining years of Athenian freedom, thus differed in substance as well as in form from its predecessor. It is represented by the names of thirty-seven writers (more than double the number of poets attributed to Old Comedy) among whom Eubulus, Antiphanes, and Alexis are stated to have been pre-eminently fertile and successful. It was a comedy of manners as well as character, although its ridicule of particular classes of men tended to the creation of standing types, such as parasites, courtesans, revellers, and—a favourite figure already drawn by Aristophanes¹¹—the self-conceited cook. In style it necessarily inclined to become more easy and conversational; while in that branch which was devoted to the parodying of tragic myths, its purpose may have been to criticise, but its effect must have been to degrade. This species of the comic art had found favour at Athens already before the close of the great civil war; its inventor was the Thasian Hegemon, at whose *Gigantomachia* the Athenians were laughing on the day when the news arrived of the Sicilian disaster.

III. *New Comedy*, which is dated from the establishment of the Macedonian supremacy (338) is merely a further development of *Middle*. If its favourite types were more numerous, including the captain (of mercenaries)—the original of a long line of comic favourites—the cunning slave, &c., they were probably also more conventional. New Comedy appears to have first constituted love intrigues the main subject of dramatic actions. The most famous of the 64 writers said to have belonged to this period of comedy were Philemon (fl. from 330), Menander (342–29),¹²

myths of the tragedians. They only very exceptionally treated historic themes, though one great national calamity,¹ and a yet greater national victory,² and in later times a few other historical subjects,³ were brought upon the stage. Such veiled historical allusions as critical ingenuity has sought not only in passages but in the entire themes of other Attic tragedies⁴ cannot, of course, even if accepted as such, stamp the plays in which they occur as historic dramas. No doubt Attic tragedy, though after a different and more decorous fashion, shared the tendency of her comic sister to introduce allusions to contemporary events and persons; and the indulgence of this tendency was facilitated by the revision (*διασκευή*) to which the works of the great poets were subjected by them, or by those who produced their works after them.⁵ So far as we know, the subjects of the tragedies before Æschylus were derived from the epos; and it was a famous saying of this poet that his dramas were "but dry scraps from the great banquets of Homer"—an expression which may be understood as including the poems which belong to the so-called Homeric cycles. Sophocles, Euripides, and their successors likewise resorted to the Trojan, and also to the Heracleian and the Thesean myths, and to Attic legend in general, as well as to Theban, to which already Æschylus had had recourse, and to the side or subsidiary myths connected with these several groups. These substantially remained to the last the themes of Greek tragedy, the Trojan myths always retaining so prominent a place that Lucian could jest on the universality of their dominion. Purely invented subjects were occasionally treated by the later tragedians; of this innovation Agathon was the originator.⁶

Construc-
tion.

Thespis is said to have introduced the use of a *prologue* and a *rhesis* (speech)—the former being probably the opening speech recited by this solitary actor, the latter the dialogue between actor and chorus. It was a natural result of the introduction of the second actor that a second *rhesis* should likewise be added; and this tripartite division would be the earliest form of the *trilogy*,—three sections of the same myth forming the beginning, middle, and end of a single drama, marked off from one another by the choral songs. From this Æschylus proceeded to the treatment of these several portions of a myth in three separate plays, connected together by their subject and by being performed in sequence on a single occasion. This is the *Æschylean trilogy*, of which we have only one extant example, the *Oresteia*,—as to which critics may differ whether Æschylus adhered in it to his principle that the strength should lie in the middle—in other words, that the interest should centre in the second play. In any case, the symmetry of the trilogy was destroyed by the practice of performing after it a satyr-drama, probably, as a rule, if not always, connected in subject with the trilogy, which thus became a *tetralogy*, though this term, unlike the other, seems to be a purely technical expression invented by the learned.⁷

⁵ Quite distinct from this revision was the practice against which the law of Lycurgus was directed, of "cobbling and heeling" the dramas of the great masters by alterations of a kind familiar enough to the students of Shakespeare as improved by Colley Cibber. The later tragedians also appear to have occasionally transposed long speeches or episodes from one tragedy into another—a device largely followed by the Roman dramatists, and called *contamination* by Latin writers.

⁶ Anthos (*The Flower*).

⁷ One satyr-drama only is preserved to us, the *Cyclops* of Euripides, a dramatic version of the Homeric tale of the visit of Odysseus to Polyphemus. Lycophron, one of the poets of the Pleias, by using the satyr-drama (in his *Menedemus*) as a vehicle of personal ridicule, applied it to a purpose like that of Old Attic comedy.

Sophocles, a more conscious and probably a more self-critical artist than Æschylus, may be assumed from the first to have elaborated his tragedies with greater care; and to this, as well as to his innovation of the third actor, which materially added to the fulness of the action, we may attribute his introduction of the custom of contending for the prize with single plays. It does not follow that he never produced connected trilogies, though we have no example of such by him or any later author; on the other hand, there is no proof that either he or any of his successors ever departed from the Æschylean rule of producing three tragedies, followed by a satyr-drama, on the same day. This remained the third and last stage in the history of the construction of Attic tragedy. The tendency of its action towards complication was a natural progress, and is approved by Aristotle. This complication, in which Euripides excelled, led to his use of prologues, in which one of the characters opens the play by an exposition of the circumstances under which its action begins. This practice, though ridiculed by Aristophanes, was too convenient not to be adopted by the successors of Euripides, and Menander transferred it to comedy. As the dialogue increased in importance, so the dramatic significance of the chorus diminished. While in Æschylus it mostly, and in Sophocles occasionally, takes part in the action, its songs could not but more and more approach the character of lyrical *intermezzi*; and this they openly assumed when Agathon began the practice of inserting choral songs (*embolima*) which had nothing to do with the action of the play. In the general contrivance of their actions it was only natural that, as compared with Æschylus, Sophocles and Euripides should exhibit an advance in both freedom and ingenuity; but the palm due to a treatment at once piously adhering to the substance of the ancient legends and original in an effective dramatic treatment of them must be given to Sophocles. Euripides was, moreover, less skilful in untying complicated actions than in weaving them; hence his frequent resort to the expedient of the *deus ex machina*, which Sophocles employs only in his latest play.⁸

Complicated
actions

The other distinctions to be drawn between the dramatic qualities of the three great tragic masters must be mainly based upon a critical estimate of the individual genius of each. In the characters of their tragedies, Æschylus and Sophocles avoided those lapses of dignity with which from one point of view Euripides has been charged by Aristophanes and other critics, but which from another connect themselves with his humanity. If his men and women are less heroic and statue-like, they are more like men and women. Aristotle objected to the later tragedians that, compared with the great masters, they were deficient in the drawing of character—by which he meant the lofty drawing of lofty character. In diction, the transition is even more perceptible from the "helmeted phrases" of Æschylus, who had Milton's love of long words and sonorous proper names, to the play of Euripides's "smooth and diligent tongue;" but to a sustained style even he remained essentially true, and it was reserved for his successors to introduce into tragedy the "low speech"—i.e., the conversational language—of comedy. Upon the whole, however, the Euripidean diction seems to have remained the standard of later tragedy, the flowery style of speech introduced by Agathon finding no permanent favour.

Diction

Finally, Æschylus is said to have made certain reforms in tragic costume of which the object is self-evident,—to have improved the mask, and to have invented the *cothurnus* or buskin, upon which the actor was raised to

loftier stature. Euripides was not afraid of rags and tatters; but the sarcasms of Aristophanes on this head seem feeble to those who are aware that they would apply to King Lear as well as to Telephus.

Periods of
Greek
comedy.

Sicilian
comedy.

The history of Greek comedy is likewise that of an essentially Attic growth, although Sicilian comedy was earlier in date than her Attic sister or descendant. The former is represented by Epicharmus (fl. 500), and by the names of one or two other poets. It probably had a chorus, and, dealing as it did in a mixture of philosophical discourse, antithetical rhetoric, and wild buffoonery, necessarily varied in style. Though in some respects it seems to have resembled the Middle rather than the Old Attic comedy, its subjects sometimes, like those of the latter, coincided with the myths of tragedy, of which they were doubtless parodies. The so-called *mimes* of Sophron (fl. 430) were dramatic scenes from Sicilian life, intended, not for the stage, but for recitation.

Attic

Old.

Attic comedy is usually divided into three periods or species, viz. :—

I. *Old Comedy*, which dates from the complete establishment of democracy by Pericles, though a comedy directed against Themistocles is mentioned. The Megarean farcical entertainments had long spread in the rural districts of Attica, and were now introduced into the city, where Cratinus and Crates (fl. 450) first moulded them into the forms of Attic art. The final victory of Pericles and the democratic party may be reckoned from the ostracism of Thucydides (444), and so eagerly was the season of freedom employed by the comic poets that already four years afterwards a law—which was, however, only a short time in force—limited their licence. Cratinus,¹ an exceedingly bold and broad satirist, apparently of conservative tendencies, was followed by Eupolis (446–after 415), every one of whose plays appears to have attacked some individual,² by Phrynichus, and others; but the representative of old comedy in its fullest development is Aristophanes (c. 444–c. 380), a comic poet of unique and unsurpassed genius. Dignified by the acquisition of a chorus (though of a less costly kind than the tragic) of masked actors, and of scenery and machinery, and by a corresponding literary elaboration and elegance of style, Old Attic comedy nevertheless remained true both to its origin and to the purposes of its introduction into the free imperial city. It borrowed much from tragedy, but it retained the phallic abandonment of the old rural festivals, the licence of word and gesture, and the audacious directness of personal invective. These characteristics are not features peculiar to

Aristophanes.

Aristophanes. He was twitted by some of the older comic poets with having degenerated from the full freedom of the art by a tendency to refinement, and he took credit to himself for having superseded the time-honoured *cancan* and the stale practical joking of his predecessors by a nobler kind of mirth. But in boldness, as he likewise boasted, he had no peer; and the shafts of his wit, though dipped in wine- lees and at times feathered from very obscene fowl, flew at high game.³ He has been accused of seeking to degrade what he ought to have recognized as good;⁴ and it has been shown with complete success that he is not to be taken as an impartial or accurate authority on Athenian history. But partisan as he was, he was also a genuine patriot; and his very political sympathies—which were conservative—were such as have often stimulated the most effective political satire, because they imply an antipathy to every species of excess. Of the conservative quality of reverence he was, however, altogether devoid; and his

love for Athens was that of the most free-spoken of sons. Flexible even in his religious notions, he was in this as in other respects ready to be educated by his times; and, like a true comic poet, he could be witty at the expense even of his friends, and, it might almost be said, of himself. In wealth of fancy,⁵ and in beauty of lyric melody, he ranks high among the great poets of all times.

The distinctive feature of Old, as compared with Middle Comedy, is the *parabasis*, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play. The loss of the *parabasis* was involved in the loss of the chorus, of which comedy was deprived in consequence of the general reduction of expenditure upon the comic drama, culminating in the law of Cinesias (396).⁶ But with the downfall of the independence of Athenian public life, the ground had been cut from under the feet of its most characteristic representative. The catastrophe of the city (405) had been preceded by the temporary overthrow of the democracy (411), and was followed by the establishment of an oligarchical “tyranny” under Spartan protection; and when liberty was restored (404), the citizens for a time addressed themselves to their new life in a soberer spirit and continued (or passed) the law prohibiting the introduction by name of any individual as one of the personages of a play. The change to which comedy had to accommodate itself was one which cannot be defined by precise dates, yet it was not the less inevitable in its progress and results. Comedy, in her struggle for existence, now chiefly devoted herself to literary and social themes—such as the criticism of tragic poets,⁷ and the literary craze of women’s rights⁸—and the transition to Middle Comedy accomplished itself. Of the later plays of Aristophanes, three⁹ are without a *parabasis*, and in the last of those preserved to us¹⁰ the chorus is quite insignificant.

The end
Old Comedy.

II. *Middle Comedy*, whose period extends over the Middle remaining years of Athenian freedom, thus differed in substance as well as in form from its predecessor. It is represented by the names of thirty-seven writers (more than double the number of poets attributed to Old Comedy) among whom Eubulus, Antiphanes, and Alexis are stated to have been pre-eminently fertile and successful. It was a comedy of manners as well as character, although its ridicule of particular classes of men tended to the creation of standing types, such as parasites, courtesans, revellers, and—a favourite figure already drawn by Aristophanes¹¹—the self-conceited cook. In style it necessarily inclined to become more easy and conversational; while in that branch which was devoted to the parodying of tragic myths, its purpose may have been to criticise, but its effect must have been to degrade. This species of the comic art had found favour at Athens already before the close of the great civil war; its inventor was the Thasian Hegemon, at whose *Gigantomachia* the Athenians were laughing on the day when the news arrived of the Sicilian disaster.

III. *New Comedy*, which is dated from the establishment New of the Macedonian supremacy (338) is merely a further development of *Middle*. If its favourite types were more numerous, including the captain (of mercenaries)—the original of a long line of comic favourites—the cunning slave, &c., they were probably also more conventional. New Comedy appears to have first constituted love intrigues the main subject of dramatic actions. The most famous of the 64 writers said to have belonged to this period of comedy were Philemon (fl. from 330), Menander (342–29),

and his contemporary Diphilus. Of these authors we know something from fragments, but more from their Latin adapters Plautus and Terence. As comedians of character, they were limited by a range of types which left little room for originality of treatment; in the construction of their plots they were skilful rather than varied. In style, as well as to some extent in construction, Menander took Euripides as his model, infusing into his comedy an element of moral and sentimental reflection, which refined if it did not enliven it. Yet it may be doubted whether either a high moral or a high artistic purpose animated this school of writers, and whether Epicurus in Lander's dialogue does injustice to Menander in suspecting him of "enjoying the follies of men in our rotten state as flies enjoy fruit in its decay." Fate or chance were the directing powers of his dramatic actions.

Decay of
comedy.

New Comedy, and with it Greek comedy proper, is regarded as having come to an end with Posidippus (fl. c. 280). Other comic writers of a later date are, however, mentioned, among them Rhinthon of Tarentum (fl. c. 300), whose mixed compositions have been called by various names, among them by that of *phylacographies* (from *phylax*, useless chatter). But Greek comedy ceased to be productive after it had been transplanted from Athens to Alexandria; and though even in its original form it long continued to be acted in imperial Rome, these are phases of its history which may here be passed by.

Results of
religious
origin of
Attic
drama.

The religious origin of the Attic drama impresses itself upon all its most peculiar features. Theatrical performances were held at Athens only at fixed seasons in the early part of the year—at the Bacchic festivals of the country Dionysia (vintage), the Lenæa (wine-press), probably at the Anthesteria, and above all, at the Great Dionysia, or the Dionysia *par excellence*, at the end of March and beginning of April, when in her most glorious age Athens was crowded with visitors from the islands and cities of her federal empire. As a part of religious worship, the performances took place in a sacred locality—the *Lenæum* on the south-eastern declivity of the Acropolis, where the first wine-press (*lenos*) was said to have been set up, and where now an altar of Bacchus (*thymele*) formed the centre of the theatre. For the same reason, the exhibitions claimed the attendance of the whole population, and room was therefore provided on a grand scale—according to the Platonic Socrates, for "more than 30,000" spectators. The performances lasted all day, or were at least, in accordance with their festive character, extended to as great a length as possible. To their religious origin is likewise to be attributed the fact that they were treated as a matter of state concern. The expenses of the choros, which in theory represented the people at large, were defrayed on behalf of the state by the *liturges* (public services) of wealthy citizens, chosen in turn by the tribes to be *choragi* (leaders, i.e., providers of the chorus), the duty of training being, of course, deputed by them to professional persons (*chorodidascali*). Publicly appointed and sworn judges decided between the merits of the dramas produced in competition with one another, the successful poet, performers, and choragus were crowned with ivy, and the last-named was allowed at his own expense to consecrate a tripod in memory of his victory in the neighbourhood of the sacred Bacchic enclosure. Such a monument—one of the most graceful relics of ancient Athens—still stands in the place where it was erected, and recalls to posterity the victory of Lysicrates, achieved in the same year as that of Alexander on the Granicus. The dramatic exhibitions being a matter of religion and state, the entrance money, (*theoricum*) which had been introduced to prevent overcrowding, was from the time of Pericles provided out of the public treasury. The whole population had a right to its

Bacchic holiday; neither women, nor boys, nor slaves were excluded from theatrical spectacles at Athens.

The religious character of dramatic performances at Athens, and the circumstances under which they accordingly took place, likewise determined their externals of costume and scenery. The actor's dress was originally the festive Dionysian attire, of which it always retained the gay and variegated hues. The use of the mask was due to the actor's appearing in the open air and at a distance from most of the spectators; its several species were elaborated with great care, and adapted to the different types of theatrical character. The *cothurnus*, or thick-soled boot, which further raised the height of the tragic actor (while the comedian wore a thin-soled boot), was likewise a relic of Bacchic costume. The scenery was, in the simplicity of its original conception, suited to open-air performances; but in course of time the art of scene-painting came to be highly cultivated, and movable scenes were contrived, together with machinery of the ambitious kind required by the Attic drama, whether for bringing gods down from heaven, or for raising mortals aloft.

On a stage and among surroundings thus conventional, Actors it might seem as if little scope could have been left for the actor's art. But though the demands made upon the Attic actor differed in kind even from those made upon his Roman successor, and still more from those which the histrionic art has to meet in modern times, they were not the less rigorous. Mask and buskin might increase his stature, and the former might at once lend the appropriate expression to his appearance and the necessary resonance to his voice. But in declamation, dialogue, and lyric passage, in gesticulation and movement, he had to avoid the least violation of the general harmony of the performance. At the same time, the refinements of bye-play must, from the nature of the case, have been impossible on the Attic stage; the gesticulation must have been broad and massive; the movement slow and the grouping hard in tragedy; and the recitation must have surpassed in its weighty sameness that half-chant of which the echoes have never wholly died out from the stage. Not more than three actors, as has been seen, appeared in any Attic tragedy. The actors were provided by the poet; perhaps the performer of the first parts (*protagonist*) was paid by the state. It was again a result of the religious origin of Attic dramatic performances, and of the public importance attached to them, that the actor's profession was held in high esteem. These artists were as a matter of course free Athenian citizens, often the dramatists themselves, and at times were employed in other branches of the public service. In later days, when tragedy had migrated to Alexandria, and when theatrical entertainments had spread over all the Hellenic world, the art of acting seems to have reached an unprecedented height, and to have taken an extraordinary hold of the public mind. Synods or companies of Dionysian artists abounded, who were in possession of various privileges, and in one instance at least (at Pergamus) of rich endowments. The most important of these was the Ionic company, established first in Teos, and afterwards in Lebedos, near Colophon, which is said to have lasted longer than many a famous state. We likewise hear of strolling companies performing in *partibus*. Thus it came to pass that the vitality of some of the master-pieces of the Greek drama is without a parallel in theatrical history; while Greek actors were undoubtedly among the principal and most effective agents of the spread of literary culture through a great part of the known world.

The theory and technical system of the drama exercised Writers on the critical powers both of dramatists, such as Sophocles, the theory of the drama. and of the greatest among Greek philosophers. If Plato

touched the subject incidentally, Aristotle has in his *Poetics* (after 334) included an exposition of it, which, mutilated as it is, has formed the basis of all later systematic enquiries. The specialities of Greek tragic dramaturgy refer above all to the chorus; its general laws are those of the regular drama of all times. The theories of Aristotle and other earlier writers were elaborated by the Alexandrians, many of whom doubtless combined example with precept; they also devoted themselves to commentaries on the old masters, such as those in which Didymus (c. 30 B.C.) abundantly excelled, and collected a vast amount of learning on dramatic composition in general, which was doomed to perish, with so many other treasures, in the flames kindled by religious fanaticism.

Conclu-
sion.

"The history of the Greek stage," says Sir Walter Scott, "is that of the dramatic art in general;" and herein no doubt lies the broad distinction to be drawn between the drama of the Greeks and the isolated growths previously treated in this sketch. Yet though such is the case,—though in the Roman drama the native elements sink into insignificance when compared with those borrowed from the Greeks, and though the literary element in the modern drama of the West is directly or indirectly derived from the same source,—the Greek drama, both tragic and comic, had features of its own which it has been the principal aim of the foregoing brief account of it to mark. Tragedy never lost the traces of its religious origin; and the festive purposes of comedy are most signally apparent in precisely that period of its productivity whose works are least congenial to modern feeling and taste. But such is the wonderful power of the highest kind of art, that the tragedy of the three great masters, though its themes are so peculiar to itself that they have never been treated with the same effect by the numberless writers of other peoples who have essayed them, "hath ever been held the gravest, moralest, and most profitable of all other poems;" and such is the commanding claim of genius, that Aristophanes, who cultivated a species of comedy of an altogether eccentric kind, occupies an eminence in his branch of the drama hardly more contestable than that of the great tragic triad in theirs. What is Hecuba to us that we should weep for her,—or Antigone that our sympathy should accompany her on her holy errand, forbidden by human laws, but enjoined upon her by the behest of Zeus and of Justice dwelling with the gods below,—or Agamemnon that we should thrill with horror when his cries announce the wreaking of his doom? Why can we laugh at the ribald repartees of hide-seller and sausage-seller, careless of the merits of the former of these advanced politicians, and catch something of the dew of the rain-bringing maidens as it falls upon their beloved land, where the Bromian joy greets the advent of spring? Because in all these instances, and in every other, the art of the Greek drama, while winged by the individual power of genius, is at the same time true to its purposes as an art, and in harmony with Nature, who will not teach her laws or surrender her secrets of a sudden or to all.

ROMAN
DRAMA

In its most productive age, as well as in the times of its decline and decay, the ROMAN drama exhibits the continued coexistence of native forms by the side of those imported from Greece—either kind being necessarily often subject to the influence of the other. Italy has ever been the native land of acting and of scenic representation; and though Roman dramatic literature is in the main but a faint reflex of Greek examples, yet there is perhaps no branch of Roman literary art more congenial than this to the soil whence it sprang.

The beginnings of dramatic performances in Italy are to be sought in the rural festivities which doubtless from a

very early period developed in lively intermixture the elements of the dance, of jocular and abusive improvisations of song, speech, and dialogue, and of an assumption of character such as may be witnessed in any ordinary conversation among southern Italians at the present day. The occasions of these festivities were religious celebrations, public or private—among the latter more especially weddings, which have in all ages been provocative of mirthful demonstrations. The so-called *Fescennine* verses (from *fascinum*, or from Fescennium in southern Etruria), which were afterwards confined to weddings, and ultimately gave rise to an elaborate species of artistic poetry, never merged into actual dramatic performances. In the *satura*, on the other hand—a name originally due to the goatskins of the shepherds, but from primitive times connected with the *fullness* of both performers and performance—there seems from the first to have been a dramatic element; they were probably comic songs or stories recited with gesticulation and flute accompaniment. Introduced into the city, these entertainments received a new impulse from the performances of the Etruscan players (*Iudiones*), who had been brought into Rome when scenic games (*ludi scenici*) were, in 364 B.C., for purposes of religious propitiation, first held there. These *istriones*, as they were called at Rome (*istrini*), had been their native name), who have had the honour of transmitting their appellation to the entire *histrionic* art and its professors, were at first only dancers and pantomimists in a city where their speech was unintelligible. But their performances encouraged and developed those of other players and mountebanks, so that after the establishment of the regular drama at Rome on the Greek model, the *satura* came to be performed as farcical after-pieces (*exodia*), until they gave way to other species. Of these the *mimi* were at Rome probably coeval in their beginnings with the stage itself, where those who performed them were afterwards known under the same name, possibly in the place of an older appellation (*planipedes*, bare-footed). These loose farces, after being probably at first performed independently, were then played as after-pieces, till in the imperial period, when they reasserted their predominance, they were again produced by themselves. At the close of the republican period the *mimus* had found its way into literature (through D. Laberius and others), and had been assimilated in both form and subjects to other varieties of the comic drama—preserving, however, as its distinctive feature, a preponderance of the mimic or gesticulatory element. Together with the *pantomimus* (v. *infra*) the *mimus* continued to prevail in the days of the empire, having transferred its innate grossness (for it was originally a representation of low life) to its treatment of mythological subjects, with which it dealt in accordance with the demands of a "lubrique and adulterate age." As a matter of course, the *mimus* freely borrowed from other species, among which, so far as they were of native Italian origin, the *Atellane fables* (from Atella in Campania) call for special mention. Usually supposed to be of Oscan birth, they originally consisted in delineations of the life of small towns, in which dramatic and other satire has never ceased to find a favourite butt. The principal personages in these living sketches gradually assumed a fixed and conventional character, which they retained even when, after the final overthrow of Campanian independence (210), the *Atellane* had been transplanted to Rome. Here the heavy father or husband (*pyppus*), the ass-eared glutton (*maccus*), the full-cheeked, voracious chatterbox (*mucco*), and the wily sharper (*dorsenus*) became accepted comic types, and with others of a similar kind were handed down, to reappear in the modern Italian drama. In these characters lay the essence of the *Atellane*; their plots were extremely simple; the dialogue (perhaps interspersed with songs in

Origin of
its native
forms.

Satura

Atellane.

the Saturnian metre) it was left to the performers to improvise. In course of time these plays also assumed a literary form, being written out at length by their authors, but under the empire they were gradually absorbed in the pantomimes.

Origin of the regular Roman drama. The regular Roman drama, on the other hand, was of foreign (i.e., Greek) origin; and its early history, at all events, attaches itself to more or less fixed dates. It begins with the year 240 B.C., when at the *ludi Romani*, held with unusual splendour after the first Punic war, the victory was, according to Macedonian precedent, celebrated by the first production of a tragedy and a comedy on the Roman stage. The author of both, who appeared in person as an actor, was Livius Andronicus (b. 278 or earlier), a native of the Greek city of Tarentum, where the Dionysiac festivals enjoyed high popularity. His models were in tragedy the later Greek tragedians and their revisions of the three great Attic masters, in comedy no doubt Menander and his school. These continued the examples of the regular Roman drama during the whole of its course, even when it resorted to native themes.

History of Roman tragedy. The nature of Roman tragedy admits of no doubt, although our conclusions respecting its earlier progress are only derived from analogy, from scattered notices especially of the titles of plays, and from such fragments—mostly very brief—as have come down to us. Of the known titles of the tragedies of Livius Andronicus, six belong to the Trojan cycle, and this preference consistently maintained itself among the tragedians of the “Trojagenæ;” next in popularity seem to have been the myths of the house of Tantalus, of the Pelopidae, and of the Argonauts. The distinctions drawn by later Roman writers between the styles of the tragic poets of the republican period must in general be taken on trust. The Campanian Cn. Nævius (fl. from 236) wrote comedies as well as tragedies, so that the rigorous separation observed among the Greeks in the cultivation of the two dramatic species was at first neglected at Rome. His realistic tendency, displayed in that fondness for political allusions which brought upon him the vengeance of a noble family (the Metelli) incapable of understanding a joke of this description, might perhaps under more favourable circumstances have led him more fully to develop a new tragic species invented by him. But the *fabula prætecta* or *prætextata* (from the purple-bordered robe worn by higher magistrates) was not destined to become the means of emancipating the Roman serious drama from the control of Greek examples. In design, it was national tragedy on historic subjects of patriotic interest—which the Greeks had only treated in isolated instances; and one might at first sight marvel why, after Nævius and his successors had produced skilful examples of the species, it should have failed to overshadow and outlast in popularity a tragedy telling the oft-told foreign tales of Thebes and Mycenæ, or even the pseudo-ancestral story of Troy. But it should not be forgotten to how great an extent so-called early Roman history consisted of the traditions of the *gentes*, and how little the party-life of later republican Rome lent itself to a dramatic treatment likely to be acceptable both to the nobility and to the multitude. As for the emperors, the last licence they would have permitted to the theatre was a free popular treatment of the national history; if Augustus prohibited the publication of a tragedy by his adoptive father on the subject of *Œdipus*, it was improbable that he or his successors should have sanctioned the performance of plays dealing with the earthly fortunes of Divus Julius himself, or with the story of Marius, or that of the Gracchi, or any of the other tragic themes of later republican or imperial history. The historic drama at Rome thus had no opportunity for a vigorous life, even could tragedy have severed its main

course from the Greek literature of which it has been well called a “free-hand copy.” The *prætextæ* of which we know chiefly treat—possibly here and there helped to form¹—legends of a hoary antiquity, or celebrate battles chronicled in family or public records;² and in the end the species died a natural death.³

Q. Ennius (239–168), the favourite poet of the great Ennius and families, was qualified by his Tarentine education, which his successors taught the Oscan youth the Greek as well as the Latin tongue (so that he boasted “three souls”), to become the literary exponent of the Hellenizing tendencies of his age of Roman society. Nearly half of the extant names of his tragedies belong to the Trojan cycle; and Enripides was clearly his favourite source and model. M. Pacuvius (b. c. 229), like Ennius subject from his youth up to the influences of Greek civilization, and the first Roman dramatist who devoted himself exclusively to the tragic drama, was the least fertile of the chief Roman tragedians, but was regarded by the ancients as indisputably superior to Ennius. He again was generally (though not uniformly) held to have been surpassed by L. Accius (b. 170), a learned scholar and prolific dramatist, of whose plays 50 titles and a very large number of fragments have been preserved. The plays of the three last-named poets maintained themselves on the stage till the close of the republic; and Accius was quoted by the emperor Tiberius.⁴ Of the other tragic writers of the republic several were *dilettanti*—such as the great orator and eminent politician C. Julius Strabo; the cultivated officer Q. Tullius Cicero, who made an attempt, disapproved by his illustrious brother, to introduce the satyr-drama into the Roman theatre, L. Cornelius Balbus, a Cæsarean partisan; and finally C. Julius Cæsar himself. Tragedy continued to be cultivated under the earlier emperors; and of one author, the famous and ill-fated L. Annæus Seneca (4 B.C.–65 A.D.), a series of works has come down to us. In accordance with the character of their author’s prose-work, they exhibit a strong predominance of the rhetorical element, and a pomposity of style far removed from that of the poets Sophocles and Enripides, from whom Seneca derived his themes. The metrification of his plays is very strict, and they were doubtless intended for recitation, whether or not also designed for the stage. A few tragic poets are mentioned after Seneca, till about the reign of Domitian (81–96) the list comes to an end. The close of Roman tragic literature is obscurer than its beginning; and, while there are traces of tragic performances at Rome as late as even the 6th century, we are ignorant how long the works of the old masters of Roman tragedy maintained themselves on the stage.

It would obviously be an error to draw from the plays of Seneca—unfortunately the only examples of Roman tragedy we possess—conclusions as to the method and style of the earlier writers. In general, however, no important changes seem to have occurred in the progress of Roman tragic composition. The later Greek plays remained, so far as can be gathered, the models in treatment; and inasmuch as at Rome the single plays were performed by themselves, there was every inducement to make their action as full and complicated as possible. The dialogue-scenes (*deverbia*) appear to have been largely interspersed with musical passages (*cantica*); but the effect of the latter must have suffered from the barbarous custom of having the songs sung by

¹ Nævius, *Lupus* (The Wolf), *Romulus*, Ennius, *Sabinæ* (The Sabine Women), Accius, *Brutus*.

² Nævius, *Clasidium* (Marcellus?), Ennius, *Ambracia*, Pacuvius, *Paulus*, Accius, *Æneadæ* (Decius?).

³ Balbus’s *Ier* (The Mission), an isolated play on an episode of the Pharsalian campaign, seems to have been composed for the mere private delectation of its author and hero *Octavia*, a late *prætextata* ascribed to Seneca, was certainly not written by him.

⁴ “Oderint dum metuant” Atreus.

Characteristics of Roman tragedy.

a boy placed in front of the flute-player (*cantor*), while the actor accompanied them with gesticulations. The chorus (unlike the Greek) stood on the stage itself and seems occasionally at least to have taken part in the action. But the whole of the musical element can hardly have attained to so full a development as among the Greeks. The divisions of the action appear at first to have been three; from the addition of prologue and epilogue may have arisen the invention (probably due in tragedy to Varro) of the fixed number of five acts. In style, such influence as the genius of Roman literature could exercise must have been in the direction of the rhetorical and the pathetic; a surplus of energy on the one hand, and a defect of poetic richness on the other, can hardly have failed to characterize these, as they did all the other productions of earlier Roman poetry.

History of
Roman
comedy.

Palliata

In Roman comedy two different kinds—respectively called *palliata* and *togata* from the names of dress—were distinguished,—the former treating Greek subjects and imitating Greek originals, the latter professing a native character. The *palliata* sought its originals especially in New Attic comedy; and its authors, as they advanced in refinement of style, became more and more dependent upon their models, and unwilling to gratify the coarser tastes of the public by local allusions or gross seasonings. But that kind of comedy which shrinks from the rude breath of popular applause usually has in the end to give way to less squeamish rivals; and thus, after the species had been cultivated for about a century (c. 250–150 B.C.), *palliata* ceased to be composed except for the amusement of small circles, though the works of the most successful authors, Plautus and Terence, kept the stage even after the establishment of the empire. Among the earlier writers of *palliata* were the tragic poets Andronicus, Nævius, and Ennius, but they were alike surpassed by T. Maccius

Plautus

Plautus (254–184), nearly all of whose comedies esteemed genuine by Varro—not less than 20 in number—have been preserved. He was exclusively a comic poet, and though he borrowed his plots from the Greeks—from Diphilus and Philemon apparently in preference to the more refined Menander—there was in him a genuinely national as well as a genuinely popular element. Of the extent of his originality it is impossible to judge; probably it lies in his elaboration of character and the comic details of his dialogue rather than in his plots. Modern comedy is indebted to him in all these points; and in consequence of this fact, as well as of the attention his text has for linguistic reasons received from scholarship both ancient and modern, his merits have met with their full share of recognition. Statius Cæcilius (an Insubrian brought to Rome as a captive c. 200) stands midway between Plautus

Terence

and Terence, but no plays of his remain. P. Terentius Afer (c. 185–159) was, as his cognomen implies, a native of Carthage, of whose conqueror he enjoyed the patronage. His six extant comedies seem to be tolerably close renderings of their Greek originals, nearly all of which were plays of Menander. It was the good fortune of the works of Terence to be preserved in an exceptionally large number of MSS. in the monastic libraries of the Middle Ages, and thus (as will be seen) to become a main link between the ancient and the Christian drama. As a dramatist he is distinguished by correctness of style rather than by variety in his plots or vivacity in his characters, his chief merit—and at the same time the quality which has rendered him so suitable for modern imitation—is to be sought in the politico ease of his dialogue. In general, the characteristics of the *palliata*, which were divided into five acts, are those of the New Comedy of Athens, like which they had no chorus; for purposes of explanation from author to audience the prologue sufficed; the Roman versions were probably terser

than their originals, which they often altered by the process called *contamination*.

The *togata*, in the wider sense of the term, included all Roman plays of native origin—among the rest the *prætextæ*, in contradistinction to which and to the transient species of the *trabeatæ* (from the dress of the knights) the comedies dealing with the life of the lower classes were afterwards called *tabernariæ* (from *taberna*, a shop), a name suited by some of their extant titles,¹ while others point to the treatment of provincial scenes.² The *togata*, which was necessarily more realistic than the *palliata*, and doubtless fresher as well as coarser in tone, flourished in Roman literature between 170 and 80 B.C. In this species Titinius, all whose plays bear Latin titles and were *tabernariæ*, was succeeded by the more refined L. Afranius, who, though still choosing national subjects, seems to have treated them in the spirit of Menander. His plays continued to be performed under the empire, though with an admixture of elements derived from that lower species, the pantomime, to which they also were in the end to succumb. The Romans likewise adopted the burlesque kind of comedy called from its inventor *Rhinthonica*, and by other names (*cf. ante*)

The end of Roman dramatic literature was dilettantism and criticism, the end of the Roman drama was spectacle and show, buffoonery and sensual allurements. It was for this that the theatre had passed through all its early troubles, when the political puritanism of the old school had upheld the martial games of the circus against the enervating influence of the stage. In those days the guardians of Roman virtue had sought to diminish the attractions of the theatre by insisting upon its remaining as uncomfortable as possible; but as was usual at Rome, the privileges of the upper orders were at last extended to the population at large, though a separation of classes continued to be characteristic of a Roman audience. The first permanent theatre erected at Rome was that of Gn. Pompeius (55 B.C.), which contained nearly 18,000 seats, but even of this the portion allotted to the performers (*scæna*) was of wood, nor was it till the reign of Tiberius (22 A.D.) that, after being burnt down, the edifice was rebuilt in stone. See THEATRE.

Though a species of amateur literary censorship, introduced by Pompeius, became customary in the Augustan age, in general the drama's laws at Rome were given by the drama's patrons—in other words, the production of plays was a matter of private speculation. The exhibitions were contracted for with the officials charged with the superintendence of public amusements (*curatores ludorum*), the actors were slaves trained for the art, mostly natives of Southern Italy or Greece. Many of them rose to reputation and wealth, purchased their freedom, and themselves became directors of companies, but though Sulla might make a knight of Roscius, and Cæsar and his friends defy ancient prejudice, the stigma of civil disability (*infamia*) continued to adhere to the profession. The actor's art was carried on at Rome under conditions differing in other respects from those of the Greek theatre. The Romans loved a full stage, and from the later period of the republic liked to see it crowded with supernumeraries. This accorded with their military instincts, and with the general grossness of their tastes, which led them in the theatre as well as in the circus to delight in spectacle and tumult, and to applaud Pompeius when he furnished forth the return of Agamemnon in the *Clytemnestra* with a grand total of 600 heavily-laden mules. On the other hand, the actors were nearer to the spectators in the Roman theatre

¹ *Augur*, *Cinerarius* (*The Crimper*); *Fullonia* (*The Fuller's Trade*); *Liberius* (*The Freedman*), *Tibicina* (*The Flute-girl*)

² *Brundisiana*, *Ferentinatis*, *Sæcina*

than in the Greek, the stage (*pulpitum*) not being separated from the first rows of the audience by an orchestra occupied by the chorus; and this led in earlier times to the absence of masks, variously-coloured wigs serving to distinguish the age of the characters. Roscius, however, is said (in consequence of an obliquity of vision disfiguring his countenance) to have introduced the use of masks, and the innovation, though disapproved of, afterwards maintained itself. The tragic actors wore the *crepida*, corresponding to the *cothurnus*, and a heavy toga, which in the *prætexta* had the purple border giving its name to the species. The conventional costumes of the various kinds of comedy are likewise indicated by their names. The comparative nearness of the actors to the spectators encouraged the growth of that close criticism of acting for which Italy has always been famous, and which manifested itself in all the ways familiar to modern audiences. Where there is criticism, devices are apt to spring up for anticipating or directing it, and the evil institution of the *claque* is modelled on Roman precedent. In fine, though the art of acting at Rome must have originally formed itself on Greek example and precept, it was doubtless elaborated with a care unknown to the greatest Attic artists. Its most famous representatives were Gallus, called after his emancipation Q. Roscius Gallus (d. c. 62 B.C.), who, like the great "English Roscius," excelled equally in tragedy and comedy, and his younger contemporary Clodius Æsopus, a Greek by birth, likewise eminent in both branches of his art, though in tragedy more particularly. Both these great actors are said to have been constant hearers of the great orator Hortensius, and Roscius wrote a treatise on the relations between oratory and acting. In the influence of oratory upon the drama are perhaps to be sought the chief among the nobler features of Roman tragedy to which a native origin may be fairly ascribed.

The ignoble end of the Roman—and with it of the ancient classical—drama has been already foreshadowed. The elements of dance and song, never integrally united with the dialogue in Roman tragedy, were now altogether separated from it. While it became customary simply to recite tragedies to the small audiences who continued (or, as a matter of courtesy, affected) to appreciate them, the *pantomimus* commended itself to the heterogeneous multitudes of the Roman theatre by confining the performance of the actor to gesticulation and dancing, a chorus singing the accompanying text. The species was developed with extraordinary success already under Augustus by Pylades and Bathyllus; and so popular were these entertainments, that even eminent poets, such as Lucan (d. 65 A.D.), wrote the librettos for them, of which the subjects were generally mythological, only now and then historical, and chiefly of an amorous kind. A single masked performer was able to enchant admiring crowds by the art of gesticulation and movement only. In what direction this art tended, when suiting itself to the demands of a recklessly sensual age, may be gathered from the remark of one of the last pagan historians of the empire, that the introduction of pantomimes was a sign of the general moral decay of the world which began with the beginning of the monarchy. Comedy more easily lost itself in the cognate form of the *imus*, which survived all other kinds of comic entertainments because of its more audacious immorality and open obscenity. Women took part in these performances, by means of which, as late as the 6th century, a *mima* acquired a celebrity which ultimately raised her to the imperial throne. Meanwhile the regular drama had lingered on, enjoying in all its forms imperial patronage in the days of the literary revival under Hadrian (117–138), but the perennial taste for the spectacles of the amphitheatre, which reached its climax in

the days of Constantine the Great (306–337), hastened the downfall of the dramatic art in general. It was not absolutely extinguished even by the irruptions of the northern barbarians; but a bitter adversary had by this time risen into power. The whole authority of the Christian church had, without usually caring to distinguish between the nobler and the looser elements in the drama, involved all its manifestations in a consistent condemnation; and when the faith of that church was acknowledged as the religion of the Roman empire, the doom of the theatre was sealed. This doom was not undeserved, for the remnants of the literary drama had long been overshadowed by entertainments such as both earlier and later Roman emperors—Domitian and Trajan as well as Galerius and Constantine—had found themselves obliged to prohibit in the interests of public morality and order, by the bloody spectacles of the amphitheatre, and by the maddening excitement of the circus; the art of acting had become the pander of the low or frivolous itch of eye and ear; and the theatre had contributed its utmost to the demoralization of a world. The attitude taken up by the Christian church towards the stage was in general as unavoidable as its particular expressions were at times heated by fanaticism or distorted by ignorance. Had she not visited with her anathema a wilderness of decay, she could not herself have become—what she little dreamt of becoming—the nursing mother of the new birth of an art which seemed incapable of regeneration.

Though already in the 4th century actors and mount-banks had been excluded from the benefit of Christian sacraments, and excommunication had been extended to those who visited theatres instead of churches on Sundays and holidays, and though similar enactments had followed at later dates, yet the entertainments of the condemned profession had never been entirely suppressed, and had even occasionally received imperial patronage. Gradually, however, the *mimes* and their fellows became a wandering fraternity, who doubtless appeared at festivals when they were wanted and vanished again into the deepest obscurity which has ever covered that mysterious existence—a stroller's life. It was thus that these strange intermediaries of civilization carried down such traditions as survived of the acting drama of pagan antiquity into the succeeding ages.

While the scattered and persecuted strollers thus kept alive something of the popularity, if not of the loftier traditions, of their art, neither, on the other hand, was there an utter absence of written compositions to bridge the gap between ancient and modern dramatic literature. In the midst of the condemnation with which the Christian church visited the stage, its professors, and votaries, we find individual ecclesiastics resorting in their writings to both the tragic and the comic form of the ancient drama. These isolated productions, which include (in the latter part of the 4th century) the *Passion of Christ*, usually attributed to St Gregory Nazianzen, were doubtless mostly written for educational purposes, whether Euripides and Lycophron, or Menander, Plautus, and Terence served as the outward models. The same was probably the design of the famous "comedies" of Hrotsvitha, the Benedictine nun of Gandersheim, in Eastphalian Saxony, which associate themselves in the history of Christian literature with the spiritual revival of the 10th century in the days of Otto the Great. While avowedly imitated in form from the comedies of Terence, these religious exercises derive their themes—martyrdoms,¹ and miraculous or otherwise startling conversions²—

² *Gallicanus*, Part i., *Callimachus*; *Abraham*; *Paphnutius*.

from the legends of Christian saints. Thus from perhaps the 9th to the 12th centuries Germany and France, and through the latter, by means of the Norman Conquest, England, became acquainted with what may be called the literary monastic drama. It was no doubt occasionally performed by the children under the care of monks or nuns, or by the religious themselves; an exhibition of the former kind was that of the *Play of St Katharine*, acted at Dunstable about the year 1110 in "copes" by the scholars of the Norman Geoffrey, afterwards abbot of St Albans. Nothing is known of it except the fact of its performance, which was certainly not regarded as a novelty.

These efforts of the cloister came in time to blend themselves with more popular forms of the early Christian drama. To what extent the mimes, or *joculatores* (as in the early Middle Ages they came to be more generally called), kept alive the usage of entertainments more essentially dramatic than the minor varieties of their performances, we cannot say; but we know that in Northern France they at a very early date appropriated the beginnings of the religious drama to secular uses. Doubtless in both Celtic and Teutonic populations there survived the remnants of religious rites containing dramatic elements, and the heathen festivals, of Roman or other origin, communicated something of their character to the Christian, at which the *joculatores* were apt to appear. In different countries these entertainers suited themselves to different tastes, and with the rise of native literatures to different literary tendencies. The literature of the *troubadours* of Provence, which communicated itself to Spain and Italy, came only into isolated contact¹ with the beginnings of the religious drama; in Northern France the *jongleurs*, as the *joculatores* were now called, were confounded with the *trouvères*, who sang the *chansons de geste* commemorative of deeds of war. As appointed servants of particular households they were here, and afterwards in England, called *menestrels* (from *ministerium*) and *minstrels*. Such a *histrion* or *mimus* (as he is called) was Taillefer, who rode first into the fight at Hastings, singing his songs of Roland and Charlemagne, and tossing his sword in the air and catching it again. In England such accomplished minstrels easily outshone the less versatile gleemen of pre-Norman times; while here as elsewhere the humbler members of the craft strolled from castle to convent, to village-green and city-street, exhibiting as *jugglers* their pantomimic and other tricks.

Both the literary and the professional element had thus survived to become tributaries to the main stream of the early Christian drama, which had its source in the *liturgy* of the church itself. The service of the mass contains in itself dramatic elements, and combines with the reading out of portions of Scripture by the priest, its *epical* part, a *lyrical* one in the anthems and responses of the congregation. At a very early period—certainly already in the 5th century—it was usual to increase the attractions of public worship on special occasions by living pictures illustrating the Gospel narrative and accompanied by songs; and thus a certain amount of action gradually introduced itself into the service. When the epical part of the liturgy was connected with its spectacular and to some degree mimical adjuncts, the lyrical accompaniment being of course retained, the *liturgical mystery*—the earliest form of the Christian drama—was in existence. This had certainly been accomplished as early as the 10th century, when on great ecclesiastical festivals it was customary for the priests to perform in the churches the *offices* (as they were called) of the Shepherds, the Innocents, the Holy Sepulchre, &c.,

in connection with the gospel of the day. In France in the 12th, or perhaps already in the 11th century, short Latin texts were written for these liturgical mysteries; these included passages from the popular legend of St Nicholas as well as from scriptural story. In the same century the further step was taken of composing these texts in the vernacular—the earliest example being the mystery of the Resurrection. In time a whole series of mysteries was joined together; a process which was at first roughly and then more elaborately pursued in France and elsewhere, and finally resulted in the *collective mystery*—a mere scholars' term of course, but one to which the principal examples of the English mystery-drama correspond.

The productions of the mediæval religious drama it is usual technically to divide into three classes. The *mysteries* proper deal with scriptural events only, their purpose being to set forth, with the aid of the prophetic or preparatory history of the Old Testament, and more especially of the fulfilling events of the New, the central mystery of the Redemption of the world, as accomplished by the Nativity, the Passion, and the Resurrection. But in fact these were not kept distinctly apart from the *miracle-plays*, or *miracles*, which are strictly speaking concerned with the legends of the saints of the church; and in England the name *mysteries* was not in use. Of these species the miracles must more especially have been fed from the resources of the monastic literary drama. Thirdly, the *moralties*, or *moral-plays*, teach and illustrate the same truths; not, however, by direct representation of scriptural or legendary events and personages, but allegorically, their characters being personified virtues or qualities. Of the *moralties* the Norman *trouvères* had been the inventors; and doubtless this innovation connects itself with the endeavour, which in France had almost proved victorious by the end of the 13th century, to emancipate dramatic performances from the control of the church.

The attitude of the clergy towards the dramatic performances which had arisen out of the elaboration of the services of the church, but which soon admitted elements from other sources, was not, and could not be, uniform. As the plays grew longer, their paraphernalia more extensive, and their spectators more numerous, they began to be represented outside as well as inside the churches, and the use of the vulgar tongue came to be gradually preferred. Miracles were less dependent on this connection with the church services than mysteries proper, and lay associations, guilds, and schools in particular, soon began to act plays in honour of their patron saints in or near their own halls. Lastly, as scenes and characters of a more or less trivial description were admitted even into the plays acted or superintended by the clergy, as some of these characters came to be depended on by the audiences for conventional extravagance or fun, every new Herod seeking to out-Herod his predecessor, and the devils and their chief asserting themselves as indispensable favourites, the comic element in the religious drama increased; and that drama itself, even where it remained associated with the church, grew more and more profane. The endeavour to sanctify the popular tastes to religious uses, which connects itself with the institution of the great festival of Corpus Christi (1264, confirmed 1311), when the symbol of the mystery of the Incarnation was borne in solemn procession, led to the closer union of the dramatic exhibitions (hence often called *processus*) with this and other religious feasts; but it neither limited their range, nor controlled their development.

At times favoured, at times denounced by the clergy, dramatic entertainments thus lustily flourished for a series of centuries, in some countries more, in others less, religious in their character, and variously reinforced by the efforts

Mysteries proper deal with scriptural events only, their purpose being to set forth, with the aid of the prophetic or preparatory history of the Old Testament, and more especially of the fulfilling events of the New, the central mystery of the Redemption of the world, as accomplished by the Nativity, the Passion, and the Resurrection.

The attitude of the clergy towards the dramatic performances which had arisen out of the elaboration of the services of the church, but which soon admitted elements from other sources, was not, and could not be, uniform.

of the craftsmen of the acting profession. In France, where they had always preserved a secular side, they soonest advanced into forms connecting themselves with the later growths of the drama. At Paris the fraternity of the *Bazoche* (clerks of the Parliament and the Châtelet) in 1303 acquired the right of conducting the popular festivals; but after the *Confrérie de la Passion*, who devoted themselves originally to the performance of passion-plays, had obtained a royal privilege for this purpose in 1402, the *Bazoche* gave itself up to the production of moralities. A third association, calling itself the *Enfants sans souci* (the Devil-may-cares), having about the same time acquired the right of acting *sotties*—short comic plays with allegorical figures—the other companies took a leaf out of their book, interwove their mysteries and moralities with comic scenes from popular life, and gradually began to confine themselves to secular themes. Thus the transition to the regular drama here easily prepared itself, already in 1395 we find the brethren of the *Passion* performing a serious play on the story of *Griseldis*, and among the abundant literature of *sotties* and *farces* (from Italian *farsa*, Latin *farcta*), which after mingling real types with allegorical personages had come to exclude the latter, the immortal *Maistre Pierre Patelin* (acted in 1480 by the *Bazoche*) is, however slight in plot, in all essentials a comedy. No Italian mystery has been preserved from an earlier date than 1243, about which time associations were in this country also founded for the production of religious plays. These seem to have differed little from those of Northern Europe except by a less degree of coarseness in their comic characters. Plays on Old Testament subjects were called *figure*, on New *vangeli*, in the 15th and 16th centuries they were elaborated and produced with great care, and bore various names, of which *representazioni* was the most common.¹ The spectacular magnificence of theatrical displays accorded with that of the processions, both ecclesiastical and lay,—the *trionfi* as they were called in the days of Dante,—and the religious drama gradually acquired an academical character assimilating it to the classical attempts which gave rise to the regular Italian drama. The poetry of the Troubadours, which had come from Provence into Italy, here frequently took a dramatic form, and perhaps suggested his early experiments in this to Petrarch, the father of the Italian Renaissance. After his death there are traces of similar literary efforts in the *volgare Provençale* dialect. Meanwhile remnants of the ancient popular entertainments had survived in the improvised farces acted at the courts, in the churches (*farsa spirituale*), and among the people; the Roman carnival had preserved its waggon-plays (*carrè*); and numerous links remained to connect the popular modern comedy of the Italians with the *Atellanes* and *mimes* of their ancestors. In Spain, where all traces of the ancient Roman theatre (except its architectural remains) had disappeared after the Moorish conquest, the extant remains of the religious drama date from a still later period than the Italian—the 13th or 14th century. Its beginnings presented themselves in an advanced form, which aroused the opposition of the clergy, who sought to take the plays under their own control. In the secular literature of Spain nothing dramatic can be proved to have existed till the latter part of the 15th century. It had probably been customary from early times to insert in the mysteries so-called *entremeses* or interludes, but it is not till 1472 that in the couplets of *Mingo Revulgo* (i.e., Domingo Vulgus, the common people), and about the same time, in another dialogue by the same author, we have attempts of a kind

resembling the Italian *contrastì* (v. *infra*). In Germany, on the other hand (the history of whose drama so widely differs from that of the Spanish), religious plays were performed probably as early as the 12th century at the Christmas and Easter festivals. Other festivals were afterwards celebrated in the same way, but up to the Reformation Easter enjoyed the preference. About the 14th century miracle-plays began to be frequently performed; and as these often treated subjects of historical interest, local or other, the transition to the barren beginnings of the German historical drama was afterwards easy. Though these early German plays often have an element of the moralities, they were not as in France blended with the drolleries of the professional strollers (*fahrende Leute*), which, carried on chiefly in carnival time, gave rise to the Shrove-Tuesday plays (*Fastnachtspiele*), scenes from common life largely interspersed with practical fun. To these last a more enduring literary form was first given in the 15th century by Hans Rosenplut, called Schnepferer—or Hans Schnepferer, called Rosenblut—the predecessor of Haus Sachs. By this time a connection was establishing itself in Germany between the dramatic amusements of the people and the literary labours of the *master-singers*; but the religious drama proper survived in Catholic Germany far beyond the times of the Reformation, and was not suppressed in Bavaria and Tyrol till the end of the 18th century.¹

Omitting any notice of traces remaining of the religious drama in other European countries, we come to our own, from whose literature a fair idea may be derived of the general character of these mediæval productions. The *miracle-plays*, *miracles*, or *plays* (these being the terms used in England) of which we hear in London in the 12th century, were probably written in Latin and acted by ecclesiastics; but already in the following century mention is made—in the way of prohibition—of plays acted by professional players. (Isolated moralities of the 12th century are not to be regarded as popular productions.) In England as elsewhere, the clergy either sought to retain their control over the religious plays, which continued to be occasionally acted in churches even after the Reformation, or else reprobated them with or without qualifications. In Cornwall miracles in the native Cymric dialect were performed at an early date; but those which have been preserved are apparently copies of English (with the occasional use of French) originals, they were represented, unlike the English plays, in the open country, in extensive amphitheatres constructed for the purpose.

The flourishing period of English miracle-plays begins with the practice of their performance by trading-companies in the towns. Of this practice Chester is said to have set the example (1268–1276), it was followed in the course of the 13th and 14th centuries by many other towns, including Wakefield, Coventry, York, Newcastle-on-Tyne, Leeds, Lancaster, Preston, Kendal, Wymondham, Dublin, and London, in which last the performers were the parish clerks. Three collections, in addition to some single examples, of such plays have come down to us—viz, the *Towneley* plays, which were probably acted at the fairs of Woodkirk, near Wakefield, and those bearing the names of *Chester* and of *Coventry*. Their dates, in the forms in which they have come down to us, are more or less uncertain, that of the *Towneley* may be even earlier than the 14th century; the *Chester* may be ascribed to the close of the 14th or the earlier part of the 15th; the body of the *Coventry* probably belongs to the 15th or 16th. ¹ Such a piece was the *San Giovanni e San Paolo* (1488), by Lorenzo the Magnificent, the prince who afterwards sought to reform the Italian stage by paralyzing it.

¹ The passion-play of Oberammergau, familiar in its present artistic form to so many visitors, was instituted under special circumstances in the days of the Thirty Years' War (1634). Various reasons account for its having been allowed to survive.

the individual plays in these collections were doubtless founded on French originals; others are taken direct from Scripture, from the apocryphal gospels, or from the legends of the saints. Their characteristic feature is the combination of a whole series of plays into one *collective* whole, exhibiting the entire course of Bible history from the creation to the day of judgment. For this combination it is unnecessary to suppose that they were generally indebted to foreign examples, though there are several remarkable coincidences between the Chester plays and the French *Mystère du Vieil Testament*.

Manner
of their
performance

"The manner of these plays," we read in a description of those at Chester, dating from the close of the 16th century, "were:—Every company had his pageant, which pageants were a high scaffold with two rooms, a higher and a lower, upon four wheels. In the lower they apparelled themselves, and in the higher room they played, being all open at the top, that all beholders might hear and see them. The places where they played them was in every street. They began first at the abbey gates, and when the first pageant was played, it was wheeled to the high cross before the mayor, and so to every street, and so every street had a pageant playing before them at one time till all the pageants appointed for the day were played; and when one pageant was near ended, word was brought from street to street, that so they might come in place thereof, exceedingly orderly, and all the streets have their pageants afore them all at one time playing together; to see which plays was great resort, and also scaffolds and stages made in the streets in those places where they determined to play their pageants."

Each play, then, was performed by the representative of a particular trade or company, after whom it was called the fishers', glovers', &c., *pageant*; while a general prologue was spoken by a herald. As a rule the movable stage sufficed for the action, though we find horsemen riding up to the scaffold, and Herod instructed to "rage in the pagond and in the strete also." There is no probability that the stage was, as in France, divided into three platforms with a dark cavern at the side of the lowest, appropriated respectively to the Heavenly Father and His angels, to saints and glorified men, to mere men, and to souls in hell. But the last-named locality was frequently displayed in the English miracles, with or without fire in its mouth. The costumes were in part conventional,—divine and saintly personages being distinguished by gilt hair and beards, Herod being clad as a Saracen, the demons wearing hideous heads, the souls black and white coats according to their kind, and the angels gold skins and wings.

Character
of these
plays

Doubtless these performances abounded in what seem to us ludicrous features, and though their main purpose was serious, they were not in England at least intended to be devoid of fun. But many of these features are in truth only homely and naïf, and the simplicity of feeling they exhibit is at times not without its pathos. The occasional excessive grossness is due to an absence of refinement of taste rather than to an obliquity of moral sentiment. In this, as in other respects, the *Coventry Plays*, which were possibly written by clerical hands, show an advance upon the others. In the same plays is already to be observed an element of abstract figures, which connects them with a different species of the mediæval drama.

Moralities

The *moralities* corresponded to the love for moral allegory which manifests itself in so many periods of our literature, and which, while dominating the whole field of mediæval literature, was nowhere more assiduously and effectively cultivated than in England. It is necessary to bear this in mind, in order to understand what to us seems so strange, the popularity of the moral-plays, which indeed never equalled that of the miracles, but sufficed to maintain the former species till it received a fresh impulse from the connection established between it and the "new learning," together with the new political and religious ideas and questions, of the Reformation age. Moreover, a specially popular element was supplied to these plays, which

in manner of representation differed in no essential point from the miracles, in a character borrowed from the latter, and, in the moralities, usually provided with a companion whose task it was to lighten the weight of such abstractions as Sapience and Justice. These were the Devil and his attendant the *Vice*, of whom the latter seems to have been of native origin, and, as he was usually dressed in a fool's habit, was probably suggested by the familiar custom of keeping an attendant fool at court or in great houses. The *Vice* had many *aliases* (*Shift, Ambidexter, Sin, Fraud, Iniquity, &c.*), but his usual duty is to torment and tease the Devil his master for the edification and diversion of the audience. He was gradually blended with the domestic fool, who survived in the regular drama.

The earlier English moralities¹—from the reign of Henry VI. to that of Henry VII.—usually allegorize the conflict between good and evil in the mind and life of man, without any side-intention of theological controversy; such also is still essentially the purpose of the morality we possess by Henry VIII.'s poet, the witty Skelton,² and even of another, perhaps the most perfect example of its class, which in date is already later than the Reformation. But if such theology as *Every-Man* teaches is the orthodox doctrine of Rome, its successor, R. Weyer's *Lusty Juventus*, breathes the spirit of the dogmatic reformation of the reign of Edward VI. Theological controversy largely occupies the moralities of the earlier part of Elizabeth's reign, and connects itself with political feeling in a famous morality,³ Sir David Lyndsay's *Satire of the Three Estates*, written on the other side of the border, where such efforts as the religious drama proper had made had been extinguished by the Reformation. Only a single English political morality proper remains to us, which belongs to the beginning of the reign of Elizabeth.⁴ Yet another series connects itself with the ideas of the Renaissance rather than the Reformation, treating of intellectual progress rather than of moral conduct;⁵ this extends from the reign of Henry VIII. to that of his younger daughter.

The transition from the morality to the regular drama in England was effected on the one hand by the intermixture of historical personages with abstractions—as in Bishop Bale's *Kyng Johan* (c. 1548)—which easily led over to the *Chronicle History*; on the other by the introduction of types of real life by the side of abstract figures. This latter tendency, of which instances occur in earlier plays, is observable in several of the 16th century moralities;⁶ but before most of these were written, a further step in advance had been taken by a man of genius, John Heywood (d. 1565), whose *interludes*⁷ were short farces in the French manner, dealing entirely with real—very real—men and women. Orthodox and conservative, he had at the same time a keen eye for the vices as well as the follies of his age, and not the least for those of the clerical profession. Other writers, such as T. Ingeland,⁸ took the same direction; and the allegory of abstractions was thus undermined on the stage, very much as in didactic literature the ground had been cut from under its feet by the *Ship of Fools*. Thus the *interludes*—a name which had been used for the moralities themselves from an early date—facilitated the advent of comedy, without having superseded the earlier form. Both moralities and miracle-plays survived into the Elizabethan age, after the regular drama had already begun its course.

of the craftsmen of the acting profession. In France, where they had always preserved a secular side, they soonest advanced into forms connecting themselves with later growths of the drama. At Paris the fraternity of the *Bazoche* (clerks of the Parliament and the Châtelet) in 1303 acquired the right of conducting the popular festivals; but after the *Confrère de la Passion*, who devoted themselves originally to the performance of passion-plays, had obtained a royal privilege for this purpose in 1402, the *Bazoche* gave itself up to the production of moralities. A third association, calling itself the *Enfants sans souci* (the Devil-may-cares), having about the same time acquired the right of acting *sotties*—short comic plays with allegorical figures—the other companies took a leaf out of their book, interwove their mysteries and moralities with comic scenes from popular life, and gradually began to confine themselves to secular themes. Thus the transition to the regular drama here easily prepared itself; already in 1395 we find the brethren of the *Passion* performing a serious play on the story of *Griseldis*, and among the abundant literature of *sotties* and *farces* (from Italian *farsa*, Latin *fareita*), which after mingling real types with allegorical personages had come to exclude the latter, the immortal *Maitre Pierre Patelin* (acted in 1480 by the *Bazoche*) is, however slight in plot, in all essentials a comedy. No Italian mystery has been preserved from an earlier date than 1243, about which time associations were in this country also founded for the production of religious plays. These seem to have differed little from those of Northern Europe except by a less degree of coarseness in their comic characters. Plays on Old Testament subjects were called *figure*, on New *vangelii*; in the 15th and 16th centuries they were elaborated and produced with great care, and bore various names, of which *rappresentazioni* was the most common.¹ The spectacular magnificence of theatrical displays accorded with that of the processions, both ecclesiastical and lay,—the *trionfi* as they were called in the days of Dante,—and the religious drama gradually acquired an academical character assimilating it to the classical attempts which gave rise to the regular Italian drama. The poetry of the Tronbadours, which had come from Provence into Italy, here frequently took a dramatic form, and perhaps suggested his early experiments in this to Petrarch, the father of the Italian Renaissance. After his death there are traces of similar literary efforts in the *volgare Provençale* dialect. Meanwhile remnants of the ancient popular entertainments had survived in the improvised farces acted at the courts, in the churches (*farsa spirituale*), and among the people, the Roman carnival had preserved its waggon-plays (*carri*); and numerous links remained to connect the popular modern comedy of the Italians with the *Atellanes* and *mimes* of their ancestors. In Spain, where all traces of the ancient Roman theatre (except its architectural remains) had disappeared after the Moorish conquest, the extant remains of the religious drama date from a still later period than the Italian—the 13th or 14th century. Its beginnings presented themselves in an advanced form, which aroused the opposition of the clergy, who sought to take the plays under their own control. In the secular literature of Spain nothing dramatic can be proved to have existed till the latter part of the 15th century. It had probably been customary from early times to insert in the mysteries so-called *entremeses* or interludes; but it is not till 1472 that in the comets of *Mingo Revulgo* (i.e., Domingo Vulgus, the common people), and about the same time, in another dialogue by the same author, we have attempts of a kind

resembling the Italian *contrast*i (v. *infra*). In Germany, on the other hand (the history of whose drama so widely differs from that of the Spanish), religious plays were performed probably as early as the 12th century at the Christmas and Easter festivals. Other festivals were afterwards celebrated in the same way, but up to the Reformation Easter enjoyed the preference. About the 14th century miracle-plays began to be frequently performed; and as these often treated subjects of historical interest, local or other, the transition to the barren beginnings of the German historical drama was afterwards easy. Though these early German plays often have an element of the moralities, they were not as in France blended with the drolleries of the professional strollers (*fahrende Leute*), which, carried on chiefly in carnival time, gave rise to the Shrove-Tuesday plays (*Fastnachtspiele*), scenes from common life largely interspersed with practical fun. To these last a more enduring literary form was first given in the 15th century by Hans Rosenplut, called Schnepferer—or Hans Schnepferer, called Rosenblut—the predecessor of Hans Sachs. By this time a connection was establishing itself in Germany between the dramatic amusements of the people and the literary labours of the *master-singers*; but the religious drama proper survived in Catholic Germany far beyond the times of the Reformation, and was not suppressed in Bavaria and Tyrol till the end of the 18th century.¹

Omitting any notice of traces remaining of the religious drama in other European countries, we come to our own, from whose literature a fair idea may be derived of the general character of these mediæval productions. The *miracle-plays*, *miracles*, or *plays* (these being the terms used in England) of which we hear in London in the 12th century, were probably written in Latin and acted by ecclesiastics; but already in the following century mention is made—in the way of prohibition—of plays acted by professional players (Isolated moralities of the 12th century are not to be regarded as popular productions.) In England as elsewhere, the clergy either sought to retain their control over the religious plays, which continued to be occasionally acted in churches even after the Reformation, or else reprobated them with or without qualifications. In Cornwall miracles in the native Cymric dialect were performed at an early date; but those which have been preserved are apparently copies of English (with the occasional use of French) originals; they were represented, unlike the English plays, in the open country, in extensive amphitheatres constructed for the purpose.

The flourishing period of English miracle-plays begins with the practice of their performance by trading-companies in the towns. Of this practice Chester is said to have set the example (1268–1276), it was followed in the course of the 13th and 14th centuries by many other towns, including Wakefield, Coventry, York, Newcastle-on-Tyne, Leeds, Lancaster, Preston, Kendal, Wymondham, Dublin, and London, in which last the performers were the parish clerks. Three collections, in addition to some single examples, of such plays have come down to us—viz., the *Towneley* plays, which were probably acted at the fairs of Woodkirk, near Wakefield, and those bearing the names of *Chester* and of *Coventry*. Their dates, in the forms in which they have come down to us, are more or less uncertain, that of the *Towneley* may be even earlier than the 14th century; the *Chester* may be ascribed to the close of the 14th or the earlier part of the 15th; the body of the *Coventry* probably belongs to the 15th or 16th. Many of

¹ Such a piece was the *San Giovanni e San Paolo* (1488), by Lorenzo the Magnificent, the prince who afterwards sought to reform the Italian stage by paralyzing it.

¹ The passion play of Oberammergau, familiar in its present artistic form to so many visitors, was instituted under special circumstances in the days of the 'Thirty Years' War (1634). Various reasons account for its having been allowed to survive.

the individual plays in these collections were doubtless founded on French originals; others are taken direct from Scripture, from the apocryphal gospels, or from the legends of the saints. Their characteristic feature is the combination of a whole series of plays into one *collective* whole, exhibiting the entire course of Bible history from the creation to the day of judgment. For this combination it is unnecessary to suppose that they were generally indebted to foreign examples, though there are several remarkable coincidences between the Chester plays and the French *Mystère du Viel Testament*.

Manner
of their
perform-
ance

"The manner of these plays," we read in a description of those at Chester, dating from the close of the 16th century, "were — Every company had his pageant, which pageants were a high scaffold with two rooms, a higher and a lower, upon four wheels. In the lower they apparelled themselves, and in the higher room they played, being all open at the top, that all beholders might hear and see them. The places where they played them was in every street. They began first at the abbey gates, and when the first pageant was played, it was wheeled to the high cross before the mayor, and so to every street, and so every street had a pageant playing before them at one time till all the pageants appointed for the day were played; and when one pageant was near ended, word was brought from street to street, that so they might come in place thereof, exceedingly orderly, and all the streets have their pageants afore them all at one time playing together, to see which plays was great resort, and also scaffolds and stages made in the streets in those places where they determined to play their pageants."

Each play, then, was performed by the representative of a particular trade or company, after whom it was called the fishers', glovers', &c., *pageant*; while a general prologue was spoken by a herald. As a rule the movable stage sufficed for the action, though we find horsemen riding up to the scaffold, and Herod instructed to "rage in the pagond and in the strete also." There is no probability that the stage was, as in France, divided into three platforms with a dark cavern at the side of the lowest, appropriated respectively to the Heavenly Father and His angels, to saints and glorified men, to mere men, and to souls in hell. But the last-named locality was frequently displayed in the English miracles, with or without fire in its mouth. The costumes were in part conventional,—divine and saintly personages being distinguished by gilt hair and beards, Herod being clad as a Saracen, the demons wearing hideous heads, the souls black and white coats according to their kind, and the angels gold skins and wings.

Such, in barest outline, was the progress of dramatic entertainments in the principal countries of Europe, before the revival of classical studies brought about a return to the examples of the classical drama, or before this return had distinctly asserted itself. It must not, however, be forgotten that from an early period in England as elsewhere had flourished a species of entertainments, not properly speaking dramatic, but largely contributing to form and foster a taste for dramatic spectacles. The *pageants*—as they were called in England—were the successors of those *ridings* from which, when they gladdened “Chepe,” Chaucer’s idle apprentice would not keep away; but they had advanced in splendour and ingenuity of device under the influence of Flemish and other foreign examples. Costumed figures represented before gaping citizens the heroes of mythology and history, and the abstractions of moral, patriotic, or municipal allegory, and the city of London clung with special fervour to these exhibitions, which the Elizabethan drama was neither able nor—as represented by most of its poets who composed devices and short texts for these and similar shows—willing to oust from popular favour. Some of the greatest and some of the least of our dramatists were the ministers of pageantry; and perhaps it would have been an advantage for the future of the theatre, if the legitimate drama and the *Triumphs of Old Drapery* had been more jealously kept apart.

The literary influence which finally transformed the growths noticed above into the national dramas of the several countries of Europe, was in a word the influence of the Renaissance. Among the remains of classical antiquity which were studied, translated, and imitated, those of the drama necessarily held a prominent place. Never altogether lost sight of, they now became subjects of devoted research and models for careful copies, first in one of their own, then in modern, tongues, and these essentially literary endeavours came into more or less direct contact with, and acquired more or less control over, the already existing entertainments of the stage. Thus the stream of the modern drama, whose source and contributories have been described, was brought back into the ancient bed, from which its flow diverged into a number of national courses, unequal in impetus and strength, and varying in accordance with the manifold conditions of their progress. Of these it remains to pursue the most productive or important.

The priority in this as in most of the other aspects of the Renaissance belongs to ITALY. In ultimate achievement, the Italian drama fell short of the fulness of the results obtained elsewhere—a surprising fact when it is considered, not only that the Italian language had the vantage-ground of closest relationship to the Latin, but that the genius of the Italian people has at all times inspired it with a predilection for the drama. The cause is doubtless to be sought in the absence from Italian national life during a long period, and more especially during that contemporary with the rise and earlier promise of Italian dramatic literature, of those loftiest and most potent impulses of popular feeling to which a national drama owes so much of its strength. This absence was due partly to the peculiarities of the Italian character, partly to the political and ecclesiastical experiences Italy was fated to undergo. The Italians were strangers to the enthusiasm of patriotism, which was as the breath in the nostrils of our Elizabethan age, as well as to the single-minded religiosity which identified Spain with the spirit of the Catholic Revival. The clear-sightedness of the Italians had something to do with this—for they were too intelligent to believe in their tyrants, and too free from

illusions to deliver up their minds to their priests. The chilling and enervating effects of a pressure of foreign domination, such as no Western people with a history and a civilization like those of Italy has ever experienced, did the rest, and for many generations rendered impotent the higher efforts of the dramatic art. No basis was permanently found for a really national tragedy, while literary comedy, after turning from the direct imitation of Latin models to a more popular form, lost itself in an abandoned immorality of tone and in reckless insolence of invective against particular classes of society. Though its productivity long continued, the poetic drama more and more concentrated its efforts upon subordinate or subsidiary species, artificial in origin and decorative in purpose, and surrendered its substance to the overpowering aids of music, dancing, and spectacle. Only a single form of the Italian drama, the improvised comedy, remained truly national; and this was of its nature dissociated from higher literary effort. The revival of Italian tragedy in later times is due partly to the imitation of French models, partly to the endeavour of a brilliant genius to infuse into his art the historical and political spirit. Comedy likewise attained to new growths of considerable significance, when it was sought to accommodate its popular forms to the representation of real life in a wider range, and again to render it more poetical in accordance with the tendencies of modern romanticism.

The regular Italian drama, in both its tragic and its comic branches, began with a reproduction, in the Latin language, of classical models; but tragedy in its beginnings showed a tendency which it was before long to treat themes of national historical interest. Two earliest tragedies of which we hear, written by the Paduan historian Mussato about 1300, were both copies of Seneca, but while the one (*Achilles*) treated a classical theme, the other dealt with the history of a famous tyrant of the author’s native city (*Eccerimis*). In the next century events of recent or contemporary history were similarly dealt with,¹ but the majority of its Latin dramas were doubtless written to suit the tastes of the friends and patrons of the Italian Renaissance, who, like Lorenzo the Magnificent, wished to domesticate the heathen gods and goddesses on a stage hitherto occupied by the sacred figures of Christian belief. Such were the Latin imitations and translations of Greek and Latin tragedies and comedies by Bishop Martirano, the friend of Lorenzo’s son Pope Leo X., on the adventure of Danaë² and other subjects; the famous *Progne* of G. Corraro (d. 1464), the nephew of an earlier Pope; and the efforts of Pomponius Lætus, who, with the aid of Cardinal Riario, sought to revive the ancient theatre, especially that of Plautus and Terence, at Rome. Many Latin comedies are mentioned from the 15th century, during which, as during its predecessor, Latin continued the dominant language of the stage in Italy. Nor was the representation even of Greek plays altogether unknown; it was by her performance of the *Electra* of Sophocles that Alexandra Scala caused Politian to envy Orestes.

Early in the 16th century, tragedy began to be written in the native tongue; but it retained from the first, and never wholly lost, the impress of its origin. Whatever the source of its subjects—which, though mostly of classical origin, were occasionally derived from native romance, or even due to invention—they were all treated with a predilection for the horrible, inspired by the example of Seneca, though no doubt encouraged by a perennial national taste. The chorus, stationary on the stage as in old Roman

tragedy, was not reduced to a merely occasional appearance between the acts till the beginning of the 17th century, or ousted altogether from the tragic drama till the earlier half of the 18th. Thus the changes undergone by Italian tragedy were for a long series of generations chiefly confined to the form of versification and the choice of themes; nor was it, at all events till the last century of the course it has hitherto run, more than the after-growth of an after-growth. The honour of having been the earliest tragedy in Italian seems to belong to Galeotto's *Sofonisba* (1502), a piece in 15 or 20 acts, regardless of unity of scene. A da Pistoia's *Pamila* (1508) followed, of which the subject was taken from Boccaccio, though the names of the characters were Greek. The play usually associated with the beginning of Italian tragedy—that with which “th’ Italian scene first learned to glow”—was another *Sofonisba*, acted before Leo X. in 1515, and written in blank verse (*verso scioltto*) instead of the *ottava* and *terza rima* of the earlier tragedians (retaining, however, the lyric measures of the chorus), by Trissino, who was employed as nuncio by that Pope. Other tragedies of the former half of the 16th century were the *Rosmunda* of Rucellai, a nephew of Lorenzo the Magnificent (1516); Alamanni's *Antigone* (1532); the *Canace* of Sperono Speroni, the envious Mopsus of Tasso, who, like Guarini, took Sperone's elaborate style for his model; the *Oracia*, the earliest dramatic treatment of this famous subject, of the notorious Aretino (1549); and the nine tragedies of G. Cinthio, among which *L'Orbecche* (1541) is accounted the best and the bloodiest. Cinthio, the author of those *Hecatomithi* to which Shakespeare was indebted for so many of his subjects, was (supposing him to have invented these) the first Italian who was the author of the fables of his own dramas; he introduced some novelties into dramatic construction, separating the prologue and probably also the epilogue from the action, and has by some been regarded as the inventor of the pastoral drama. In the latter half of the 16th century may be mentioned the *Didone* and the *Marianna* of L. Dolce, the translator of Seneca (1565); the *Hadriana* (acted before 1561 or 1586) of L. Groto, which treats the story of *Romeo and Juliet*: Tasso's *Torrismondo* (1587); the *Tancrèdi* of Asinari (1588); and the *Merope* of Torelli (1593), the last who employed the stationary chorus (*coro fisso*) on the Italian stage. Leonico's *Soldato* (1550) is noticeable as supposed to have given rise to the *tragedia cittadina*, or domestic tragedy, of which there are few examples in the Italian drama, and De Velo's *Tamar* (1586), as written in prose. Subjects of modern historical interest were in this period treated only in isolated instances.¹

Italian
tragedy in
the 17th
and 18th
centuries.

The tragedians of the 17th century continued to pursue the beaten track, at times in vain, seeking by the introduction of musical airs to compromise with the danger with which their art was threatened of being (in Voltaire's phrase) extinguished by the beautiful monster, the opera, now rapidly gaining ground in the country of its origin. (See OPERA.) To Count P. Bonarelli (1589–1659), the author of *Soimano*, is on the other hand ascribed the first disuse of the chorus in Italian tragedy. The innovation of the use of rhyme attempted in the learned Pallavicino's *Erminigildo* (1655), and defended by him in a discourse prefixed to the play, was in Italy no more than in England able to achieve a permanent success; its chief representative was afterwards Martelli (d. 1727), whose rhymed Alexandrian verse (*Martelliano*), though on one occasion used in comedy by Goldoni, failed to commend itself to the popular taste. By the end of the 17th century Italian tragedy seemed destined to expire, and the great tragic actor Cotta had withdrawn in disgust at the apathy of the

public towards the higher forms of the drama. The 18th century was, however, to witness a change, the beginning, of which are attributed to the institution of the Academy of the Arcadians at Rome (1690). The principal efforts of the new school of writers and critics were directed to the abolition of the chorus, and to a general increase of freedom in treatment. Before long the Marquis S. Maffei Maffei with his *Merope* (first printed 1713) achieved one of the most brilliant successes recorded in the history of dramatic literature. This play, which is devoid of any love-story, long continued to be considered the master-piece of Italian tragedy; Voltaire, who declared it “worthy of the most glorious days of Athens,” adapted it for the French stage, and it inspired a celebrated production of the English drama.² It was followed by a tragedy full of horrors,³ noticeable as having given rise to the first Italian dramatic parody; and by the highly esteemed productions of Granelli (d. 1769) and his contemporary Bettinelli. The influence of Voltaire had now come to predominate over the Italian drama; and, in accordance with the spirit of the times, greater freedom prevailed in the choice of tragic themes. Thus the greatest of Italian tragic poets, Count V. Alfieri (1749–1803), found his path prepared Alfieri. for him. Alfieri's grand and impassioned treatment of his subjects caused his faultiness of form, which he never altogether overcame, to be forgotten. The spirit of a love of freedom which his creations⁴ breathe was the herald of the national ideas of the future. Spurning the usages of French tragedy, his plays, which abound in soliloquies, owe part of their effect to an impassioned force of declamation, part to those “points” by which Italian acting seems pre-eminently capable of thrilling an audience. He has much—besides the subjects of two of his dramas⁵—in common with Schiller, but his amazon-muse (as Schlegel called her) was not schooled into serenity, like the muse of the German poet. Among his numerous plays (21), *Merope* and *Saul*, and perhaps *Mirra*, are accounted his master-pieces.

The political colouring given by Alfieri to Italian tragedy reappears in the plays of U. Foscolo (c. 1760–1827) and A. Manzoni (1784–1873), both of whom are under the influence of the romantic school of modern literature; and to these names must be added those of S. Pellico (1789–1854) and G. B. Niccolini (1785–1861), whose most celebrated dramas⁶ treat national themes familiar to all students of modern history and literature. While Italian tragedy has upon the whole adhered to its love of strong situations and passionate declamation, its later growths have shown a capability of development precluding the supposition that its history is closed. The art of tragic acting at the present day probably stands higher in Italy than in any other European country; if the tragic muse were to be depicted with the features of a living artist, it is those of Adelaide Ristori which she would assume.

In comedy, the efforts of the scholars of the Italian Renaissance for a time went side by side with the progress of the popular entertainments noticed above. While the contrast of the close of the 15th and of the 16th century were disputations between pairs of abstract or allegorical figures, in the *rottola* human types take the place of abstractions, and more than two characters appear. To the *farsa* (a name used of a wide variety of entertainments) a new literary as well as social significance was given by the Neapolitan court-poet Sannazaro (c. 1492), about the same time a “*capitano valoroso*,” Venturino of Pesara, first brought on the modern stage the *capitano glorioso* or *spauente*, the

military braggart who owed his origin both to Plautus¹ and to the Spanish officers who abounded in the Italy of those days. The popular character-comedy, a relic of the ancient *Atellanes*, likewise took a new lease of life—and this in a double form. The *improvised* comedy (*commedia a soggetto*) was now as a rule performed by professional actors, members of a *craft*, and was thence called the *commedia dell'arte*, which is said to have been invented by Francesco (called Terenziano) Chorea, the favourite player of Leo X. Its scenes, still unwritten except in skeleton (*scenario*), were connected together by the ligatures or links (*lazzi*) of the *arlechino*, the descendant of the ancient Roman *sannio* (whence our *zany*). Harlequin's summit of glory was probably reached early in the 17th century, when he was ennobled in the person of Cecchino by the Emperor Matthias; of Cecchino's successors Zaccagnino and Truffaldino, we read that "they shut the door in Italy to good harlequins." Distinct from this growth is that of the *masked* comedy, the action of which was chiefly carried on by certain typical figures in masks, speaking in local dialects,² but which was not improvised, and indeed from the nature of the case hardly could have been. Its inventor was A. Beolco of Padua, who called himself Ruzzante (joker), and who published six comedies in various dialects, including the Greek of the day (1530). This was the masked comedy to which the Italians so tenaciously clung, and in which, as all their own and imitable by no other nation, they took so great a pride that even Goldoni was unable to overthrow it.

Meanwhile the Latin imitations of Roman, varied by occasional translations of Greek, comedies early led to the production of Italian translations, several of which were performed at Ferrara in the 15th century, and before its close to the composition of what is regarded as the first original Italian comedy—in other words, as the first of the modern drama. But the claim to this honour of Boiardo's *Timone* (before 1494) is doubtful—not in time,³ but because this play is only in part original, being founded upon, and in a great measure taken from, a dialogue of Lucian's; since moreover its personages are abstractions, it represents at most the transition from the moralities. The "first Italian comedy in verse," Ricci's *I Tre Tiranni* (before 1530), is likewise a morality, and Trissino's comedy, which followed, a mere adaptation of the *Menæchmi* of Plautus. About this time, however, the *commedia erudita*, or scholarly comedy, began to be cultivated by a succession of eminent writers, among whom the title of the father of modern comedy, if it belongs to any man, belongs to Ariosto (1474–1533). His comedies (though the first two were originally written in prose) are in blank verse, to which he gave a singular mobility by the dactylic ending of the line (*sdrucchiolo*). Ariosto's models were the masterpieces of the *pallata*, and his morals those of his age, which equalled those of the worst days of ancient Rome or

Byzantium in looseness, and surpassed them in effrontery. He chose his subjects accordingly, but his dramatic genius displayed itself in the effective drawing of character,⁴ and more especially in the skillful management of complicated intrigues.⁵ Such, with an additional brilliancy of wit and lasciviousness of tone, are likewise the characteristics of Machiavelli's (1469–1527) famous prose comedy, the *Mandragola* (*The Magic Draught*);⁶ and, in their climacteric, of the plays of P. Aretino (1492–1557), especially the prose *Marescalco*, whose name, it has been said, ought to be written in asterisks. Other comedians of the 16th century were B. Accolti, whose *Virginia* (prob. before 1513) treats the story from Boccaccio which reappears in *All's Well that Ends Well*; G. B. Araldo and J. Nardi, noteworthy as decent and moral in tone and tendency; G. Cecchi, F. d'Ambra, A. J. Grazzini, N. Secco or Secchi, and L. Dolce—all writers of romantic comedy or intrigue in verse or prose.

During the same century the *pastoral drama* flourished in Italy. The origin of this peculiar species—which was the bucolic idyll in a dramatic form, and which freely lent itself to the introduction of both mythological and allegorical elements—was purely literary, and arose directly out of the classical studies and tastes of the Renaissance. Its first example was the renowned scholar A. Poliziano's *Orfeo* (1472), which begins like an idyll and ends like a tragedy. Intended to be performed with music—for the pastoral drama is the parent of the opera—this beautiful work tells its story simply. N. da Correggio's (1450–1508) *Cefalo*, or *Aurora*, and others followed, before in 1551 A. Beccari produced, as totally new of its kind, his Arcadian pastoral drama *Il Sogrisizio*, in which the comic element predominates. But an epoch in the history of the species is marked by the *Aminta* of Tasso (1573), in whose Arcadia is allegorically mirrored the Ferrara court. Adorned by choral lyrics of great beauty, it presents an allegorical treatment of a social and moral problem, and since the conception of the characters, all of whom think and speak of nothing but love, is artificial, the charm of the poem lies not in the interest of its action, but in the passion and sweetness of its sentiment. This work was the model of many others, and the pastoral drama reached its height of popularity in the famous *Pastor Fido* (written before 1590) of B. Guarini, which, while founded on a tragic love-story, introduces into its complicated plot a comic element, partly with a satirical intention. Thus, both in Italian and in other literatures, the pastoral drama became a distinct species, characterized like the great body of modern pastoral poetry in general by a tendency either towards the artificial or towards the burlesque. Its artificiality affected the entire growth of Italian comedy, including the *commedia dell'arte*, and impressed itself in an intensified form upon the opera. (See OPERA.) The foremost Italian masters of the last-named species, so far as it can claim to be included in the poetic drama, were A. Zeno (1668–1750) and P. Metastasio (1698–1782).

The comic dramatists of the 17th century are grouped as followers of the classical and of the romantic school, G. B. Porta and G. A. Cicognini (whom Goldoni describes as full of whining pathos and common place drollery, but as still possessing a great power to interest) being regarded as the leading representatives of the former. But neither of these largely intermixed groups of writers could, with all its fertility, prevail against the competition on the one hand of the musical drama, and on the other of the popular farcical entertainments and of those introduced in imita-

¹ Pyrgopolinices in the *Miles Gloriosus*.

² The masked characters, each of which spoke the dialect of the place he represented, were (according to Baretto) *Pantalone*, a Venetian merchant, *Doctore*, a Bolognese physician, *Spavento*, a Neapolitan braggadocio; *Pulicarella*, a wag of Apulia, *Giangurgolo* and *Corvello*, clowns of Calabria, *Gelfomino*, a Roman beau; *Brighella*, a Ferrarese pimp, and *Arlecchino*, a blundering servant of Bergamo. Besides these and a few other such personages (of whom four at least appeared in each play), there were the *Amorosos* or *Innamoratos*, men or women (the latter not before 1660, up to which time actresses were unknown in Italy) with serious parts, and *Smeraldina*, *Colombina*, *Spilletta*, and other *servettas* or waiting-maids. All these spoke Tuscan or Roman, and wore no masks.

³ Boiardo died in 1494, in or after which year Nardi's *Amicizia* was written, while Dovizio's (afterwards Cardinal of Bibbiena) disreputable but entertaining *Calandria*, a prose comedy, which protests that it is not taken from Plautus, is thought to have been composed not long before its representation in 1508.

⁴ *La Lena*; *Il Negromante*.

⁵ *La Cassaria*; *I Suppositi*.

⁶ Of Machiavelli's other comedies one is in verse, the other two, free adaptations from Plautus and Terence, are in prose.

tion of Spanish examples. Italian comedy had fallen into decay, when its reform was undertaken by the wonderful theatrical genius of C. Goldoni (1707-1793). One of the most fertile and rapid of playwrights (of his 150 comedies 16 were written and acted in a single year), he at the same time pursued definite aims as a dramatist. Disgusted with the conventional buffoonery, and ashamed of the rampant immorality, of the Italian comic stage, he drew his characters from real life, whether of his native city (Venice)¹ or of society at large, and sought to enforce virtuous and pathetic sentiments without neglecting the essential objects of his art. Happy and various in his choice of themes, he produced, besides comedies of general human character,² plays on subjects drawn from literary biography³ or from fiction.⁴ Goldoni, whose style was considered defective by the purists whom Italy has at no time lacked, met with a severe critic and a temporarily successful rival in Count C. Gozzi (1722-1806), who sought to rescue the comic drama from its association with the real life of the middle classes, and to infuse a new spirit into the figures of the old masked comedy by the invention of a new species. His themes were taken from Neapolitan⁵ and Oriental⁶ fairy tales, to which he accommodated some of the standing figures upon which Goldoni had made war. This attempt at mingling fancy and humour—occasionally of a directly satirical turn⁷—was in harmony with the tendencies of the modern romantic school, and Gozzi's efforts, which though successful found hardly any imitators in Italy, have a family resemblance to those of Tieck.

Gozzi.

Comedians
after Goldoni.

During the latter part of the 18th and the early years of the present century comedy continued to follow the course marked out by its acknowledged master Goldoni, under the influence of the sentimental drama of France and other countries. Villi, Nelli, the Marquis Albergati Capacelli, Sografi, Federici, and Signorelli (the historian of the drama) are mentioned among the writers of this school; to the present century belong Count Giraud, Marchisio (who took his subjects especially from commercial life), and Nota, a fertile writer, among whose plays are three treating the lives of poets. Of still more recent date are Bon and Brofferio. Though no recent Italian comedies have acquired so wide a celebrity as that which has been obtained by the successful productions of the recent French stage, there seems no reason to predict a barren future for Italian comedy any more than for Italian tragedy. Both the one and the other have survived periods of a seemingly hopeless decline; tragedy has been rescued from the pedantry of a timid classicism, and comedy from the conventionalism of its most popular but least progressive form; and neither the opera nor the ballet has succeeded in ousting from the national stage the legitimate forms of the national drama.

Modern
Greek
drama.

To the above summary of the history of the modern Italian drama it would not have been inappropriate to append a brief account of that of the MODERN GREEK. The dramatic literature of the later Hellenes is a creation of the literary movement which preceded their glorious

struggle for independence, or which may be said to form part of that struggle. After beginning with dramatic dialogues of a patriotic tendency, it took a step in advance with the tragedies of J. R. Nerulos⁸ (1778-1850), whose name belongs to the political as well as to the literary history of his country. His comedies—especially one directed against the excesses of journalism⁹—largely contributed to open a literary life for the modern Greek tongue. Among the earlier patriotic Greek dramatists of the present century are T. Alkæos, J. Zampelios (whose tragic style was influenced by that of Alfieri),¹⁰ S. K. Karydis, and A. Valaoritis. A. Zoiros¹¹ is noteworthy as having introduced the use of prose into Greek tragedy, while preserving to it that association with sentiments and aspirations which will probably long continue to pervade the chief productions of modern Greek literature. The love of the theatre is ineradicable from Attic as it is from Italian soil; and the tendencies of the young dramatic literature of Hellas seem to justify the hope that a worthy future awaits it.

SPANISH
DRAMA.

Italy produced many brilliant growths, from which the dramatic literatures of other nations largely borrowed; but SPAIN is the only country of modern Europe which shares with England the honour of having achieved, at a relatively early date, the creation of a genuinely national form of the regular drama. So proper to Spain was the form of the drama which she produced and perfected, that to it the term *romantic* has been specifically applied, though so restricted a use of the epithet is clearly unjustifiable. The influences which from the Romance peoples—in whom Christian and Germanic elements mingled with the legacy of Roman law, learning, and culture—spread to the Germanic nations were represented with the most signal force and fulness in the institutions of chivalry,—to which, in the words of Scott, "it was peculiar to blend military valour with the strongest passions which actuate the human mind, the feelings of devotion and those of love." These feelings, in their combined operation upon the national character, and in their reflection in the national literature, were not peculiar to Spain; but nowhere did they so long or so late continue to animate the moral life of a nation. Outward causes contributed to this result. For centuries after the crusades had become a mere memory, Spain was a battle ground between the cross and the crescent. And it was precisely at the time when the Renaissance was establishing new starting-points for the literary progress of Europe, that Christian Spain rose to the height of Catholic as well as national self-consciousness by the expulsion of the Moors and the conquest of the New World. From their rulers or rivals of so many centuries the Spaniards had derived that rich glow of colour which became permanently distinctive of their national life, and more especially of its literary and artistic expressions; they had also perhaps derived from the same source an equally characteristic refinement in their treatment of the passion of love. The ideas of Spanish chivalry—more especially religious devotion and a punctilious sense of personal honour—asserted themselves (according to a process often observable in the history of civilization) with peculiar distinctness in literature and art, after the great achievements to which they had contributed in other fields had already been wrought. The ripest glories of the Spanish drama belong to an age of national decay—mindful, it is true, of the ideas of a greater past. The chivalrous enthusiasm pervading so many of the master-pieces of its literature is indeed a characteristic of

the Spanish nation in all, even in the least hopeful, periods of its later history, and the religious ardour breathed by these works, though associating itself with what is called the Catholic Reaction, is in truth only a manifestation of the spirit which informed the noblest part of the Reformation movement itself. The Spanish drama neither sought nor could seek to emancipate itself from views and forms of religious life more than ever sacred to the Spanish people since the glorious days of Ferdinand and Isabella, and it is not in the beginnings but in the great age of Spanish dramatic literature that there is often most difficulty in distinguishing between what is to be termed a religious and what a secular play. After Spain had thus, the first after England among modern European countries, fully unfolded that incomparably richest expression of national life and sentiment in an artistic form—a truly national dramatic literature,—the terrible decay of her greatness and prosperity gradually impaired the strength of a brilliant but, of its nature, dependent growth. In the absence of high original genius the Spanish dramatists began to turn to foreign models, though little supported in such attempts by popular sympathy, and it is only in more recent times that the Spanish drama has sought to reproduce the ancient forms from whose master-pieces the nation had never become estranged, while accommodating them to tastes and tendencies shared by later Spanish literature with that of Europe at large.

Early efforts.

The earlier dramatic efforts of Spanish literature may without inconvenience be briefly dismissed. The reputed author of the *Couplets of Mingo Revulgo* (R. Cota the elder) likewise composed the first act of a story of intrigue and character, purely dramatic but not intended for representation. This tragic comedy of *Calisto and Melibea*, which was completed (in 21 acts) by 1499, afterwards became famous under the name of *Celestina*, it was frequently imitated and translated, and was adapted for the Spanish stage by R. de Zepeda in 1582. But the father of the Spanish drama was J. de la Encina (b. c. 1468), whose *representaciones* under the name of "eclogues" were dramatic dialogues of a religious or pastoral character. His attempts were imitated more especially by Gil Vicente (fl. 1502–1536), a Portuguese who wrote both in Spanish and in his native tongue—the dramatic literature of which is stated to have produced nothing of equal merit afterwards (The Portuguese literary drama is held to have begun with the prose comedies of Vicente's contemporary, F. de Sa de Miranda.) A further impulse came, as was natural, from Spaniards resident in Italy, and especially from B. de T. Naharro, who in 1517 published, as the chief among the "firstlings of his genius" (*Propaladia*), a series of eight comedies—a term generally applied in Spanish literature to any kind of drama. He claimed some knowledge of the theory of the ancient drama, divided his plays into *jornadas*¹ (to correspond to acts), and opened them with an *introyto* (prologue). Very various in their subjects, and occasionally odd in form,² they were gross as well as audacious in tone, and were soon prohibited by the Inquisition. The church remained unwilling to renounce her control over such dramatic exhibitions as she permitted, and sought to suppress the few plays on not strictly religious subjects which appeared in the early part of the reign of Charles I. The few translations published from the classical drama exercised no effect.

Thus the foundation of the Spanish national theatre was reserved for a man of the people. Cervantes has vividly

¹ The term is the same as that used in the old French collective mysteries (*jeueries*).

² In some of his plays (*Comedia Serafina*; *C. Tinclaria*) there is a mixture of languages even stranger than that of dialects in the Italian masked comedy.

sketched the humble resources which were at the command of Lope de Rueda (fl. 1544–1567), a mechanic of Seville, who with his friend the bookseller Timoneda, and two brother authors and actors in his strolling company, succeeded in bringing dramatic entertainments out of the churches and palaces into the public places of the towns, where they were produced on temporary scaffolds. The manager carried about his properties in a corn sack; and the "comedies" were still only "dialogues, and a species of eclogues between two or three shepherds and a shepherdess," enlivened at times by intermezzos of favourite comic figures, such as the negress or the Biscayan, "played with inconceivable talent and truthfulness by Lope." One of his plays at least,³ and one of Timoneda's,⁴ seem to have been taken from an Italian source, others mingled modern themes with classical apparitions;⁵ one of Timoneda's was (perhaps again through the Italian) from Plautus.⁶ Others of a slighter description were called *pasos*,—a species afterwards termed *entremeses* and resembling the modern French *proverbes*. With these popular efforts of Lope de Rueda and his friends a considerable dramatic activity began in the years 1560–1590 in several Spanish cities, and before the close of this period permanent theatres began to be fitted up at Madrid. Yet Spanish dramatic literature might still have been led to follow Italian in turning to an imitation of classical models. Two plays by G. Bermudez (1577), called by their learned author "the first Spanish tragedies," treating the national subject of Inez de Castro, but divided into five acts, composed in various metres, and introducing a chorus; a *Dido* (c. 1580) by C. de Virues (who claimed to have first divided dramas into three *jornadas*), and the tragedies of L. L. de Argensola (acted 1585, and praised in *Don Quixote*) alike pointed in this direction.

Classical dramas.

Such were the alternatives which had opened for the Spanish drama, when at last, about the same time as that of the English, its future was determined by writers of original genius. The first of these was the immortal Cervantes, who, however, failed to anticipate by his earlier plays (1584–1588) the great (though to him unproductive) success of his famous romance. In his endeavour to give a poetic character to the drama he fell upon the expedient of introducing personified abstractions speaking a "divine" or elevated language—a device which was for a time favourably received. But these plays exhibit a neglect or ignorance of the laws of dramatic construction, their action is episodic, and it is from the realism of these episodes (especially in the *Numancia*, which is crowded with both figures and incidents), and from the power and flow of the declamation, that their effect must have been derived. When in his later years (1615) Cervantes returned to dramatic composition, the style and form of the national drama had been definitively settled by a large number of writers, the brilliant success of whose acknowledged chief may previously have diverted Cervantes from his labours for the theatre. His influence upon the general progress of dramatic literature is, however, to be sought, not only in his plays, but also in those *novelas exemplares* to which more than one drama is indebted for its plot, and for much of its dialogue to boot.

Lope de Vega (1562–1635), one of the most astonishing geniuses the world has known, permanently established the national forms of the Spanish drama. Some of these were in their beginnings taken over by him from ruder predecessors; some were cultivated with equal or even superior success by subsequent authors, but in variety, as in fertility of dramatic production, he has no rivals. His

⁶ *Menenno*.

fertility, which was such that he wrote about 1500 plays, besides 300 dramatic works classed as *autos sacramentales* and *entremeses*, and a vast series of other literary compositions, has indisputably prejudiced his reputation with those to whom he is but a name and a number. Yet as a dramatist Lope more fully exemplifies the capabilities of the Spanish theatre than any of his successors, though as a poet Calderon may deserve the palm. Nor would it be possible to imagine a truer representative of the Spain of his age than a poet who, after suffering the hardships of poverty and exile, and the pangs of passion, sailed against the foes of the faith in the Invincible Armada, subsequently became a member of the Holy Inquisition and of the Order of St Francis, and after having been decorated by the Pope with the cross of Malta and a theological doctorate, honoured by the nobility, and idolized by the nation, ended with the names of Jesus and Mary on his lips. From the plays of such a writer we may best learn the manners and the sentiments, the ideas of religion and honour, of the Spain of the Philippine age, the age when she was most prominent in the eyes of Europe and most glorious in her own. For, with all its inventiveness and vigour, the genius of Lope primarily set itself the task of pleasing his public,—the very spirit of whose inner as well as outer life is accordingly mirrored in his dramatic works. In them we have, in the words of Lope's French translator Baret, "the movement, the clamour, the conflict of unforeseen intrigues suitable to unreflecting spectators; perpetual flatteries addressed to an unextinguishable national pride; the painting of passions dear to a people never tired of admiring itself, the absolute sway of the point of honour; the deification of revenge; the adoration of symbols; buffoonery and burlesque, everywhere beloved of the multitude, but here never defiled by obscenities, for this people has a sense of delicacy, and the foundation of its character is nobility; lastly, the flow of proverbs which at times escape from the *gracioso*" (the comic servant domesticated in the Spanish drama by Lope)—"the commonplace literature of those who possess no other."

Comedias
de capa
y espada.

Heróicas

The plays of Lope, and those of the national Spanish drama in general, are divided into classes which it is naturally not always easy, and which there is no reason to suppose him always to have intended, to keep distinct from one another. After in his early youth composing eclogues, pastoral plays, and allegorical moralities in the old style, he began his theatrical activity at Madrid about 1590, and the plays which he thenceforth produced have been distributed under the following heads. The *comedias*, all of which are in verse, include (1) the so-called *c. de capa y espada*—not comedies proper, but dramas the principal personages in which are taken from the class of society which wears cloak and sword. Gallantry is their main theme, an interesting and complicated, but well-constructed and perspicuous intrigue their chief feature; and this is usually accompanied by an underplot in which the *gracioso* plays his part. Their titles are frequently taken from the old proverbs or proverbial phrases of the people,¹ upon the theme suggested by which the plays often (as Mr Lewes admirably expresses it) constitute a kind of gloss (*glosa*) in action. This is the favourite species of the national Spanish theatre; and to the plots of the plays belonging to it the drama of other nations owes a debt almost incalculable in extent. (2) The *c. heróicas* are distinguished by some of their personages being of royal or very high rank, and by their themes being often historical and largely² (though not

invariably³) taken from the national annals, or founded on contemporary or recent events.⁴ Hence they exhibit a greater gravity of tone; but in other respects there is no difference between them and the cloak and sword comedies with which they share the element of comic underplots. Occasionally Lope condescended in the opposite direction, to (3) plays of which the scene is laid in common life, but for which no special name appears to have existed.⁵ Meanwhile, both he and his successors were too devoted Religious sons of the church not to acknowledge in some sort her claim to influence the national drama. This claim she had never relinquished, even when she could no longer retain an absolute control over the stage. For a time, indeed, she was able to reassert even this, for the exhibition of all secular plays was in 1598 prohibited by the dying Philip II., and remained so for two years; and Lope with his usual facility proceeded to supply religious plays of various kinds. After a few dramas on scriptural subjects he turned to the legends of the saints; and the *comedias de santos*, of which he wrote a great number, became an accepted later Spanish variety of the miracle-play. True, however, to the popular instincts of his genius, he threw himself with special zeal and success into the composition of another kind of religious plays—a development of the Corpus Christi pageants, in honour of which all the theatres had to close their doors for a month. These were the famous *autos sacramentales* (i.e., solemn "acts" or proceedings in honour of the Sacrament), which were performed in the open air by actors who had filled the cars of the sacred procession. Of these Lope wrote about 400. These entertainments were arranged on a fixed scheme, comprising a prologue in dialogue between two or more actors in character (*loa*), a farce (*entremes*), and the *auto* proper, an allegorical scene of religious purport, as an example of which Ticknor cites the *Bridge of the World*,—in which the Prince of Darkness in vain seeks to defend the bridge against the Knight of the Cross, who finally leads the Soul of Man in triumph across it. Not all the *Entremeses* of Lope and others were, however, composed for insertion in these *autos*. This long-lived popular species, together with the old kind of dramatic dialogue called *eclogues*, completes the list of the varieties of his dramatic works.

The example of Lope was followed by a large number The of writers, and Spain thus rapidly became possessed of a of Lope. dramatic literature almost unparalleled in quantity—for in fertility also Lope was but the first among many. Among the writers of Lope's school, his friend G. de Castro (1569–1631) must not be passed by, for his *Cid*⁶ was the basis of Corneille's; nor J. P. de Montalvan (1602–1638), "the first-born of Lope's genius," the extravagance of whose imagination, like that of Lope, culminated in madness. Soon after him died (1639) Ruiz de Alarcon, in whose plays, as contrasted with those of Lope, has been recognized the distinctive element of a moral purpose. To G. Tellez, called Tirso de Molina (d. 1648), no similar praise seems due; but the frivolous gaiety of the inventor of the complete character of Don Juan was accompanied by ingenuity in the construction of his excellent⁷ though at times "sensational"⁸ plots. F. de Roxas y Zorilla (b. 1607), who was largely plundered by the French dramatists of the latter half of the century, survived Molina for about a generation. In vain scholars

of strictly classical tastes protested in essays in prose and verse against the ascendancy of the popular drama; the prohibition of Philip II. had been recalled two years after his death and was never renewed; and the activity of the theatre spread through the towns and villages of the land, everywhere under the controlling influence of the school of writers who had established so complete a harmony between the drama and the tastes and tendencies of the people.

The glories of Spanish dramatic literature reached their height in P. Calderon de la Barca (1600-1681), though in the history of the Spanish theatre he holds only the second place. He elaborated some of the forms of the national drama, but brought about no changes of moment in any of them. Even the brilliancy of his style, glittering with a constant reproduction of the same family of tropes, and the variety of his melodious versification, are mere intensifications of the poetic qualities of Lope, while in their moral and religious sentiments, and their general views of history and society, there is no difference between the two. Like Lope, Calderon was a soldier in his youth and an ecclesiastic in his later years; like him he suited himself to the tastes of both court and people, and applied his genius with equal facility to the treatment of religious and of secular themes. In fertility he was inferior to Lope (for he wrote not many more than 100 plays), but he surpasses the elder poet in richness of style, and more especially in fire of imagination. In his *autos* (of which he is said to have left not less than 73), Calderon probably attained to his most distinctive excellence; some of these appear to take a wide range of allegorical invention,¹ while they uniformly possess great beauty of poetical detail. Other of his most famous or interesting pieces are *comedias de santos*.² In his secular plays Calderon treats as wide a variety of subjects as Lope, but it is not a dissimilar variety; nor would it be easy to decide whether a poet so uniformly admirable within his limits has achieved greater success in romantic historical tragedy,³ in the comedy of amorous intrigue,⁴ or in a dramatic work combining fancy and artificiality in such a degree that it has been diversely described as a romantic caprice and as a philosophical poem.⁵

During the life of the second great master of the Spanish drama there was little apparent abatement in the productivity of its literature: while the *autos* continued to flourish in Madrid and elsewhere, till in 1765 (shortly before the expulsion of the Jesuits from Spain) their public representation was prohibited by royal decree. In the world of fashion, the opera had reached Spain already during Calderon's lifetime, together with other French influences, and the great dramatist had himself written one or two of his plays for performance with music. But the regular national drama continued to command popular favour; and with A. Moreto (1618-1669) may be said to have even taken a fresh step. While he wrote in all the forms established by Lope and cultivated by Calderon, his manner seems most nearly to approach the master-pieces of French and later English comedy of character; he was the earliest writer of the *comedias de figuron*, in which the most prominent personage is (in Congreve's phrase) "a character of affectation," in other words, the Spanish fop of real life.⁶ His master-piece, a favourite of many stages, is one of the most graceful and pleasing of modern comedies—simple but interesting in plot, and true to nature, with something like Shakespearean truth.⁷ Other writers trod

more closely in the footsteps of the masters without effecting any noticeable changes in the form of the Spanish drama; even the *saynete* (tit-bit), which owes its name to Benavente (fl. 1645), was only a kind of *entremes*. The Spanish drama in all its forms retained its command over the nation, because they were alike popular in origin and character; nor is there any other example of so complete an adaptation of a national art to the national taste and sentiment in its ethics and æsthetics, in the nature of the plots of the plays (whatever their origin), in the motives of their actions, in the conduct and tone and in the very costume of their characters.

National as it was, and because of this very quality, the Spanish drama was fated to share the lot of the people it so fully represented. At the end of the 17th century, when the Spanish throne at last became the declared apple of discord among the Governments of Europe, the Spanish people lay, in the words of a historian of its later days, "like a corpse, incapable of feeling its own impotence." That national art to which it had so faithfully clung had fallen into decline and decay with the spirit of Spain itself. By the time of the close of the great war, the theatre had sunk into a mere amusement of the populace, which during the greater part of the 18th century, while allowing the old masters the measure of favour which accords with traditional esteem, continued to uphold the representatives of the old drama in its degeneracy—authors on the level of their audiences. But the Spanish court was now French, and France in the drama, even more than in any other form of art, was the arbiter of taste in Europe. With the restoration of peace accordingly began isolated attempts to impose the French canons of dramatic theory, and to follow the example of French dramatic practice; and in the middle of the century these endeavours assumed more definite form. Montiano's bloodless tragedy of *Virginia* (1750), which was never acted, was accompanied by a discourse endeavouring to reconcile the doctrines of the author with the practice of the old Spanish dramatists; the play itself was in blank verse (a metre never used by Calderon, though occasionally by Lope), instead of the old national ballad-measures (the romance-measure with assurance and the rhymed *redondilla* quatrain) preferred by the old masters among the variety of metres employed by them. The earliest Spanish comedy in the French form (a translation only, though written in the national metre)⁸ (1751), and the first original Spanish comedy on the same model, Moratin's *Petimetra* (*Petite-Maitresse*), printed in 1726 with a critical dissertation, likewise remained unacted. In 1770, however, the same author's *Hormesinda*, an historic drama on a national theme and in the national metre, but adhering to the French rules, appeared on the stage; and similar attempts followed in tragedy by the same writer and others (including Ayala, who ventured in 1775 to compete with Cervantes on the theme of *Nimantia*), and in comedy by Yriarte and Jovellanos (afterwards minister under Godoy), who produced a sentimental comedy in Diderot's manner.⁹ But these endeavours failed to effect any change in the popular theatre, which was with more success raised from its deepest degradation by R. de la Cruz (b. 1731), a fertile author of light pieces of genuine humour, especially *saynetes*, depicting the manners of the middle and lower classes. In literary circles La Huerta's voluminous collection of the old plays (1785) gave a new impulse to dramatic productivity, and the conflict continued between representatives of the old school, such as Comella (fl. 1780) and of the new, such as the younger Moratin (1760-1828), whose comedies—of which the last

and most successful¹ was in prose—raised him to the foremost position among the dramatists of his age. In tragedy *N. de Cienfuegos* (d. 1809) likewise showed some originality. After, however, the troubles of the French domination and the war had come to an end, the precepts and examples of the new school failed to reassert themselves. The Spanish dramatists of the present century, after passing, as in the instances of F. Martinez de la Rosa and Breton de los Herreros, from the system of French comedy to the manner of the national drama, appear either to have stood under the influence of the French romantic school, or to have returned once more to the old national models. Among the former class A. Gil y Zarate, among the latter J. Zorilla, are mentioned as specially prominent. Meanwhile the old popular religious performances are not wholly extinct in Spain, and their relics may long continue to survive there. Whatever may be the future history of one of the most remarkable of dramatic literatures, it may confidently be predicted that so long as Spain is Spain, her theatre will not be permanently denationalized, and that the revolutions it may be destined to undergo are unlikely to extinguish, in whatever degree they may repress, its conservative elements.

The
French
regular
drama.

Jodelle

The beginnings of the regular drama in FRANCE, which here, without absolutely determining, potently swayed its entire course, sprang directly from the literary movement of the Renaissance. DuBelay sounded the note of attack which converted that movement in France into an endeavour to transform the national literature; and in Ronsard the classical school of poetry put forward its conquering hero and sovereign lawgiver. Among the disciples who gathered round Ronsard, and with him formed the "Pleiad" of French literature, Stephen Jodelle (1532–1572), the reformer of the French theatre, soon held a distinguished place. The stage of this period left ample room for the enterprise of this youthful writer. The popularity of the old entertainments had reached its height when Louis XII., in his conflict with Pope Julius II., had not scrupled to call in the aid of Pierre Grégoire (Gringore), and when the *Mère Sotte* had mockingly masqueraded in the petticoats of Holy Church. Under Francis I. the Inquisition had to some extent succeeded in repressing the audacity of the actors, whose follies were at the same time an utter abomination in the eyes of the Huguenots. For a time the very mysteries had been prohibited. Meanwhile, isolated translations of Italian² or classical³ dramas had in literature begun the movement which Jodelle now transferred to the stage itself. His tragedy, *Cléopâtre Captive*, was produced there on the same day as his comedy, *L'Eugène*, in 1552, his *Didon se sacrifiant* following in 1558. Thus at a time when a national theatre was perhaps impossible in a country distracted by civil and religious conflicts, whose monarchy had not yet welded together a number of provinces attached each to its own traditions, and whose population, especially in the capital, was enervated by frivolity or enslaved by fanaticism, was born that long-lived artificial growth, the so-called classical tragedy of France. For French comedy, though subjected to the same influences as tragedy, had a national basis upon which to proceed, and its history is partly that of a modification of old popular forms.

French
tragedy in
the 16th
century.

The history of French tragedy begins with the *Cléopâtre Captive*, in the representation of which the author, together with other members of the "Pleiad," took part. It is a tragedy in the manner of Seneca, devoid of action and

provided with a ghost and a chorus. Though mainly written in the five-foot Iambic couplet, it already contains passages in the Alexandrine metre, which soon afterwards *La Péruze* by his *Médée* (pr 1556) established in French tragedy, and which Jodelle employed in his *Didon*. Numerous tragedies followed in the same style by various authors, among whom Bounayn produced the first French regular tragedy on a subject neither Greek nor Roman,⁴ and the brothers De la Taille,⁵ and J. Grevin,⁶ distinguished themselves by their style. Though in the reign of Charles IX. a vain attempt was made by Filleul to introduce the pastoral style of the Italians into French tragedy⁷ (while the Brotherhood of the Passion was intermingling with pastoral plays its still continued reproductions of the old entertainments, and the religious drama making its expiring efforts), the classical school, in spite of all difficulties, prevailed. Monchrestien exhibited unusual vigour of rhetoric;⁸ and in R. Garnier (1545–1601) French tragedy reached the greatest height in nobility and dignity of style, as well as in the exhibition of dramatic passion, to which it attained before Corneille. In his tragedies⁹ choruses are still interspersed among the long Alexandrine tirades of the dialogue.

During this period, comedy had likewise been influenced by classical models; but the distance was less between the national farces and Terence, than between the mysteries and moralities, and Seneca and the Greeks. *L'Eugène* differs little in style from the more elaborate of the old farces; and while it satirizes the foibles of the clergy without any appreciable abatement of the old licence, its theme is the favourite burden of the French comic theatre of all times—*le coquage*. The examples, however, which directly facilitated the productivity of the French comic dramatists of this period, among whom Jeandela Taille was the first to attempt a regular comedy in prose,¹⁰ were those of the Italian stage, which in 1576 established a permanent colony in France, destined to survive there till the close of the 17th century, by which time it had adopted the French language, and was ready to coalesce with French actors, without, however, relinquishing all remembrance of its origin. R. Belleau (1528–1577), a member of the "Pleiad," produced a comedy in which the type (already approached by Jodelle) of the swaggering captain appears,¹¹ J. Grevin copied Italian intrigue, characters, and manners,¹² O. de Turnèbe (d. 1581) borrowed the title of one Italian play¹³ and perhaps parts of the plots of others, the Florentine F. d'Amboise (d. 1558) produced versions of two Italian comedies,¹⁴ and the foremost French comic poet of the century, P. de Larivey (1550–1612), likewise an Italian born (of the name of Pietro Giunto), openly professed to imitate the poets of his native country. His plays are more or less literal translations of L. Dolce,¹⁵ Secchi,¹⁶ and other Italian dramatists; and this lively and witty author, to whom Molière owes much, thus connects two of the most important and successful growths of the modern comic drama.

Before, however, either tragedy or comedy in France entered into the period of their history when genius was to illuminate both with creations of undying merit, they had, together with the general literature of the country, passed through a new phase of the national life. The troubles and terrors of the great civil and religious wars of the 16th century had in certain spheres of society produced a reaction towards culture and refinement; and the seal had been set upon the results of the Renaissance by Malherbe, the

father of French style. The people continued to solace or distract its weariness and its sufferings with the help of the ministers of that half-cynical gaiety which has always lighted up the darkest hours of French popular life. In the troublous days preceding Richelieu's definitive accession to power (1624) the *Tabarinades*—a kind of street dialogue recalling the earliest days of the popular drama—had made the Pont-Neuf the favourite theatre of the Parisian populace. Meanwhile the influence of Spain, which Henry IV. had overcome in politics, had throughout his reign and afterwards been predominant in other spheres, and not the least in that of literature. The *stilo culto*, of which Gongora was the native Spanish, Marino the Italian, and Lyly the English representative, asserted its dominion over the favourite authors of French society; the pastoral romance of Honoré d'Urfé—the text-book of pseudo-pastoral gallantry—was the parent of the romances of the Scudérys and De la Calprenède; the Hôtel de Rambouillet was in its glory; the true (not the false) *précieuses* sat on the heights of intellectual society; and Balzac (ridiculed in the earliest French dramatic parody¹) and Voiture were the dictators of its literature. Much of the French drama of this age is of the same kind as its romance-literature, like which it fell under the polite castigation of Boileau's satire. Heroic love (quite a technical passion), "fertile in tender sentiments," seized hold of the theatre as well as of the romances; and Calprenède (1610–1663), G. de Scudéry² (1601–1667) and his sister (1607–1701), and others were equally fashionable in both species. Meanwhile Spanish and Italian models continued to influence both branches of the drama. Everybody knew by heart Gongora's version of the story of "young Pyramus and his love Thisbe" as dramatized by Th. Viaud (1590–1626); and the sentiment of Tristan³ (1601–1655) overpowered Herod on the stage, and drew tears from Cardinal Richelieu in the audience. Even Duryer's (1609–1659) style, otherwise superior to that of his contemporaries, is stated to have been Italian in its defects. A mixture of the forms of classical comedy with elements of Spanish and of the Italian pastoral was attempted with great temporary success by A. Hardi (1560–1631), a playwright who thanked Heaven that he knew the precepts of his art while preferring to follow the demands of his trade. The mixture of styles begun by him was carried on by Racan (1589–1670), Rotrou (1609–1650), and others, and among these comedies of intrigue in the Spanish manner the earliest efforts of Corneille himself⁴ are to be classed. Rotrou's noteworthy productions⁵ are later in date than the event which marks an epoch in the history of the French drama, the appearance of Corneille's *Cid* (1636).

Corneille.

His
tragedies.

P. Corneille (1606–1684) is justly revered as the first, and in some respects the unequalled, great master of French tragedy, whatever may have been unsound in his theories, or defective in his practice. The attempts of his predecessors had been without life, because they lacked really tragic characters and the play of really tragic passions, while their style had been either pedantically imitative or a medley of plagiarisms. He conquered tragedy at once for the national theatre and for the national literature, and this not by a long tentative process of production, but by a few master-pieces,—for in his many later tragedies he never again proved fully equal to himself. The French tragedy, of which the great age begins with the *Cid*, *Horace*, *Cinna*, and *Polyeucte*, was not, whatever it professed to be, a copy of the classical tragedy of Greeks or Romans, or an imitation of the Italian imitations of these; nor, though in

his later tragedies Corneille depended less and less upon characters, and more and more, after the fashion of the Spaniards, upon situations, were the forms of the Spanish drama able to assert their dominion over the French tragic stage. The mould of French tragedy was cast by Corneille; but the creative power of his genius was unable to fill it with more than a few examples. His range of passions and characters was limited; he preferred, he said, the reproach of having made his women too heroic to that of having made his men effeminate. His actions inclined too much to the exhibition of conflicts political rather than broadly ethical in their significance. The defects of his style are of less moment; but in this, as in other respects, he was, with all his strength and brilliancy, not one of those rarest of artists who are at once the example and the despair of their successors.

In comedy also Corneille begins the first great original epoch of French dramatic literature; for it was to him that comedies, Molière owed the inspiration of the tone and style which he made those of the higher forms of French comedy. But *Le Menteur* (the parent of a numerous dramatic progeny⁶) was itself derived from a Spanish original,⁷ which it did not (as was the case with the *Cid*) transform into something new. French tragi-comedy Corneille can hardly be said to have invented; and of the mongrel growth of sentimental comedy, domestic drama or *drame*, he rather suggested than exemplified the conditions.

The tragic art of Racine (1639–1699) supplements Racine. rather than surpasses that of his older contemporary. His works reflect the serene and settled formality of an age in which the sun of monarchy shone with an effulgence no clouds seemed capable of obscuring, and in which the life of a nation seemed reducible to the surroundings of a court. The tone of the poetic literature of such an age is not necessarily unreal, because the range of its ideas is limited, and because its forms seem to exist by an immutable authority. Madame de Sévigné said of Racine, whose plays so well suit themselves to the successive phases in the life of Louis XIV., that in his later years he loved God as he had formerly loved his mistresses, and thus sally at all events indicates the range of passions which inspired his tragic muse. His heroes are all of one type—that of a gracious gloriousness, his heroines vary in their fortunes, but they are all the "trophy of love,"⁸ with the exception of the scriptural figures, which stand apart from the rest.⁹

T. Corneille (1625–1709), Campistron, Duché, Lafosse, Followers and Quinault (1637–1688) were mere followers of one or both of the great masters of tragedy, though the last-named achieved a reputation of his own in the bastard species of the opera. The form of French tragedy thus established, like everything else which formed part of the "age of Louis XIV.," proclaimed itself as the definitively settled model of its kind, and was accepted as such by a submissive world. Proud of its self-imposed fetters, French tragedy dictatorially denied the liberty of which it had deprived itself to the art of which it claimed to furnish the highest examples. Yet, though calling itself classical, it had not caught the essential spirit of the tragedy of the Greeks. The elevation of tone which characterizes the serious drama of the age of Louis XIV. is a real elevation, but its heights do not lose themselves in a sphere peopled by the myths of a national religion. Its personages are conventional like its themes, but the convention is with itself only; Orestes and Iphigenia have not brought with them the cries of the stern goddesses and the flame on the altar of Artemis; their passions like their

speech are cadenced by a modern measure. In construction, the simplicity and regularity of the ancient models are stereotyped into a rigid etiquette by the exigencies of the court-theatre, which is but an apartment of the palace. The unities of time and place, with the Greeks mere rules of convenience, French tragedy imposes upon itself as a permanent yoke. The Euripidean prologue is judiciously exchanged for the exposition of the first act, and the lyrical element essential to Greek tragedy is easily suppressed in its would-be copy; lyrical passages still occur in some of Corneille's early master-pieces,¹ but the chorus is consistently banished, to reappear only in Racine's latest works² as a scholastic experiment appropriate to a conventual atmosphere. Its uses for explanation and comment are served by the expedient, which in its turn becomes conventional, of the conversations with *confidants* and *confidantes*, which more than sufficiently supply the foil of general sentiments. The epical element is allowed full play in narrative passages, more especially in those which relate parts of the catastrophe,³ and, while preserving the stage intact from realisms, suit themselves to the generally rhetorical character of this species of the tragic drama. This character impresses itself more and more upon the tragic art of a rhetorical nation in an age when the loftiest themes are elsewhere (in the pulpit) receiving the most artistic oratorical treatment, and develops in the style of French tragedy the qualities which cause it to become something between prose and poetry—or to appear (in the phrase of a French critic) like prose in full dress. The force of this description is borne out by the fact that the distinction between the versification of French tragedy and that of French comedy is at times an imperceptible one.

Voltaire.

The universal genius of Voltaire (1694–1778) found it necessary to shine in all branches of literature, and in tragedy to surpass predecessors whom his own authority declared to have surpassed the efforts of the Attic muse. He succeeded in impressing the world with the belief that his innovations had imparted a fresh vitality to French tragedy; in truth, however, they represent no essential advance in art, but rather augmented the rhetorical tendency which paralyzes true dramatic life. Such life as his plays possess lies in their political and social sentiments, their invective against tyranny,⁴ and their exposure of fanaticism.⁵ In other respects his versatility was barren of enduring results. He might take his themes from French history,⁶ or from Chinese,⁷ or Egyptian,⁸ or Syrian,⁹ from the days of the Epigoni¹⁰ or from those of the Crusades,¹¹ he might appreciate Shakespeare, with a more or less partial comprehension of his strength, and condescendingly borrow from and improve the barbarian.¹² But he added nothing to French tragedy where it was weakest—in character; and where it was strongest—in diction—he never equalled Corneille in fire or Racine in refinement. While the criticism to which French tragedy in this age at last began to be subjected has left unimpaired the real titles to immortality of its great masters, the French theatre itself has all but buried in respectful oblivion the dramatic works bearing the name of Voltaire—a name second to none in the history of modern progress and of modern civilization.

French classical tragedy in its decline.

As it is of relatively little interest to note the ramifications of an art in its decline, the contrasts need not be pursued among the contemporaries of Voltaire, between his

imitator Saurin (1706–1781), Saurin's royalist rival De Belloy (1727–1775), Racine's imitator Lagrange-Chancel (1676–1758), and Voltaire's own would-be rival, the "terrible" Crébillon the elder (1674–1762), who professed to vindicate to French tragedy, already mistress of the heavens through Corneille, and of the earth through Racine, Pluto's supplementary realm, but who, though thus essaying to carry tragedy lower, failed to carry it further. In the latter part of the 18th century French classical tragedy as a literary growth was dying a slow death, however numerous might be the leaves which sprouted from the decaying tree. Its form had been permanently fixed; and even Shakespeare, as manipulated by Ducis¹³ (1733–1816)—an author whose tastes were better than his times—failed to bring about a change. "It is a Moor, not a Frenchman, who has written this play," cried a spectator of Ducis's *Othello* (1791), but though Talma might astonish the theatre, Shakespeare's influence over the French drama was only gradually preparing itself, by means more especially of Letourneur's translation (1776–1782), which attracted the sympathy of Diderot and the execrations of the aged Voltaire. The command which classical French tragedy continued to assert over the stage was due in part, no doubt, to the love of Roman drapery which in more than one sense characterized the Revolution, and which was by the Revolution handed down to the Empire. It was likewise, and more signally, due to the great actors who freed the tragic stage from much of its artificiality and animated it by their genius. No great artist has ever more generously estimated the labours of a predecessor than Talma (1763–1826) judged those of Le Kain (1728–1778); but it was Talma himself whose genius was pre-eminently fitted to reproduce the great figures of antiquity in the mimic world, which, like the world outside, both required and possessed its Cæsar. He, like Rachel (1821–1858) after him, reconciled French classical tragedy with nature; and it is upon the art of great original actors such as these that the theatrical future of this form of the drama in France depends. Mere whims of fashion—even when inspired by political feeling—will not waft back to it a real popularity; nor will occasional literary aftergrowths, however meritorious, such as the effective *Lucrèce* of F. Ponsard, and the attempts of even more recent writers, suffice to re-establish a living union between it and the progress of the national literature.

The rival influences under which classical tragedy has become a thing of the past in French literature connect themselves with the history of French comedy, which under the co-operation of other influences produced a wide variety of growths. The germs of most of these—though not of all—are to be found in the works of the most versatile, and, in some respects, the most consummate comic dramatist the world has known,—Molière (1622–1693). Molière. What Molière found in existence was a comedy of intrigue, derived from Spanish or Italian examples, and the elements of a comedy of character, in French and more especially in Italian farce and ballet-pantomime. Corneille's *Menteur* had pointed the way to a fuller combination of character with intrigue, and in this direction Molière's genius exercised the height of its creative powers. After beginning with farces, he produced in the earliest of his plays (from 1652), of which more than fragments remain, comedies of intrigue which are at the same time marvelously lively pictures of manners, and then proceeded with the *École des Maris* (1661) to begin a long series of master-pieces of comedy of character. Yet even these, the chief of which are altogether unrivalled in dramatic literature, do not exhaust the variety of his productions. To define the

range of his art is as difficult as to express in words the essence of his genius. For though he has been copied ever since he wrote, neither his spirit nor his manner has descended in full to any of his copyists, whole schools of whom have missed elements of both. A Molière can only be judged in his relations to the history of comedy at large. He was indeed the inheritor of many forms and styles—remaining a stranger to those of Old Attic comedy only, rooted as it was in the political life of a free imperial city; though even the rich extravagance of Aristophanes's burlesque was not left wholly unreproduced by him. Molière is both a satirist and a humourist, he displays at times the sentiments of a loyal courtier, at others that gay spirit of opposition which is all but indispensable to a popular French wit. His comedies offer elaborate and subtle—even tender—pictures of human character in its eternal types, lively sketches of social follies and literary extravagances, and broad appeals to the ordinary sources of vulgar merriment. Light and perspicuous in construction, he is master of the delicate play of irony, the penetrating force of wit, and the expansive gaiety of frolicsome fun. Faithful to the canons of artistic taste, and under the safe guidance of true natural humour, his style suits itself to every species attempted by him. His morality is the reverse of rigid, but its aberrations are not those of prudence, nor its laws those of pretence; and wholly free as he was from the didactic aim which is foreign to all true dramatic representation, the services he rendered to his art are not the less services rendered to society, concerning which the laughter of true comedy tells the truth. He raised the comedy of character out of the lower sphere of caricature, and in his greatest creations subordinated to the highest ends of all dramatic composition the plots he so skilfully built, and the pictures of the manners he so faithfully reproduced.

Molière's
contem-
poraries
and
successors

Even among the French comic dramatists of this age there must have been many who "were not aware" that Molière was its greatest poet. For though he had made the true path luminous to them, their efforts were still often of a tentative kind, and one was reviving *Patelin* while another was translating the *Andria*. A more unique attempt was made in one of the very few really modern versions of an Aristophanic comedy, which deserves to be called an original copy—*Les Plaideurs* of Racine. The tragic poets Quinault and Campistron likewise wrote comedies, one¹ or more of which furnished materials to contemporary English dramatists, as did one of the felicitous plays in which Boursault (1638–1701) introduced Mercury and Æsop into the theatrical *salon*.² But if the mantle of Molière can be said to have fallen upon any of his contemporaries or successors, this honour must be ascribed to J. F. Regnard (1655–1709), who imitated the great master in both themes and characters,³ while the skilfulness of his plots, and his gaiety of the treatment even of subjects tempting into the by-path of sentimental comedy,⁴ entitle him to be regarded as a comic poet of original genius. In the next generation (that of Voltaire) this by-path threatened to become the chosen walk of comedy, though Gresset (1709–1777) still attempted comedy of character,⁵ and the witty Piron (1689–1778) produced something like a new type in the hero of his epigrammatic, but hardly dramatic, *Métromanie*. Marivaux (1688–1763), "the French

Spectator," whose minute analysis of the tender passion⁶ excited the scorn of Voltaire, forms the connecting link between comedy and the mixed species of the sentimental or "tearful" domestic drama, which still retained the name, but no longer pursued the ends, of the comic art. The Sentimental comedy and the domestic drama. The most effective and professedly didactic dramatic moralists of this school were Destouches⁷ (1680–1754) and Nivelle de la Chaussée (1692–1754), in whose hands French comedy became a champion of the sanctity of marriage⁸ and reproduced the sentiments—in one instance⁹ even the characters—of Richardson.

Melpomene, humbly shod with the sock, and Thalia, dissolved in tears, had now entered into partnership. The species which varied as *comédie larmoyante* or as *tragédie bourgeoise*, and which ruled or was to rule supreme in so many dramatic literatures of Europe, more and more firmly established its hold on that of France. In the hands of Diderot (1713–1784) it sought to proclaim itself as an agent of social reform, and as an apostle of the gospel of philanthropy; but the execution of these works fell short of their aims;¹⁰ it was, in Mme. de Staël's words, "the affectation of nature," not nature itself which they exhibited. Their author announced them as examples of a third dramatic form—the *genre sérieux*—which he declared to be the consummation of the dramatic art. Making war upon the frigid artificiality of classical tragedy, he banished verse from the new species. The effect of these plays was intended to spring from their truth to nature—a truth such as no spectator could mistake, and which should bring home its moral teachings to the business as well as the bosoms of all. The theatre was to become a real and realistic school of the principles of society and of the conduct of life—it was, in other words, to usurp functions with which it has no concern, and to essay the reformation of mankind. The idea was neither new nor just, but its speciousness will probably continue to commend it to many benevolent minds, whensoever and in whatsoever shape it is revived.

From this point the history of the French drama becomes that of a conflict between an enfeebled artistic school and a tendency which is hardly to be dignified by the name of a school at all. Beaumarchais (1732–1799), who for his early sentimental plays, in which he imitated Diderot, invented the appellation *drame*—so convenient in its vagueness that it became the accepted name of the hybrid species to which they belonged—in two works of a very different kind, the famous *Barbier de Séville* and the still more famous *Mariage de Figaro*, boldly carried comedy back into its old Spanish atmosphere of intrigue; but while surpassing all his predecessors in the skill with which he constructed his frivolous plots, he drew his characters with a lightness and sureness of touch peculiar to himself, animated his dialogue with an unparalleled brilliancy of wit, and seasoned action as well as dialogue with a political and social meaning, which caused his epigrams to become proverbs, and which marks his *Figaro* as a herald of the Revolution. Such plays as these were ill suited to the rule of the despot whose vigilance could not overlook their significance. The comedy of the empire is, in the hands of Collin d'Harleville, Picard, A. Duval, Étienne, and others, mainly a harmless comedy of manners; nor was the attempted innovation of N. Lemercier (1771–1840)—who was fain to invent a new species, that of historical comedy—more than a flattering self-delusion. The theatre had its share in all the movements and changes which ensued in

France; but the impulse which gave rise to the revolution the drama itself was to undergo was not one of native origin. Those branches of the drama which belong specifically to the history of the opera, or which associate themselves with it, are here passed by. (See OPERA). Among them was the *vaudeville* (from Val de Vire in Calvados), which began as an interspersion of pantomime with the airs of popular songs, and which, after the Italian masks had been removed from it, was cultivated by Ponsard (1690-1765) and Marmontel (1723-1799). The latter,¹ as well as Rousseau,² likewise composed *opérettes*—a smaller kind of opera, at first of the pastoral sort; and these flexible species easily entered into combination. The melodrama proper, of which the invention is also attributed to Rousseau,³ in its latter development became merely a drama accentuated by music, though usually in little need of any accentuation.

Vaude-
villes, &c

The stage.

The chief home of the regular drama, however, demanded efforts of another kind. At the Théâtre Français, or Comédie Française, whose history as that of a single company of actors had begun in 1680, the party-strife of the times made itself audible; and the most prominent tragic poet of the Revolution, M. J. de Chénier (1764-1811), a disciple of Voltaire in dramatic poetry as well as in political philosophy, wrote for the national stage the historical drama—with a political moral⁴—in which in the memorable year 1789 Talma achieved his first complete triumph. But the victorious Revolution proclaimed among other liberties that of the theatres in Paris, of which soon not less than 50 were open. In 1807 the empire restricted the number to 9, and reinstated the Théâtre Français in sole possession (or nearly such) of the right of performing the classic drama. No writer of note was, however, tempted or inspired by the rewards and other encouragements offered by Napoleon to produce such a classic tragedy as the emperor would have willingly stamped out of the earth. The tragedies of C. Delavigne (1794-1844) represent the transition from the expiring efforts of the classical to the ambitious beginnings of the romantic school of the French drama. Of this it must suffice to say that it derives some of its characteristics from the general movement of romanticism which in various ways and at various points of time transformed nearly every modern European literature, others from the rhetorical tendency which is a French national feature. Victor Hugo was its conquering founder; A. Dumas the elder (1803-1870) its middleman. The marvellous energy and poetic genius of the former, always in extremes, was nowhere more signally so than in the drama; the latter was a Briareus, working with many hands besides his own. The name of A. de Vigny (1799-1863), "George Sand" (1804-1876), A. de Musset (1810-1857), whose dramatic "proverbes" and other pieces of a similar kind have a delicate flavour all their own, and perhaps that of P. Mérimée (1803-1870), who invented not only Spanish dramas but a Spanish dramatist,⁵ may be all with more or less precision classed in the romantic school, which in its turn has come to an end as a productive body of writers. It was not, however, the brief classical revival begun by F. Ponsard, and continued, in closer relation to modern ideas, both by him and by E. Augier, which overthrew the Romanticists. While the theatrical ability of E. Scribe (1791-1858) supplied a long series of productions attesting the rapid advance of the playwright's mastery over the secrets of his craft, and while the name of his competitors, with the aid of some of whom he held his own against the rest, is legion, the latest developments of the French drama

possess a social and often a moral interest of greater depth, while they are not inferior in technical skill to anything that has preceded them. After a fashion which would have startled even Diderot, the younger A. Dumas has undertaken to reform society by means of the stage; O. Fenillet and others have, with perhaps fewer prefaces, applied themselves to the solution of the same "problems;" and whatever style will best succeed with the public is the style of V. Sardou.

That the theatre will lose the hold it possesses over the intellectual and moral sympathies of nearly the whole of the educated, and of a great part of the uneducated population of France, seems hardly within the range of probability. But this is not tantamount to a prophecy that the creative activity of French dramatic literature is certain to endure. The art of acting is not dependent upon a contemporary literary productivity; Talma and Mlle Mars (1779-1847) flourished in one of the most barren ages of the French literary drama; the authors and actors of the *sotties*, like those of the *Palais Royal* farces of our own day, could strike their roots in the lightest of soils. The constantly accumulating experience and the apparently inexhaustible fertility of the art of acting in France may ensure to it a future not less brilliant than its past; and the judicious policy of not leaving the leading theatres at the mercy of shifting fashion will at all events supply the possibility of maintaining a high histrionic standard. So long as the French nation continues to maintain its ascendancy over other nations in much that adorns and brightens social life, the predominant influence of the French theatre over the theatres of other nations is likewise assured. But in the end its own future must be ruled by that progress or decay of French dramatic literature. The history of that literature shows periods of marvellously rapid advance, of hardly less swift decline, and of frequent though fitful recovery. Its future may be equally varied; but it will not be less dependent on the conditions which in every people, ancient or modern, are indispensable to national vigour and vitality. Should the calamity—for it would be nothing less—befall modern civilization of a hopeless degeneration of the French drama, the fault will lie in the severance of self-consciousness from self-control; and, under other circumstances, but with even deeper regret, the story of the Roman theatre of the later Empire may have to be told again.

The fu-
of the
French
theatre
of the
French
drama.

Among the nations of Germanic descent, but one—our own—succeeded under the influence of the Renaissance movement in transforming the last growths of the mediæval drama into the beginnings of a great and enduring national dramatic literature. This transformation connects itself with one of the greatest epochs of the national history, or, more properly speaking, forms part of it; the Elizabethan drama and the Elizabethan age are, it is no exaggeration to assert, equally inconceivable the one without the other.

It has been seen how already in the reign of Edward VI., the breath of a new age with its "new learning" had quickened the relatively inanimate species of the morality into the first *chronicle history* (still intermingled with remnants of the earlier species); and how at an even earlier date John Heywood's *interludes* had bridged the distance separating from only partially relieved abstractions the concrete directness of comedy proper. Soon afterwards, the study and imitation of the ancient classical drama were introduced into the English world of letters; and under their influence tragedy and comedy, which might otherwise have from the first coalesced, were in their early growths in our literature kept asunder, though not absolutely so. Already, in Queen Mary's reign, translation was found the readiest form of expression offering itself to literary scholar-

Earliest
tragedies.

ship, and Italian examples helped to commend Seneca, the most modern of the ancient tragedians, as a favourite author for such exercises. With the year of Elizabeth's accession began a series of translations of his plays by Jasper Heywood (John Heywood's son) and others; and to the direct influence of one of Seneca's tragedies¹ is to be ascribed the composition of the first tragedy proper in the English tongue, the *Gorboduc* (afterwards renamed *Ferrex and Porrex*) of T. Sackville, Lord Buckhurst, with whom T. Norton was joint author (1562). Though, unlike *Gorboduc*, classical in theme, and in some respects approaching nearer to the true conception of tragedy in their treatment of dramatic passion, the nearly contemporary *Apus and Virginia* (c. 1563) and Preston's *Cambises King of Persia*, in the roughness of their form more closely resemble the old religious drama; of other tragedies on classical subjects we have only the names, except in the instance of Gascoigne's *Jocasta*, a free version of the *Phœnix* of Euripides (1566), and of R. Edwards's *Damon and Pythias* (printed 1571), which calls itself a comedy, and is in fact a mixture of both species. Simultaneously with the influence, directly or indirectly exercised, of classical literature, that of Italian, both dramatic and narrative, asserted itself; early works from this source were the first *Romeo and Juliet* (not preserved, but apparently anterior in date even to *Gorboduc*), *Tancred and Gismunda* (1563?), and G. Whetstone's *Promos and Cassandra* (printed 1578), from which Shakespeare took the story of *Measure for Measure*.

Chronicle
histories.

From the double danger which threatened our tragic drama in the days of its infancy—that it would congeal on the cold heights of classical themes, or dissolve its vigour in the glowing heat of a passion fiercer than that of the Italians (*Inglese Italianato è un diavolo incarnato*)—it was preserved, more than by any other cause, by its happy association with the traditions of the national history. The crude growth of the chronicle history proved strong enough to assert itself by the side of tragedy based on classical and Italian models; and in a series of works of more or less uncertain dates, a vein was worked from which Shakespeare was to draw the richest ore. Among these rude compositions, which intermixed the blank verse introduced by *Gorboduc* with prose, and freely mingled comic with tragic elements—works half-epic, half-dramatic, and popular in form as they were national in theme,—are the *Famous Victories of Henry V.*, acted before 1588, *The Troublesome Raigne of King John* (printed 1591), and the *True Chronicle History of King Leir* (acted 1593). A still further step in advance was taken in what really deserves the title of the *Tragedy of Sir Thomas More* (c. 1590), not so much on account of the relative nearness of the subject to the time of its treatment, as because of the tragic responsibility of character here already clearly worked out.

Earliest
comedies.

Such had been the beginnings of tragedy in England up to the time when the genius of dramatists worthy to be called the predecessors of Shakespeare, under the influence of a creative literary epoch, seized the form ready to their hands. The birth of comedy, at all times a process of less labour, had slightly preceded that of tragedy in the history of our drama. Isolated Latin comedies had been produced in the original or in English versions or reproductions as early as the reign of Henry VIII., and the morality and its descendant, the interlude, pointed the way towards nationalizing and popularizing types equally fitted to divert Roman and Italian and English audiences. Thus the earliest extant English comedy, N. Udall's *Ralph Roister Doister*, which cannot be dated later than 1551, may be

described as a genuinely English adaptation of Plautus, while its successor, *Gammer Gurton's Needle*, printed 1575, and probably written by (Bishop) Still, has an original, and in consequence a slighter, though by no means unamusing, plot. In the main, however, our early English comedy, while occasionally introducing characters of genuinely native origin, and appealing to the traditional humours of Will Summer, the court-fool of Henry VIII.,² or Grim, the collier of Croydon,³ was content to borrow its themes from Italian or classical sources; Ariosto's *I Suppositi* found a translator in Gascoigne⁴ (1566), and the *Menæchmi* of Plautus translators or imitators in writers of rather later dates.⁵ While on the one hand the mixture of tragic with comic motives was already leading in the direction of tragi-comedy, the precedent of the Italian pastoral drama encouraged the introduction of figures and stories from classical mythology; and the rapid and versatile influence of Italian comedy seemed likely to continue to control the progress of the lighter branch of the English drama.

Out of such promises as these the glories of our drama were ripened by the warmth and light of the great Elizabethan age—of which the beginnings may fairly be reckoned from the third decennium of the reign to which it owes its name. The queen's steady love of dramatic entertainments could not of itself have led, though it undoubtedly contributed, to such a result. Against the attacks which a nascent puritanism was already directing against the stage by the hands of Northbrooke, the repentant playwright Gosson, Stubbes, and others, were to be set not only the barren favour of royalty, and the more direct patronage of great nobles, but the fact that literary authorities were already weighing the endeavours of the English drama in the balance of respectful criticism, and that in the abstract at least the claims of both tragedy and comedy were upheld by those who shrunk from the desipience of idle pastimes. As the popularity of the stage increased, the functions of playwright and actor, whether combined or not, began to hold out a reasonable promise of personal gain. Nor, above all, was that higher impulse, which leads men of talent and genius to attempt forms of art in harmony with the tastes and tendencies of their times, wanting to the group of writers who can be remembered by no nobler name than that of Shakespeare's predecessors.

The lives of all of these are, of course, in part contemporary with the life of Shakespeare himself; nor was there any substantial difference in the circumstances under which most of them, and he, led their lives as dramatic authors. A distinction was manifestly kept up between poets and playwrights. Of the contempt entertained for the actor's profession some fell to the share of the dramatist; "even Lodge," says Dr Ingleby, "who had indeed never trod the stage, but had written several plays, and had no reason to be ashamed of his antecedents, speaks of the vocation of the play-maker as sharing the odium attaching to the actor." Among the dramatists themselves good fellowship and literary partnership only at times asserted themselves as stronger than the tendency to mutual jealousy and abuse; of all chapters of dramatic history, the annals of the early Elizabethan stage perhaps least resemble those of Arcadia.

Moreover, the theatre had hardly found its strength as a powerful element in the national life, when it was involved in a bitter controversy, with which it had originally no connection, on behalf of an ally whose sympathy with it can only have been of a very limited

² *Missogonus*. ³ *The History of the Collier*. ⁴ *The Suppositi*.⁵ *A History of Error* (1), 1577; *The Menæchmi* taken out of Plautus (pr. 1595).¹ *Thæcæia*.

kind. The Marprelate controversy in 1589 led to a stoppage of stage plays which proved only temporary; but the general result of the attempt to make the stage a vehicle of political abuse and invective was beyond a doubt to coarsen and degrade both plays and players. The true remedy was at last applied, when from about the year 1594 the chief London actors became divided into two great rival companies—the Lord Chamberlain's and the Lord Admiral's—which alone received licences. Instead of half-a-dozen or more companies whose jealousies communicated themselves to the playwrights belonging to them, there were now, besides the Children of the Chapel, two established bodies of actors, directed by steady and, in the full sense of the word, respectable men. To the Lord Chamberlain's Company, which, after being settled at "the Theater," moved to the Globe on the Bankside in 1599, Shakespeare and Richard Burbadge, the greatest of the Elizabethan actors, belonged; the Lord Admiral's was managed by Philip Henslowe, the author of the *Diary*, and Edward Alleyn, the founder of Dulwich College, and was ultimately, in 1600, settled at the Fortune. In these and other houses were performed the plays of our Elizabethan dramatists, with few adventitious aids, the performance being crowded into a brief afternoon, when it is obvious that only the idler sections of the population could attend. No woman might appear at a playhouse unless masked; on the stage, down to the Restoration, women's parts continued to be acted by boys.

It is futile to take no account of such outward circumstances as these and many which cannot here be noted in surveying the progress of the literature of the Elizabethan drama. No dramatic literature which has any claim to rank beside it—not that of Athens nor those of modern Italy and Spain, nor those of France and Germany in their classic periods—had to contend against such odds; a mighty inherent strength alone ensured to it the vitality which it so triumphantly asserted, and which enabled it to run so unequalled a course.

Among Shakespeare's predecessors John Lyly (1554–1606), whose plays were all written for the Children of the Chapel and the Children of St Paul's, holds a position apart in our dramatic literature. The euphuism, to which his famous romance gave its name, likewise distinguishes his mythological,¹ quasi-historical,² allegorical,³ and satirical⁴ comedies. But his real service to the progress of our drama is to be sought neither in his choice of subjects nor in his imagery—though to his fondness for fairylore and for the whole phantasmagoria of legend, classical as well as romantic, his contemporaries, and Shakespeare in particular, were indebted for a stimulative precedent. It lies in his adoption of Gascoigne's innovation of writing plays in prose; and in his having, though under the fetters of an affected and vicious style, given the first example of brisk and vivacious dialogue—an example to which even such successors as Shakespeare and Jonson were indebted. Thomas Kyd (d. c. 1594), the author of the *Spanish Tragedy*, possesses some of the characteristics, but none of the genius, of the greatest tragic dramatist who preceded Shakespeare. No slighter tribute than this is assuredly the due of Christopher Marlowe (1564–1593), whose violent end prematurely closed a poetic career of dazzling brilliancy. His earliest play, *Tamburlaine the Great*, in which the use of blank verse was introduced upon the English public stage, while full of the "high astounding terms" of an extravagant and often bombastic diction, is already marked by the passion which was this poet's most characteristic feature, and which was to find ex-

pression so luxuriant in his *Doctor Faustus* and so surpassingly violent in his *Jew of Malta*. His master-piece, *Edward II.*, is a tragedy of singular pathos and of a dramatic power unapproached by any of his contemporaries. George Peele (1552–1596–7) was a far more versatile Peele-writer even as a dramatist; but though his plays contain passages of exquisite beauty, not one of them is worthy to be ranked by the side of Marlowe's *Edward II.*, compared with which, if indeed not absolutely, Peele's *Chronicle of Edward I.* still stands on the level of the species to which its title and character alike assign it. His finest play is undoubtedly *David and Bethsabe*, which resembles *Edward I.* in construction, but far surpasses it in beauty of language and versification, besides treating its subject with greatly superior dignity. If the difference between Peele and Shakespeare is still in many respects besides that of genius an immeasurable one, we seem to come into something like a Shakespearian atmosphere in more than one passage of the plays of the unfortunate Robert Greene (1561–1592), Greene's unfortunate perhaps in nothing more enduringly than in his notorious enmity to Shakespeare himself. His genius, which shone most brightly in plays treating English life and scenes, was in the main free from the pedantry which occasionally besets the flight of Peele's and even of Marlowe's muse; and his most delightful work⁵ at all events seems to breathe something of that indescribable freshness which we recognize, if not as a peculiarly Shakespearian characteristic, at least as one belonging to none but a truly national art. Thomas Lodge (c. 1558–1625), Thomas Nash the redoubtable pamphleteer (c. 1565–c. 1602), Henry Chettle (1564–c. 1667), who worked the chords of both pity⁶ and terror⁷ with equal vigour, and Anthony Munday (1553–1633), better remembered for his city pageants than for his plays, are among the other more generally known writers of the early Elizabethan drama, though not all of them can strictly speaking be called predecessors of Shakespeare.

The common characteristics of nearly all these dramatists were in accordance with those of the great age to which they belonged. Stirring times called for stirring themes, such as those of "Mahomet, Scipio, and Tamerlane;" and these again for a corresponding vigour of treatment. Neatness and symmetry of construction were neglected for fulness and variety of matter. Novelty and grandeur of subject seemed well matched by a swelling amplitude and often reckless extravagance of diction. As if from an inner necessity, the balance of rhymed couplets gave way to the impetuous march of blank-verse; "strong lines" were as inevitably called for as strong situations and strong characters. Distinct as the chief of these poets are from one another by the marks impressed upon both form and matter by individual genius, yet the stamp of the age is upon them all. Writing for the stage only, of which some of them possessed a personal experience, they acquired an instinctive insight into the laws of dramatic cause and effect, and infused a warm vitality into the dramatic literature which they produced, so to speak, for immediate consumption. On the other hand, the same cause made rapidity of workmanship indispensable to a successful playwright. How a play was produced, how many hands had been at work upon it, what loans and what spoliations had been made in the process, were considerations of less moment than the question whether it was produced, and whether it succeeded. His harness—frequently double or triple—was inseparable from the lusty Pegasus of the early English drama, and its genius toiled, to borrow the phrase of the Attic comedian, "like an Arcadian mercenary."

Earliest
tragedies.

ship, and Italian examples helped to commend Seneca, the most modern of the ancient tragedians, as a favourite author for such exercises. With the year of Elizabeth's accession began a series of translations of his plays by Jasper Heywood (John Heywood's son) and others; and to the direct influence of one of Seneca's tragedies¹ is to be ascribed the composition of the first tragedy proper in the English tongue, the *Gorboduc* (afterwards renamed *Ferrex and Porrex*) of T. Sackville, Lord Buckhurst, with whom T. Norton was joint author (1562). Though, unlike *Gorboduc*, classical in theme, and in some respects approaching nearer to the true conception of tragedy in their treatment of dramatic passion, the nearly contemporary *Apus and Virginia* (c. 1563) and Preston's *Cambises King of Persia*, in the roughness of their form more closely resemble the old religious drama; of other tragedies on classical subjects we have only the names, except in the instance of Gascoigne's *Jocasta*, a free version of the *Phœnisæ* of Euripides (1566), and of R. Edwards's *Damon and Pithias* (printed 1571), which calls itself a comedy, and is in fact a mixture of both species. Simultaneously with the influence, directly or indirectly exercised, of classical literature, that of Italian, both dramatic and narrative, asserted itself; early works from this source were the first *Romeo and Juliet* (not preserved, but apparently anterior in date even to *Gorboduc*), *Tancred and Gismunda* (1563?), and G. Whetstone's *Promos and Cassandra* (printed 1578), from which Shakespeare took the story of *Measure for Measure*.

Chronicle
histories

From the double danger which threatened our tragic drama in the days of its infancy—that it would congeal on the cold heights of classical themes, or dissolve its vigour in the glowing heat of a passion fiercer than that of the Italians (*Inglese Italianato è un diavolo incarnato*)—it was preserved, more than by any other cause, by its happy association with the traditions of the national history. The crude growth of the chronicle history proved strong enough to assert itself by the side of tragedy based on classical and Italian models; and in a series of works of more or less uncertain dates, a vein was worked from which Shakespeare was to draw the richest ore. Among these rude compositions, which intermixed the blank verse introduced by *Gorboduc* with prose, and freely mingled comic with tragic elements—works half-epic, half-dramatic, and popular in form as they were national in theme—are the *Famous Victories of Henry V.*, acted before 1588, *The Troublesome Raigne of King John* (printed 1591), and the *True Chronicle History of King Leir* (acted 1593). A still further step in advance was taken in what really deserves the title of the *Tragedy of Sir Thomas More* (c. 1590), not so much on account of the relative nearness of the subject to the time of its treatment, as because of the tragic responsibility of character here already clearly worked out.

Earliest
comedies

Such had been the beginnings of tragedy in England up to the time when the genius of dramatists worthy to be called the predecessors of Shakespeare, under the influence of a creative literary epoch, seized the form ready to their hands. The birth of comedy, at all times a process of less labour, had slightly preceded that of tragedy in the history of our drama. Isolated Latin comedies had been produced in the original or in English versions or reproductions as early as the reign of Henry VIII., and the morality and its descendant, the interlude, pointed the way towards nationalizing and popularizing types equally fitted to divert Roman and Italian and English audiences. Thus the earliest extant English comedy, N. Udall's *Ralph Roister Doister*, which cannot be dated later than 1551, may be

described as a genuinely English adaptation of Plautus, while its successor, *Gammer Gurton's Needle*, printed 1575, and probably written by (Bishop) Still, has an original, and in consequence a slighter, though by no means unamusing, plot. In the main, however, our early English comedy, while occasionally introducing characters of genuinely native origin, and appealing to the traditional humours of Will Sumner, the court-fool of Henry VIII.,² or Grim, the collier of Croydon,³ was content to borrow its themes from Italian or classical sources; Ariosto's *I Suppositi* found a translator in Gascoigne⁴ (1566), and the *Menæchmi* of Plautus translators or imitators in writers of rather later dates.⁵ While on the one hand the mixture of tragic with comic motives was already leading in the direction of tragi-comedy, the precedent of the Italian pastoral drama encouraged the introduction of figures and stories from classical mythology; and the rapid and versatile influence of Italian comed seemed likely to continue to control the progress of the lighter branch of the English drama.

Out of such promises as these the glories of our drama Conditions were ripened by the warmth and light of the great of the Elizabethan age—of which the beginnings may fairly be reckoned from the third decennium of the reign to which it owes its name. The queen's steady love of dramatic entertainments could not of itself have led, though it undoubtedly contributed, to such a result. Against the attacks which a nascent puritanism was already directing against the stage by the hands of Northbrooke, the repentant playwright Gosson, Stubbes, and others, were to be set not only the barren favour of royalty, and the more direct patronage of great nobles, but the fact that literary authorities were already weighing the endeavours of the English drama in the balance of respectful criticism, and that in the abstract at least the claims of both tragedy and comedy were upheld by those who shrunk from the desipience of idle pastimes. As the popularity of the stage increased, the functions of playwright and actor, whether combined or not, began to hold out a reasonable promise of personal gain. Progress of
tragedy
and
comedy
before
Shake-
speare.

This period of our drama, though it is far from being one of crude effort, could not therefore yet be one of full consummation. In tragedy the advance which had been made in the choice of great themes, in knitting closer the connection between the theatre and the national history, in vindicating to passion its right to adequate expression, was already enormous. In comedy the advance had been less decisive and less independent; much had been gained in reaching greater freedom of form and something in enlarging the range of subjects; but artificiality had proved a snare in the one direction, while the licence of the comic stage, upheld by favourite "clowns," such as Kemp or Tarleton, had not succumbed before more exacting demands. The way of escaping the dilemma had, however, been already recognized to lie in the construction of suitable plots, for which a full storehouse was open in the popular traditions preserved in national ballads, and in the growing literature of translated foreign fiction, or of native imitations of it. Meanwhile, the aberration of the comic stage to political and religious controversy, which it could never hope to treat with real freedom in a country provided with a strong monarchy and a dogmatic religion, seemed likely to extinguish the promise of the beginnings of English romantic comedy.

Shake-
speare.

These were the circumstances under which the greatest of dramatists began to devote his genius to the theatre. Shakespeare's career as a writer of plays can have differed little in its beginnings from those of his contemporaries and rivals. Before or while he was proceeding from the re-touching and re-writing of the plays of others to original dramatic composition, the most gifted of those we have termed his predecessors had passed away. He had been deemed as an actor before he was known as an author; and after living through days of darkness for the theatre, if not for himself, attained, before the close of the century, to the beginnings of his prosperity and the beginnings of his fame. But if we call him fortunate, it is not because of such rewards as these. As a poet Shakespeare was no doubt happy in his times, which intensified the national character, expanded the national mind, and were able to add their stimulus even to such a creative power as his. He was happy in the antecedents of the form of literature which commended itself to his choice, and in the opportunities which it offered in so many directions for an advance to heights yet undiscovered and unknown. What he actually accomplished was due to his genius, whose achievements are immeasurable like itself. His influence upon the progress of our national drama divides itself in very unequal proportions into a direct and an indirect one. To the former alone reference can here be made.

Shake-
speare
and the
national
historical
drama.

Already the first editors of Shakespeare's works in a collected form recognized so marked a distinction between his plays taken from English history and those treating other historical subjects (whether ancient or modern) that, while they included the latter among the tragedies at large, they grouped the former as *histories* by themselves. These *histories* are in their literary genesis a development of the *chronicle histories* of Shakespeare's predecessors and contemporaries, the taste for which had greatly increased towards the beginning of his own career as a dramatist, under influences naturally connecting themselves with the general current of national life and sentiment in this epoch. Though it cannot be assumed that Shakespeare composed his several dramas from English history in the sequence of the chronology of their themes, his genius gave to the entire series an inner harmony which has not unnaturally inspire commentators with the wish to prove it a symmetrically constructed whole. He thus brought this peculiarly national species to a perfection which made it difficult, if not impossible, for his later contemporaries and successors

to add to it more than an occasional supplement. None of them was found able or ready to take up the thread where Shakespeare had left it, after perfunctorily attaching the present to the past by a work (probably not all his own) which must be regarded as the end rather than the crown of the series of his *histories*.¹ But to furnish such supplements accorded little with the tastes and tendencies of the later Elizabethans, and with the exception of an isolated work,² the national historical drama in Shakespeare reached at once its perfection and its close. The older form of the old chronicle history for a time survived the advance made upon it, but the efforts in this field of T. Heywood,³ S. Rowley,⁴ and others are, from a literary point of view, anachronisms.

Of Shakespeare's other plays the several groups exercised a more direct influence upon the general progress of our dramatic literature. His Roman tragedies, though following their authorities with much the same fidelity as that of the English *histories*, even more effectively taught the great lesson of free dramatic treatment of historic themes, and thus pre-eminently became the perennial models of the modern historic drama. His tragedies on other themes, which necessarily admitted of a more absolute freedom of treatment, established themselves as the examples for all time of the highest kind of tragedy. Where else is exhibited with the same fulness the struggle between will and obstacle, character and circumstance? Where is mirrored with equal power and variety the working of those passions in the mastery of which over man lies his doom? Here, above all, Shakespeare as compared with his predecessors, as well as with his successors, "is that nature which they paint and draw." He threw open to modern tragedy a range of hitherto unknown breadth and depth and height, and emancipated the national drama in its noblest forms from limits to which it could never again restrict itself without a consciousness of having renounced its enfranchisement. Happily for the variety of his creative genius on the English stage, no divorce had been proclaimed between the serious and the comic, and no division of species had been established such as he himself ridicules as pedantic when it professes to be exhaustive. The comedies of Shakespeare accordingly refuse to be tabulated in deference to any method of classification deserving to be called precise, and several of them are comedies only according to a purely technical use of the term. In those in which the comic interest asserts itself to the instinct of reader or spectator as supreme, it is still of its nature incidental to the progress of the action, for it seems a just criticism (and one agreeing with what we can conclude as to Shakespeare's process of construction) that of all his comedies but one⁵ is in both design and effect a comedy of character proper. Thus in this direction, while the unparalleled wealth of his invention renewed or created a whole gallery of types, he left much to be done by his successors; while the truest secrets of his comic art, which interweaves fancy with observation, draws wisdom from the lips of fools, and imbues with character what all other hands would have left shadowy, monstrous, or trivial, are among the things inimitable belonging to the individuality of his poetic genius.

The influences of Shakespeare's diction and versification upon those of the English drama in general can hardly be over-rated, though it would be next to impossible to state them definitely. In these points, Shakespeare's manner as a writer was progressive; and this progress has been deemed sufficiently well traceable in his plays to be used as an aid in seeking to determine their chronological sequence. general laws of this progress accord with those of the natural advance of creative genius ; artificiality gives way to freedom, and freedom in its turn submits to a greater degree of regularity and care. In versification as in diction the earliest and the latest period of Shakespeare's dramatic writing are more easily recognizable than what lies between and may be called the normal period, the plays belonging to which in form most resemble one another, and are least affected by distinguishable peculiarities—such as the rhymes and intentionally emphatic colouring of style which characterize the earliest, or the feminine endings of the lines and the more condensed manner of expression common to the latest plays. But such distinctions apart, there can be no doubt but that in verse and in prose alike, Shakespeare's style, so far as it admitted of reproduction, is itself to be regarded as the *norm* of that of the Elizabethan drama, that in it the prose form of English comedy possesses its first accepted model, and that in it the chosen metre of the English versified drama established itself as irremovable unless at the risk of an unnatural experiment.

Influence
of his
method of
construction.

It may seem paradoxical to assert that it is by their construction that Shakespeare's plays exerted the most palpable influence upon the English drama, as well as upon the modern drama of the Germanic nations in general, and upon such forms of the Romance drama as have been in more recent times based upon it. For it was not in construction that his greatest strength lay, or that the individuality of his genius could raise him above the conditions under which he worked in common with his immediate predecessors and contemporaries. Yet the fact that he reconciled these conditions with creations of matchless strength and of unequalled fidelity to the demands of nature and art, established them as the conditions of what a popular (and consequently often abused) term has instinctively come to designate as the Shakespearian drama. The great and irresistible demand on the part of Shakespeare's public was for incident—a demand which of itself necessitated a method of construction different from that of the Greek drama, or of those modelled more or less closely upon it. To no other reason is to be ascribed the circumstance that Shakespeare so constantly combined two actions in the course of a single play, not merely supplementing the one by means of the other as a by or under-plot. In no respect is the progress of his technical skill as a dramatist more apparent,—an assertion which a comparison of plays clearly ascribable to successive periods of his life would satisfactorily establish.

His characters.

Should it, however, be sought to express in one word the greatest debt of the drama to Shakespeare, this word must be the same as that which expresses his supreme gift as a dramatist. It is in *characterization*—in the drawing of characters ranging through almost every type of humanity which furnishes a fit subject for the tragic or the comic art—that he remains absolutely unapproached ; and it was in this direction that he pointed the way which the English drama could not henceforth desert without becoming untrue to itself. It may have been a mere error of judgment which afterwards held him to have been surpassed by others in particular fields of characterization (which, forsooth, regarded him as supremely excellent in male but not in female characters). But it was a sure sign of decay when our writers began to shrink from following him in the endeavour to make the drama a mirror of humanity, and when, in self-condemned arrogance, they thrust unreality back upon a stage which he had animated with the warm breath of life, where Juliet had blossomed like a flower of spring, and where Othello's noble nature had suffered and sinned.

By the numerous body of poets who, contemporary with Shakespeare or in the next generation, cultivated the wide

field of the national drama, every form commending itself to the tastes and sympathies of the national genius was essayed. None were neglected except those from which the spirit of English literature had been estranged by the Reformation, and those which had from the first been artificial importations of the Renaissance. The mystery could not here, as in Spain, produce such an aftergrowth as the *auto*, and the confines of the religious drama were only now and then tentatively touched.¹ The direct imitations of the classical drama were few and feeble ; Chapman, while affecting some of its usages, made no serious attempt to reproduce its essentials ; experiments like W. Alexander's (afterwards Earl of Stirling) *Monarchlike Tragedies*² (1603–1605) are the mere isolated efforts of a student, like Milton's *Samson Agonistes* at a later date (1677). At the opposite end of the dramatic scale, the light gaiety of the Italian and French force could not establish itself on the English popular stage without more solid adjuncts ; the Englishman's festive digestion is robust, and he likes his amusements substantial. In the pastoral drama and the mask, however, many of our dramatists found special opportunities for the exercise of their lyrical gifts and of their inventive powers. The former could never become other than an exotic, so long as it retained the artificial character of its origin. Shakespeare had accordingly only blended elements derived from it into the action of his romantic comedies. In more or less isolated works Jonson, Fletcher, Daniel, Randolph, and others sought to rival Tasso and Guarini,—Jonson³ coming nearest to nationalizing an essentially foreign growth by the fresh simplicity of his treatment, Fletcher⁴ bearing away the palm for beauty of poetic execution. The mask was a more elastic kind of composition, mixing in varying proportions its constituent elements of declamation and dialogue, music and dancing, decoration and scenery. In its least elaborate literary form—which, of course, externally was the most elaborate—it closely approached the pageant ; in other instances the distinctness of its characters or the fullness of the action introduced into its scheme, brought it nearer to the regular drama. A frequent ornament of Queen Elizabeth's progresses, it was cultivated with increased assiduity in the reign of James I., and in that of his successor outshone, by the favour it enjoyed with court and nobility, the attractions of the regular drama itself. Most of the later Elizabethan dramatists contributed to this species, upon which Shakespeare only incidentally in the course of his dramas expended the resources of his fancy ; but by far the most successful writer of masks was Ben Jonson, of whose numerous compositions of this kind many hold a permanent place in our poetic literature, and “next” whom, in his own judgment, “only Fletcher and Chapman could write a mask.” From a poetic point of view, however, they were at least rivalled by Dekker and Ford, in productivity and favour. T. Campion (d. 1623) seems for a time to have excelled. Inasmuch, however, as the history of the mask in England is to a great extent that of “painting and carpentry” and of Inigo Jones, it need not here be further pursued. The *Microcosmus* of T. Nabbes (printed 1637), which is very like a morality, seems to have been the first mask brought upon the public stage. It was the performance of a mask by Queen Henrietta Maria and her ladies at Whitehall which had some years previously (1632) been thought to have supplied to the invective of *Histrion Mastix* against the stage the occasion for disloyal innuendo ; and it was for the performance of a mask in a great nobleman's castle that a very different Puritan had not long afterwards

(1634) composed one of the loftiest and loveliest of English poems. *Comus* has been judged and condemned as a drama,—unjustly, for the dramatic qualities of a mask are not essential to the species. Nor need its history in England have here been referred to, were it not so inseparably connected with that of the Elizabethan drama. In later times the mask merged into the opera, or continued a humble life of its own apart from contact with higher literary effort. It is strange that our later poets should have done so little to restore to its nobler uses, and to invest with a new significance, a form of so proved a flexibility as the poetic mask.

The later
Eliza-
bethan
drama.

The annals of our drama proper in the period reaching from the closing years of Elizabeth to the outbreak of the great Revolution include, together with numerous names relatively insignificant, many illustrious in the history of our poetic literature. Among Shakespeare's contemporaries and successors there is, however, but one who by the energy of his genius, not less than by the circumstances of his literary career, stands in a position of undisputed primacy among his fellows. Ben Jonson (1573-1635), to whom in his latter days a whole generation of younger writers did homage as to their veteran chief, was alone in full truth the founder of a school or family of dramatists. Yet his pre-eminence did not (whatever he or his followers may have thought) extend to both branches of the regular drama. In tragedy he fell short of the highest success; the weight of his learning lay too heavily upon his efforts to draw from deeper sources than those which had sufficed for Shakespeare. Such as they are, his tragic works¹ stand almost, though not quite, alone in this period as examples of sustained effort in historic tragedy proper. G. Chapman (1557 or 1559-1634) treated stirring themes, more especially from modern French history,² always with vigour, and at times with genuine effectiveness; but though rich in beauties of detail, he failed in this branch of the drama to follow Shakespeare even at a distance in the supreme art of fully developing a character by means of the action. Mention has already been made of Ford's isolated effort in the direction of historic tragedy and of those excursions into the still popular domain of the chronicle history by T. Heywood, Dekker, and others, which are to be regarded as nothing more than retrogressions. With the great body of the English dramatists of this and of the next period, tragedy had passed into a phase where its interest depended mainly upon plot and incident. The romantic tragedies and tragi-comedies which fill our literature in this period constitute together a growth of at first sight astonishing exuberance, and in mere externals of theme—ranging from Byzantium to ancient Britain, and from the Cæsars of ancient Rome to the tyrants of the Renaissance—of equally astonishing variety. The sources from which these subjects were derived had been constantly on the increase. Besides Italian, Spanish, and French fiction, original or translated, besides British legend in its Romance dress, and English fiction in its humbler or in its more ambitious and artificial forms, the contemporary foreign drama, especially the Spanish, offered opportunities for resort. To the English, as to the French and Italian drama, of both this and the following century, the prolific dramatists clustered round Lope de Vega and Calderon supplied a whole arsenal of plots, incidents, and situations—among others to Middleton, to Webster, and most signally to Beaumont and Fletcher. And in addition to these materials, a new field of resources was at hand since our dramatists had begun to regard events and episodes of English domestic life as fit subjects for tragic treatment.

¹ *Scævus his Fall, Catiline his Conspiracy*

² *Bussy d'Ambois, The Reveng of B. d'A.; The Conspiracy of Byron; The Tragedy of E. Chabot, Admiral of France (with Shirley)*

Domestic tragedy of this description was indeed no novelty on the English stage; Shakespeare himself may have touched, with his master-hand, more than one effort of this kind;³ but T. Heywood (c. 1570-c. 1605) may be regarded as the first who achieved any work of considerable literary value of this class,⁴ to which some of the plays of T. Dekker (c. 1570-c. 1640), T. Middleton, and others likewise more or less belong. Yet in contrast to this wide variety of sources, and consequent apparent variety of themes, the number of *motives* employed—at least as a rule—in the tragic drama of this period was comparatively small and limited. Hence it is that, notwithstanding the diversity of subjects among the tragic dramas of such writers as Marston, Webster, Fletcher, Ford, and Shirley, an impression of sameness is left upon us by a connected perusal of these works. Politic ambition, conjugal jealousy, absolute female devotion, unbridled masculine passion, such are the motives which constantly recur in the Decameron of our later Elizabethan drama. And this impression is heightened by the want of moderation, by the excess of passion, which these dramatists so habitually exhibit in the treatment of their favourite themes. All the tragic poets of this period are not equally amenable to this charge; in J. Webster⁵ (d. c. 1650), master as he is of the effects of the horrible, and in J. Ford⁶ (1586-c. 1640), surpassingly seductive in his sweetness, the monotony of exaggerated passion is broken by those marvellously sudden and subtle touches through which their tragic genius creates its most thrilling effects. Nor will the tendency to excess of passion which F. Beaumont (1586-1616) and J. Fletcher (1576-1625) undoubtedly exhibit be confounded with their distinctive power of sustaining tenderly pathetic characters and situations in a degree unequalled by any of their contemporaries—a power seconded by a beauty of diction and softness of versification which for a time raised them to the highest pinnacle of popularity, and which entitles them in their conjunction, and Fletcher as an independent worker, to an enduring pre-eminence among their fellows. In their morals Beaumont and Fletcher are not above the level of their age. The manliness of sentiment which ennobles the rhetorical genius of P. Massinger (1581-1640), and the gift of poetic illustration which entitles J. Shirley (1595-1666) to be remembered as something besides the latest and the most fertile of this group of dramatists, have less direct bearing upon the general character of the tragic art of the period. The common features of the romantic tragedy of this age are sufficiently marked, but not capable of obscuring the distinctive features in its individual writers which it is the highest function of criticism to discover and establish.

In comedy, on the other hand, the genius and the insight of Jonson pointed the way to a steady and legitimate advance. His theory of "humours" (which found the most palpable expression in two of his earliest plays⁷), if translated into the ordinary language of dramatic art, signifies the paramount importance in the comic drama of the creation of distinctive human types. In the actual creation of these it was impossible that Jonson should excel Shakespeare; but in the consciousness with which he recognized and indicated the highest sphere of a comic dramatist's labours, he rendered to the drama a direct service which Shakespeare had left unperformed. By the rest of his contemporaries and his successors, some of whom (such as Brome) were content proudly to follow in his footsteps, Jonson was only occasionally rivalled in individual

instances of comic creations; in the entirety of its achievements his genius as a comic dramatist remained unapproached. The favourite types of Jonsonian comedy, to which Dekker, J. Marston (1575-1624), and Chapman had, though to no large extent, added others of their own, were elaborated with incessant zeal and remarkable effect by their contemporaries and successors. It was after a very different fashion from that in which the Roman comedians reiterated the ordinary types of the New Attic comedy, that the inexhaustible *verve* of T. Middleton (1574-1624), the buoyant productivity of Fletcher, the observant humour of N. Field (c. 1590-c. 1640), and the artistic versatility of Shirley—not to mention many later and lesser names—mirrored in innumerable pictures of contemporary life the undying follies and foibles of mankind. As comedians of manners more than one of these surpassed the old master, not indeed in distinctness and correctness,—the fruits of the most painstaking genius that ever fitted a learned sock to the living realities of life,—but in a lightness which did not impair their sureness of touch; while in the construction of plots the access of abundant new materials, and the greater elasticity in treatment which is the result of accumulated experience, enabled them to maintain a steady progress. Thus our comic dramatic literature from Jonson to Shirley is unsurpassed as a comedy of manners, while as a comedy of character it at least defies comparison with any other national literary growth preceding or contemporaneous with it. Though the younger generation, of which W. Cartwright (1611 or 1615-1643) may be taken as an example, was unequal in originality or force to its predecessors, yet so little exhausted was the vitality of the species, that its traditions survived the *interregnum* of the Revolution, and connected themselves in some measure with later growths of English comedy.

The later
Eliza-
bethan
stage

The rivals against which in its closing period the old English drama had to contend have been already noticed. From the masks and triumphs at court and at the houses of the nobility, with their Olympuses and Parnassuses built by Inigo Jones, and filled with goddesses and nymphs clad in the gorgeous costumes designed by his inventive hand, to the city pageants and shows by land and water,—from the tilts and tournaments at Whitehall to the more philosophical devices at the Inns of Court and the academical plays at the universities,—down even to the brief but thrilling theatrical excitements of Bartholomew Fair and the “Ninevitical motions” of the puppets,—in all these ways the various sections of the theatrical public were tempted aside. Foreign performers—French and Spanish actors, and even French actresses—paid visits to London. But the national drama held its ground. The art of acting maintained itself at least on the level to which it had been brought by Shakespeare’s associates and contemporaries, Burbadge and Heminge, Alleyn, Lewin, Taylor, and others “of the older sort.” The profession of actor came to be more generally than of old separated from that of playwright, though they were still (as in the case of Field) occasionally combined. But this rather led to an increased appreciation of artistic merit in actors who valued the dignity of their own profession and whose co-operation the authors learnt to esteem as of independent significance. The stage was purged from the barbarism of the old school of clowns. Women’s parts were still acted by boys, many of whom attained to considerable celebrity; and a practice was thus continued which placed the English theatre at a considerable disadvantage as compared with the Spanish (where it never obtained), and which probably to some extent reacted upon the licence of expression assumed by our dramatists. The arrangement of the stage, which facilitated a rapid succession of scenes without any necessity for their being organically connected with one another, re-

mained essentially the same as in Shakespeare’s days, though the primitive expedients for indicating locality had begun to be occasionally exchanged for scenery more or less appropriate to the place of action. Costume was apparently cultivated with much greater care; and there is no reason to suppose that the English stage of this period had not gone as far as was expedient in a direction in which in feebler times so vast an amount of effort has come to be spent. The drama still depended in the main upon its literary essentials and upon the actor’s art; but the system of prologues and epilogues, and of dedications to published plays, was more uniformly employed than it had been by Shakespeare as the conventional method of recommending authors and actors to the favour of individual patrons, and to that of their chief patron, the public.

Up to the outbreak of the Civil War the drama in all its forms continued to enjoy the favour or good-will of the court, although a close supervision was exercised over all attempts to make the stage the vehicle of political references or allusions. The regular official agent of this supervision was the Master of the Revels, but under James I. a special ordinance, in harmony with the king’s ideas concerning the dignity of the throne, was passed “against representing any modern Christian king in plays on the stage.” The theatre could hardly expect to be allowed a liberty of speech in reference to matters of state denied to the public at large; and occasional attempts to indulge in the freedom of criticism dear to the spirit of comedy met with more or less decisive repression and punishment.¹ But the sympathies of the dramatists were so entirely on the side of the court, that the real difficulties against which the theatre had to contend came from a directly opposite quarter. With the growth of Puritanism the feeling of hostility to the stage increased in a large part of the population, well represented by the civic authorities of the capital. This hostility found many ways of expressing itself. The attempts to suppress the Blackfriars theatre (1619, 1631, 1633) proved abortive; but the representation of stage plays continued to be prohibited on Sundays, and during the prevalence of the plague in London in 1637 was temporarily suspended altogether. The desire of the Puritans of the more pronounced type openly aimed at a permanent closing of the theatres. The war between them and the dramatists was accordingly of a life-and-death kind. On the one hand, the drama heaped its bitterest and often coarsest attacks upon whatever savoured of the Puritan spirit; gibes, taunts, caricatures in ridicule and aspersion of Puritans and Puritanism make up a great part of the comic literature of the later Elizabethan drama and of its aftergrowth in the reigns of the first two Stuarts. This feeling of hostility, to which Shakespeare was no stranger,² though he cannot be connected with the authorship of one of its earliest and coarsest expressions,³ rose into a spirit of open defiance in some of the masterpieces of Ben Jonson;⁴ and the comedies of his contemporaries and successors⁵ abound in caricatured reproductions of the more common or more extravagant types of Puritan life. On the other hand, the moral defects, the looseness of tone, the mockery of ties sanctioned by law and consecrated by religion, the tendency to treat middle-class life as the hunting-ground for the amusements of the upper classes, which degraded so much of the dramatic literature

The drama
and Puritanism.

of the age, intensified the Puritan opposition to all and any stage plays. A patient endeavour to reform instead of suppressing the drama was not to be looked for from such adversaries, should they ever possess the means of carrying out their views; and so soon as Puritanism should victoriously assert itself in the state, the stage was doomed. Among the attacks directed against it in its careless heyday of prosperity Prynne's *Histrio Mastix* (1632), while it involved its author in shamefully cruel persecution, did not remain wholly without effect upon the tone of the dramatic literature of the subsequent period; but the quarrel between Puritanism and the theatre was too old and too deep to end in any but one way, so soon as the latter was deprived of its protectors. The Civil War began in August 1642; and early in the following month was published the Ordinance of the Lords and Commons, which, after a brief and solemn preamble, commanded "that while these sad causes and set-times of humiliation do continue, public stage plays shall cease and be forborne." Many actors and playwrights followed the fortunes of the royal cause in the field; some may have gone into a more or less voluntary exile; upon those who lingered on in the familiar haunts the hand of power lay heavy; and though there seems reason to believe that dramatic entertainments of one kind or another continued to be occasionally presented, stringent ordinances gave summary powers to magistrates against any players found engaged in such proceedings (1647), and bade them treat all stage-players as rogues, and pull down all stage galleries, seats, and boxes (1648). A few dramatic works were published in this period; while at fairs about the country were acted farces called "drolls," consisting of the most vulgar scenes to be found in popular plays. Thus, the life of the drama was not absolutely extinguished; and its darkest day proved briefer than perhaps either its friends or its foes could have supposed.

Closing
of the
theatres.

Revival of
the drama.

Already "in Oliver's time" private performances took place from time to time at noblemen's houses and (though not undisturbed) in the old haunt of the drama, the Red Bull. In 1656 the ingenuity of Sir William Davenant (1606-1669), whose name, though not otherwise eminent in our dramatic literature, is memorable as connecting together two distinct periods in it, ventured on a bolder step in the production of a quasi-dramatic entertainment "of declamation and music;" and in the following year he brought out with scenery and music a piece which was afterwards in an enlarged form acted and printed as the first part of his opera, *The Siege of Rhodes*. This entertainment he afterwards removed from the private house where it had been produced to the Cockpit, where he soon ventured upon the performance of regular plays written by himself. Thus, under the cover of two sister arts, whose aid was in the sequel to prove by no means altogether beneficial to its progress, the English drama had boldly anticipated the Restoration, and was no longer hiding its head when that much desired event was actually brought about. Soon after Charles II.'s entry into London, two theatrical companies are known to have been acting in the capital. For these companies patents were soon granted, under the names of "the Duke (of York's) and "the King's Servants," to Davenant and one of the brothers Killigrew respectively,—the former from 1662 acting at Lincoln's Inn Fields, then at Dorset Garden in Salisbury Court, the latter from 1663 at the Theatre Royal near Drury Lane. These companies were united from 1682, a royal licence being granted in 1695 to a rival company which performed in Lincoln's Inn Fields, and which migrated to Covent Garden in 1733. Meanwhile Vanbrugh had in 1705 built the theatre in the Haymarket; and a theatre in Goodman's Fields—afterwards rendered

famous by the first appearance of Garrick—led a fitful existence from 1729 to 1733. The Act of 1737 deprived the Crown of the power of licensing any more theatres; so that the history of the English stage for a long period was confined to a limited area. The rule which prevailed after the Restoration, that neither of the rival companies should ever attempt a play produced by the other, operated beneficially both upon the activity of dramatic authorship and upon the progress of the art of acting, which was not exposed to the full effects of that deplorable spirit of personal rivalry which leads actors, in order to outshine their fellows, to attempt parts for which they often have no special qualification. There can be little doubt that the actor's art has rarely flourished more in England than in the days of T. Betterton (1635-1710) and his contemporaries, among whose names those of Hart, Mohun, Kynaston, Nokes, Mrs Barry, Mrs Betterton, Mrs Braecgirdle, and Mrs Eleanor Gwynne have, together with many others, survived in various connections among the memories of the Restoration age. No higher praise has ever been given to an actor than that which Addison bestowed upon Betterton, in describing his performance of *Othello* as a proof that Shakespeare could not have written the most striking passages of the character otherwise than he has done.

It may here be noticed, that the fortunes of the Irish The Irish theatre in general followed those of the English, of which stage of course it was merely a branch. Of native dramatic compositions in earlier times not a trace remains in Ireland; and the drama was introduced into that country as an English exotic—apparently already in the reign of Henry VIII., and more largely in that of Elizabeth. The first theatre in Dublin was built in 1635; but in 1641 it was closed, and even after the Restoration the Irish stage continued in a precarious condition till near the end of the century.

Already in the period preceding the outbreak of the civil war the English drama had perceptibly sunk from the height to which it had been raised by the great Elizabethans. When it had once more recovered possession of that arena with which no living drama can dispense, it would have been futile to demand that the dramatists should return altogether into the ancient paths, unaffected by the influences, native or foreign, in operation around them. But there was no reason why the new drama should not, like the Elizabethan, be true in spirit to the higher purposes of the dramatic art, to the nobler tendencies of the national life, and to the eternal demands of moral law. Because the later Stuart drama was as a whole untrue to these, and, while following its own courses, never more than partially returned from the aberrations to which it condemned itself, its history is that of a decay which the indisputable brilliancy, borrowed or original, of many of its productions is incapable of concealing.

Owing in part to the influence of the French theatre, Tragedy which by this time had taken the place of the Spanish as the ruling drama of Europe, the separation between tragedy and comedy is clearly marked in our post-Restoration plays. Comic scenes are still occasionally introduced into tragedies by some of our dramatists who adhered more closely to the Elizabethan models (such as Otway and Crowne), but the practice fell into disuse; while the endeavour to elevate comedy by pathetic scenes and motives is one of the characteristic marks of the beginning of another period in our dramatic literature. The successive phases through which English tragedy passed in the later Stuart times cannot be always kept distinct from one another; and the guidance offered by the theories put forth by some of the dramatists in support of their practice is often delusive. Following the example of Corneille, Dryden and his contemporaries

The later
Stuart
drama.

and successors were fond of proclaiming their adherence to this or that principle of dramatic construction or form, and of upholding, with much show of dialectical acumen, maxims derived by them from French or other sources, or elaborated with modifications and variations of their own, but usually amounting to little more than what Scott calls "certain romantic whimsical imitations of the dramatic art." The student of the drama will find much both to entertain and to instruct him in these prefaces, apologies, dialogues, and treatises; he will acknowledge that Dryden's incomparable vigour does not desert him either in the exposing or in the upholding of fallacies; and that even Rymer,¹ usually regarded as having touched the nadir of dramatic criticism, is not wholly without grains of salt. But Restoration tragedy itself must not be studied by the light of Restoration criticism. So long as any dramatic power remained in our tragic poets—and it is absent from none of the chief among them from Dryden to Rowe—the struggle between fashion (disguised as theory) and instinct (tending in the direction of the Elizabethan traditions) could never wholly determine itself in favour of the former.

Lord Orrery (1621–1679), in deference, as he declares, to the expressed tastes of his sovereign King Charles II. himself, was the first to set up the standard of *heroic plays*. This new species of tragedy (for such it professed to be) commended itself by its novel choice of themes, to a large extent supplied by recent French romance—the *romans de longue haleine* of the Scudérys and their contemporaries—and by French plays treating similar themes. It likewise borrowed from France that garb of rhyme which the English drama had so long abandoned, and which now reappeared in the heroic couplet. But the themes which to readers of novels might seem of their nature inexhaustible could not long suffice to satisfy the more capricious appetite of theatrical audiences; and the form, in the application it was sought to enforce for it, was doomed to remain an exotic. In conjunction with his brother-in-law Sir R. Howard (1626–1698),² and afterwards more confidently by himself,³ Dryden (1631–1699) threw the incomparable vigour and brilliancy of his genius into the scale, which soon rose to the full height of fashionable popularity. At first he claimed for English tragedy the right to combine her native inheritance of freedom with these valuable foreign acquisitions.⁴ Nor was he dismayed by the ridicule which the celebrated burlesque (by the duke of Buckingham and others) of *The Rehearsal* (1671) cast upon heroic plays, without discriminating between them and such other materials for ridicule as the contemporary drama supplied to its facetious authors, but returned to the defence of a species⁵ which he was himself in the end to abandon. The desire for change proved stronger than the love of consistency—which in Dryden was never more than theoretical. After summoning tragedy to rival the freedom (without disdaining the machinery) of opera, he came to recognize in characterization the truest secret of the master-spirit of the Elizabethan drama,⁶ and, after audaciously but not altogether unhappily essaying to rival Shakespeare on his own ground,⁷ produced under the influence of the same views at least one work of striking merit.⁸ But he was already growing weary of the stage itself as well as of the rhymed heroic drama; and though he put an end to the species to which he had given temporary vitality, he failed effectively to point the way to a more legitimate development of English tragedy. Among the

other tragic poets of this period, N. Lee (1650–1690), in the outward form of his dramas, accommodated his practice to that of Dryden, with whom he occasionally co-operated as a dramatist, and like whom he allowed political partisanship to intrude upon the stage. His rhetorical genius was not devoid of genuine energy, nor is he to be regarded as a mere imitator. T. Otway (1651–1695), the most gifted tragic poet of the younger generation contemporary with Dryden, inherited something of the spirit of the Elizabethan drama; he possessed a real gift of tragic pathos and of expressive tenderness; but his genius had an alloy of impurity, and though he was often happy in his novel choice of themes, his efforts were as incomplete as his end was premature. T. Southerne (1660–1746) was likewise possessed of pathetic power; but his success was primarily due to his skill in the choice of "sensational" plots,⁹ J. Crowne (d. c. 1703), Lord Lansdowne ("Granville the polite") (c. 1667–1735), Congreve, by virtue of a single long celebrated but not really remarkable tragedy,¹⁰ and N. Rowe (1673–1718) may be further singled out from the list of the tragic dramatists of this period, many of whom were, like their comic contemporaries, mere translators or adapters from the French. The tragedies of Rowe, whose direct services to the study of Shakespeare are not to be forgotten, indicate with singular distinctness the transition from the fuller declamatory style of Dryden to the calmer and thinner manner of Addison. In tragedy (as to a more marked degree in comedy) the excesses (both of style and subject) of the past period of the English drama had produced an inevitable reaction; decorum was asserting its claims on the stage as in society; and French tragedy had set the example of sacrificing what passion—and what vigour—it retained in favour of qualities more acceptable to the "reformed" court of Louis XIV. Addison (1672–1719), in allowing his *Cato* to take its chance upon the stage, when a moment of political excitement (April 1713) ensured it an extraordinary success, to which no feature in it corresponds, except an unusual number of lines predestined to become familiar quotations, sealed the doom of English national tragedy. The "first reasonable English tragedy," as Voltaire called it, had been produced, and the oscillations of the tragic drama of the Restoration were at an end.

English comedy in this period displayed no similar desire to cut itself off from the native soil, though it freely borrowed the materials for its plots and many of its figures from Spanish, and afterwards more generally from French, originals. The spirit of the old romantic comedy had long since fled; the graceful artificialities of the pastoral drama, even the light texture of the mask, ill suited the demands of an age which made no secret to itself of the grossness of its sensuality. With a few unimportant exceptions, such poetic elements as admitted of being combined with the poetic drama were absorbed by the opera and the ballet. No new species of the comic drama formed itself, though towards the close of the period may be noticed the beginnings of modern English farce. Political and religious partisanship, generally in accordance with the dominant reaction against Puritanism, were allowed to find expression in the directest and coarsest forms upon the stage, and to hasten the necessity for a more systematic control than even the times before the Revolution had found requisite. At the same time the unblushing indecency which the Restoration had spread through court and capital had established its dominion over the comic stage, corrupting the manners, and with them the morals, of its dramatists, and forbidding them, at the risk of seeming

dull, to be anything but improper. Much of this found its way even into the epilogues, which, together with the prologues, proved so important an adjunct of the Restoration drama. These influences determine the general character of what is with a more than chronological meaning termed the comedy of the Restoration. In construction, the national love of fulness and solidity of dramatic treatment induced its authors to alter what they borrowed from foreign sources, adding to complicated Spanish plots characters of native English directness, and supplementing single French plots by the addition of others. At the same time the higher efforts of French comedy of character, as well as the refinement of expression in the list of their models, notably in Molière, were alike seasoned to suit the coarser appetites and grosser palates of English patrons. The English comic writers often succeeded in strengthening the borrowed texture of their plays, but they never added comic humour without at the same time adding coarseness of their own. Such were the productions of Sir George Etherege (c. 1636–c. 1694), Sir Charles Sedley (c. 1639–c. 1728), and the other “gentlemen who wrote at ease;” nor was there any signal difference between their productions and those of a playwright-actor, such as J. Lacy (d. 1681), and a professional dramatist of undoubted ability, such as J. Crowne. Such, though often displaying the brilliancy of a genius which even where it sank could never wholly abandon its prerogative, were, it must be confessed, the comedies of Dryden himself. On the other hand, the lowest literary depths of the Restoration drama were sounded by T. D’Urfey (1630–1723), while of its moral degradation the “divino Astruc,” the “unspeakable” Mrs Aphra Behn (1642–1689) has an indefeasible title to be considered the most faithful representative. T. Shadwell (1640–1692), fated like the tragic poet Elkanah Settle (1648–1724), to be chiefly remembered as a victim of Dryden’s satire, deserves more honourable mention. Like J. Wilson (d. 1690), whose plays seem to class him with the pre-Restoration dramatists, Shadwell had caught something not only of the art, but also of the spirit, of Ben Jonson, but in most of his works he was, like the rest of his earlier contemporaries, and like the brilliant group which succeeded them, content to take his moral tone from the reckless society for which, or in deference to the tastes of which, he wrote. The absence of a moral sense, which, together with a grossness of expression often defying exaggeration, characterizes our comic dramatists from the days of Dryden to those of Congreve, is the main cause of their failure to satisfy the demands which are legitimately to be made upon their art. They essayed to draw character as well as to paint manners, but they rarely proved equal to the former and higher task; and while choosing the means which most readily commended their plays to the favour of their immediate public, they achieved but little as interpreters of those essential distinctions which their art is capable of illustrating. Within these limits, though occasionally passing beyond them, and always with the same deference to the immoral tone which seemed to have become an indispensable adjunct of the comic style, even the greatest comic authors of this age moved. W. Wycherley (1640–1715) was a comic dramatist of real power, who drew his characters with vigour and distinctness, and constructed his plots and chose his language with natural ease. He lacks gaiety of spirit, and his wit is of a cynical turn. But while he ruthlessly uncloaks the vices of his age, his own moral tone is affected by their influence in as marked a degree as that of the most light-hearted of his contemporaries. The most brilliant of these was indisputably W. Congreve (1672–1728), who is not only one of the very wittiest of English writers, but equally excels

in the graceful ease of his dialogue, and draws his characters and constructs his plots with the same masterly skill. His chief fault as a dramatist is one of excess—the brilliancy of the dialogue, whoever be the speaker, overpowers the distinction between the “humours” of his personages. Though he is less brutal in expression than “manly” Wycherley, and less coarse than the lively Sir J. Vanbrugh (c. 1666–1726), licentiousness in him as in them corrupts the spirit of his comic art; but of his best though not most successful play¹ it must be allowed that the issue of the main plot is on the side of virtue. G. Farquhar (1678–1707), whose morality is on a par with that of the other members of this group, is inferior to them in brilliancy; but as pictures of manners in a wider sphere of life than that which contemporary comedy usually chose to illustrate, two of his plays deserve to be noticed, in which we already seem to be entering the atmosphere of the 18th century novel².

The improvement which now begins to manifest itself in the moral tone and spirit of English comedy is partly due to the reaction against the reaction of the Restoration, partly to the punishment which the excesses of the comic stage had brought upon it in the invective of Jeremy Collier³ (1698), of all the assaults the theatre in England has had to undergo the best founded, and that which produced the most perceptible results. The comic poets, who had always been more or less conscious of their sins, and had at all events not defended them by the ingenious sophistries which it has pleased later literary criticism to suggest on their behalf, now began with uneasy merriment to allude in their prologues to the reformation which had come over the spirit of the town. Writers like Mrs Centlivre (c. 1678–1722) became anxious to reclaim their offenders with much emphasis in the fifth act; and Colley Cibber (1671–1757)—whose *Apology for his Life* furnishes a useful view of this and the subsequent period of the history of the stage, with which he was connected as author, manager, and actor (excelling in this capacity as representative of those fools with which he peopled the comic stage⁴)—may be credited with the moral intention he claims to have kept in view throughout his career as a dramatist. Sir R. Steele (1671–1729), in accordance with his general tendencies as a writer, pursued a still more definite moral purpose in his comedies; but his genius perhaps lacked the sustained vigour necessary for a dramatist, and his humour naturally sought the aid of pathos. Accordingly, taking a hint from Colley Cibber, who so well understood the public taste, Steele, passing from partial⁵ to more complete⁶ experiment, became the founder of that *sentimental comedy* which exercised so depressing an influence upon the progress of our drama. Thus the two writers whose associated efforts so largely contributed to open a new and productive vein in our literature, both signally helped to hasten the decline of its dramatic branch. With *Cato* English tragedy committed suicide, though its pale ghost survived; with *The Conscious Lovers* English comedy sank into the tearful embrace of artificiality and weakness, from which it has never again altogether torn itself away.

It seems superfluous within the limits of a summary like the present to attempt to classify with any degree of minuteness the remaining phenomena in the history of our dramatic literature. During the 18th century its productions were still as a rule legitimately designed to meet the demands of the stage, from which its higher efforts after-

Garrick.

wards to so large an extent became dissociated. But the demands of the stage and those of its patrons and of the public of the "Augustan" age, and of that which succeeded it, in general were fast bound by the trammels of a taste with which a revival of the poetic drama remained irreconcilable during a long period of our literature. There is every reason to conclude that the art of acting progressed in the same direction of artificiality, and stiffened into apparently immutable forms in such actors as Macklin and Quin. The genius of Garrick, whose theatrical career extended from 1741 to 1776, opened a new era in his art. His unparalleled success was due in the first instance to his incomparable natural gifts; but these were indisputably enhanced by a careful and continued literary training, and ennobled by a purpose which prompted him to essay the noblest, as he was capable of performing the most various, range of English theatrical characters. By devoting himself as actor and manager with special zeal to the production of Shakespeare, Garrick permanently popularized on the national stage the greatest creations of our drama, and indirectly helped to seal the doom of the surviving tendency to maintain in the most ambitious walks of our dramatic literature the nerveless traditions of the pseudo-classical school. A generation of celebrated actors and actresses, many of whom live for us in the drastic epigrams of Churchill's *Rosciad* (1761), were his helpmates or his rivals; but their fame has paled, while his is destined to endure as that of one of the typical masters of his art.

Decline of tragedy.

The contrast between the tragedy of the 18th century and those plays of Shakespeare and one or two other Elizabethans which already before Garrick were known to the English stage, was indeed weakened by the mutilated form in which these generally, if not always, made their appearance there. Even so, however, there are perhaps few instances in theatrical history in which so strange a competition was so long sustained. In the hands of the tragic poets of the age of Pope, as well as of that of Johnson, tragedy had hopelessly stiffened into the forms of its accepted French models. Direct reproductions of these continued, as in the case of Ambrose Philips's (c. 1671-1749) and Charles Johnson's (1679-1748) translations from Racine, and Aaron Hill's (1685-1750) from Voltaire. Among other tragic dramatists of the earlier part of the century may be mentioned J. Hughes (1677-1720), who, after assisting Addison in his *Cato*, produced at least one praiseworthy tragedy of his own;¹ E. Fenton (1683-1730), a joint translator of "Pope's *Homer*" and the author of one extremely successful drama;² and L. Theobald (d. 1744), the first hero of the *Dunciad*, who, besides translations of Greek dramas, produced a few more or less original plays, one of which he was daring enough to father upon Shakespeare.³ A more distinguished name is that of J. Thomson (1700-1748), whose unlucky *Sophonisba* and subsequent tragedies are, however, barely remembered by the side of his poems. The literary genius of E. Young (1681-1765), on the other hand, possessed vigour and variety enough to distinguish his tragedies from the ordinary level of Augustan plays; in one of them he seems to challenge comparison in the treatment of his theme with a very different rival,⁴ but by his main characteristics as a dramatist he belongs to the school of his contemporaries. The endeavours of G. Lillo (1693-1739) to bring the lessons of tragedy home to his fellow-citizens were destined to exercise a powerful influence upon the early progress of the German drama, and not to remain without significance for the history of our own; but his pedestrian muse failed in the end to satisfy higher artistic demands than those met in his most popular

play,⁵ and broke down in the attempt to carry the terrors of *Macbeth* into the regions of domestic tragedy.⁶ "Classical" tragedy in the generation of Johnson pursued the even tenor of its way, the dictator himself treading with solemn footfall in the accustomed path,⁷ and Mason (1725-1797) making the futile attempt to produce a close imitation of Greek models. The best-remembered tragedy of the century, Home's *Douglas* (1757), was the production of an author whose famous kinsman, David Hume, had advised him "to read Shakespeare, but to get Racine and Voltaire by heart." The indisputable merits of the play cannot blind us to the fact that *Douglas* is the child of *Merope*.

While thus no high creative talent arose to revive the English poetic genius of English tragedy, comedy, which had to contend against the same rivals, naturally met the demands of the conflict with greater buoyancy. The history of the most formidable of those rivals forms no part of this sketch (see Musio); but the points of contact between its progress and the history of our dramatic literature cannot be altogether left out of sight. H. Purcell's (1658-1695) endeavours to unite English music to the words of English poets were now a thing of the past; the isolated efforts of Addison⁸ and others to recover the operatic stage for the native tongue had proved powerless. Italian texts, which had first made their entrance piecemeal, in the end asserted themselves in their entirety; and the German genius of Handel completed the triumphs of a form of art which no longer had any connection with the English drama, and which reached the height of its fashionable popularity about the time when Garrick began to adorn the national stage. In one form, however, the English opera was preserved as a pleasing species of the popular drama. The pastoral drama had (in 1725) produced an isolated aftergrowth in Allan Ramsay's *Gentle Shepherd*, which, with genuine freshness and humour, but without a trace of burlesque, transferred to the scenery of the Pentland Hills the lovely tale of Florizel and Perdita. The dramatic form of this poem is only an accident, but it doubtless suggested an experiment of a different kind to the most playful of London wits. Gay's "Newgate Pastoral" of *The Beggar's Opera* (1728), in which the amusing text of a burlesque farce was interspersed with songs set to popular airs, caught the fancy of the town by this novel combination, and became the ancestor of a series of agreeable productions, none of which, however, have ever rivalled it in celebrity. Among these the pieces of J. Bickerstaff⁹ (c. 1735-c. 1788) and of C. Dibdin¹⁰ (1745-1814) may be signalized. The opera in England as elsewhere thus absorbed what vitality remained to the pastoral drama, while to the ballet and the pantomime (whose glories in England began at Covent Garden in 1733, and to whose popularity even Garrick was obliged to defer) was left (in the 18th century at all events) the inheritance of the external attractions of the mask and the pageant.

In the face of such various rivalries it is not strange that comedy, instead of adhering to the narrow path which Steele and others had marked out for her, should have permitted herself some vagaries of her own. Gay's example pointed the way to a fatally facile form of the comic art, and burlesque began to contribute its influence to the decline of comedy. In an age when party-government was severely straining the capabilities of its system, dramatic satire had not far to look for a source of effective seasonings. The audacity of H. Fielding (1707-1754), whose regular comedies (original or adapted) have secured no enduring remembrance, but whose love of parody was

The Licensing Act

afterwards to suggest to him the theme of the first of the novels which have made his name immortal, accordingly ventured in two extravaganzas¹ (so we should call them in these days) upon a larger admixture of political with literary and other satire. A third attempt² (which never reached the stage) furnished the offended minister, Sir Robert Walpole, with the desired occasion for placing a curb upon the licence of the theatre, such as had already been advocated by a representative of its old civic adversaries. The famous Act of 1737 asserted no new principle, but converted into legal power the customary authority hitherto exercised by the Lord Chamberlain (to whom it had descended from the Master of the Revels). The regular censorship which this Act established has not appreciably affected the literary progress of the English drama, and the objections which have been raised against it seem on candid consideration untenable. The liberty of the stage is a question differing in its conditions from that of the liberty of speech in general, or even from that of the liberty of the press; and occasional lapses of official judgment weigh lightly in the balance against the obvious advantages of a system which in a free country needs only the vigilance of public opinion to prevent its abuse. The policy of the restraint which the Act of 1737 put upon the number of playhouses is a different, but has long become an obsolete, question.

Comedy in the latter half of the 18th century

Brought back into its accustomed grooves, English comedy seemed inclined to leave to farce the domain of healthy ridicule, and to coalesce with domestic tragedy in the attempt to make the stage a vehicle of home-spun didactic morality. Farce had now become a genuine English species, and has as such retained its vitality through all the subsequent fortunes of the stage; it was actively cultivated by Garrick as both actor and author, but the very best farce of this age is ascribed to clerical authorship³. S. Foote (1720-1761), whose comedies⁴ and farces are distinguished both by wit and by variety of characters (though it was an absurd misapplication of a great name to call him the English Aristophanes), introduced into comic acting the abuse of personal mimicry, for the exhibition of which he ingeniously invented a series of entertainments, the parents of a long progeny of imitations. Meanwhile the domestic drama of the sentimental kind had achieved its greatest success in *The Gamester* of E. Moore (d. 1757), and sentimental comedy courted sympathetic applause in the works of A. Murphy (1727-1801), the single comedy of W. Whitehead⁵ (1714-1785), and the earliest of H. Kelly⁶ (1714-1785). It cannot be said that this species was extinguished, as it is sometimes assumed to have been, by O. Goldsmith (1728-1774), but his admirable character-comedy of *The Good-Natured Man*, and his delightfully brisk and fresh *She Stoops to Conquer*, after startling critical propriety from its self-conceit, taught comedy no longer to fear being true to herself. The most successful efforts of the elder G. Colman (1733-1794)⁷ had in them something of the spirit of genuine comedy, besides a finish which, however playwrights may shut their eyes to the fact, is one of the qualities which ensure a long life to a play. And in the masterpieces of R. B. Sheridan (c. 1752-1816) some of the happiest features of the comedy of Congreve were revived, together with its too uniform brilliancy of dialogue, but without its indecency of tone. The varnish of the age is indeed upon the style, and the hollowness of its morality in much of the sentiment (even where that

sentiment is meant for the audience) of *The Rivals* and *The School for Scandal*; but in tact of construction, in distinctness of characters, and in pungency of social satire, they are to be ranked among the glories of English comedy. Something in Sheridan's style, but quite without his brilliancy, is the most successful play⁸ of the unfortunate General Burgoyne (d. 1792). R. Cumberland (1732-1811), who too consciously endeavoured to excel both in sentimental morality and in comic characterization, in which he was devoid of depth, closes the list of authors of higher pretensions who wrote for the theatre. Like him, Mrs. Cowley⁹ ("Anna Matilda") (1743-1809), T. Holcroft¹⁰ (1744-1809), and G. Colman the younger¹¹ (1762-1836), all writers of popular comedies, as well as the prolific J. O'Keefe (1746-1833), who contributed to nearly every species of the comic drama, survived into our century. To an earlier date belong the favourite burlesques of O'Keefe's countryman K. O'Hara¹² (d. 1782), good examples of a species the further history of which may be left aside. In the hands of at least one living writer, J. R. Planché, it has proved capable of satisfying a more refined taste than his successors have habitually consulted.

The decline of dramatic composition of the higher class, perceptible in the history of the English theatre about the beginning of the 19th century, is attributed by Scott to the wearing out of the French model that had been so long wrought upon; while, as he points out, the new impulse which was sought in the dramatic literature of Germany was derived from some of its worst, instead of from its noblest, productions—from Kotzebue rather than from Lessing, Schiller, and Goethe. But the change which was coming over English literature was in truth of a wider and deeper nature than it was possible for even one of its chief representatives to perceive. As that literature freed itself from the fetters so long worn by it as indispensable ornaments, and threw aside the veil which had so long obscured both the full glory of its past and the lofty capabilities of its future, it could not resort except tentatively to a form which like the dramatic is bound by a hundred bonds to the life of the age itself. Soon, the poems with which Scott and Byron, and the unrivalled prose fictions with which Scott both satisfied and stimulated the imaginative demands of the public, diverted the attention of the cultivated classes from dramatic literature, which was unable to escape, with the light foot of verse or prose fiction, into "the new, the romantic land." New themes, new ideas, new forms occupied a new generation of writers and readers; nor did the drama readily lend itself as a vessel into which to pour so many fermenting elements. In Byron (1788-1824) the impressions produced upon a mind not less open to impulses from without than subjective in its way of recasting them, called forth a series of dramatic attempts betraying a more or less wilful ignorance of the demands of dramatic compositions; his beautiful *Manfred*, partly suggested by Goethe's *Faust*, and his powerful *Cain*, have but the form of plays; his tragedies on Italian historical subjects show some resemblance in their political rhetoric to the contemporary works of Alfieri; his *Werner* is a hastily-dramatized sensation novel. To Coleridge (1772-1834), who gave to English literature a fine though inaccurate translation of Schiller's *Wallenstein*, the same poet's *Robbers* (to which Wordsworth's only dramatic attempt, the *Borderers*, is likewise indebted) had probably suggested the subject of his tragedy of *Osorio*, afterwards acted under the title of *Remorse*. superior to this is his later drama of *Zapolya*, a genuine homage to Shakespeare, out of the themes of two of whose plays it is gracefully woven. Scott, who in his earlier days had translated Goethe's *Götz von Berlichingen*, gained no reputation by his own dramatic compositions. W. S. Landor (1775-1864), apart from those *Imaginary Conversations* upon which he best loved to expend powers of observation and characterization such as have been given to few dramatists, cast in a formally dramatic mould studies of character of which the value is far from being confined to their wealth in beauties of detail. Of these the magnificent, but in construction altogether undramatic, *Count Julian* is the most noteworthy. Shelley's (1792-1822) *The Cenci*, on the other hand, is not only a poem of great beauty, but a drama of true power, abnormally revolting in its theme, but singularly pure and delicate in treatment. A humbler niche in the temple of our dramatic literature belongs to some of the plays of C. R. Maturin¹ (1782-1824), Sir T. N. Talfourd² (1795-1854), and Dean Milman³ (1791-1868). Divorced, except for moments, from the stage, English dramatic literature in its higher forms can in the present century no longer be regarded as a connected national growth, though it would be rash to deny that with the isolated efforts of individual poets future developments may connect themselves. Among living poets Sir H. Taylor has perhaps approached nearest to the objective spirit and the fullness of style of the Elizabethan drama; R. H. Horne survives as a worthy representative of the modern Romantic school; Matthew Arnold has the dignity of form of his classic models, Longfellow the graceful facility of a mellow literary culture; while R. Browning's insight into the secrets of human character, and A. C. Swinburne's gift of passionate poetic speech, are true dramatic qualities. By his *Hannibal* J. Nichol has likewise made a noteworthy contribution to the higher literature of our drama. The latest English dramatic poet is Tennyson, whose homage to the national form of the historic drama may be hopefully interpreted as a promise of the future possibly awaiting it. Far greater is the number of those English writers of the present century who, while seeking to preserve a connection between the demands of the stage and their dramatic productions, have addressed themselves to the theatrical rather than the literary public—since such a distinction must needs be drawn. The respect paid by her contemporaries to the modestly simple and judiciously concentrated efforts of Mrs Joanna Baillie (1762-1851) entitles her to remembrance in the annals of literature as well as those of the stage; but it would be going too far to make a similar exception in favour of the plays of Sheridan Knowles (1784-1862) or of the late Lord Lytton (1806-1873). At the present day the theatre commands the services of many authors of talent, a few of whose most successful productions may peradventure be destined to survive the age which gave birth to them. But here, if anywhere, the task of selection must be left to time.

The history of the English stage in the present century has been one of gradual decline and decay, not (especially at the present day) without prospects of recovery, of which a praiseworthy hopefulness is ever willing to make the most. At the beginning of the century the greatest tragic actress of the English theatre, Mrs Siddons, had passed her prime; and before its second decade had closed, not only she (1812), but her brother John Kemble (1817), the representative of a grand style of acting upon which the present generation would hardly dare to look, had withdrawn from the boards. Mrs Siddons was soon followed

into retirement by her successor Miss O'Neill (1819); while Kemble's brilliant later rival, Edmund Kean, an actor the intuitions of whose genius seem to have supplied, so far as intuition ever can supply, the absence of a steady self-culture, remained on the stage till his death in 1833. Young, Macready, and others handed down some of the traditions of the old school of acting to the very few who remain to suggest its semblance to the living generation. But even these—among whom a tribute of gratitude is specially due to Helen Faucit and S. Phelps—are now lost (or all but lost) as active members to the theatre, and they have left no school behind them. The comic stage has been fortunate in an ampler aftergrowth, from generation to generation, of the successors of the old actors who live for us in the reminiscences of Charles Lamb; nor are the links all snapped which bind the humours of the present to those of the past. It is least of all in any spirit of depreciation that the efforts of the actors of our day, in any branch of the art, should be discussed. But it is right to point out that these efforts are carried on under conditions of a partly novel character, to which the actors are forced to submit. No art stands in greater need of the help of training,—an advantage with which the modern English actor is virtually obliged to dispense. No art stands in greater need of the relief of change in the subjects of its exercise,—but the modern English actor is made to look forward, as to the height of success, to playing the same character for three hundred nights. No art stands in greater need of the guidance of criticism,—but the modern English actor is too often left to criticise himself. Finally, none stands in greater need of the protection of self-respect,—but there are few theatres in England which are not from time to time degraded in deference to tastes which in earlier days not Puritan censors only would have called by a simpler name.

The reaction against the theatre, which set in with the spread of the religious movement at the close of the last century, had the natural effect of lowering instead of raising its tone and manners, as well as those of the literature designed to supply its immediate demands. With the growth of that enlightenment which is inseparable from tolerance, this reaction seems to be giving place to a counter-reaction; while on the other hand, a larger section of the educated classes have begun to take an interest in the progress of the national drama, and the world of fashion is condescending to follow the impulse. Dramatic criticism, too—a branch of English literature to which from the days of Steele to those of Hazlitt so many writers of mark were ready to devote their efforts, but which had more recently often fallen into hands either unequal to the task or disdainful of it—seems here and there awakening to a sense of its higher duties. But all this will not permanently recover the stage for its higher tasks, or reunite to it a living dramatic literature, unless an object of serious moment for the future of the nation is pursued in a serious spirit, and unless it is thought worth while to devise means suited to this end. In a word, so long as there is no national theatre which, removed above the conditions of a commercial speculation, can cultivate the art to which it is dedicated for the sake of that art itself, the future of the English drama will be at the mercy of the likings of London, and of the adoption of those likings by the London which is not London, and by the "provinces," as in theatrical matters they are only too appropriately called. The time may come when it will be recognized that the progress and culture of a people depend upon its diversions as well as upon its occupations; and that the interests of a national art are not unworthy the solicitude of thoughtful statesmen.

¹ *Bertram*.² *Ion*.³ *Fazio*.

The history of the GERMAN drama differs widely from that of our own, though a close contact is observable between them at an early point, and again at relatively recent points, in their annals. The dramatic literature of Germany, though in its beginnings intimately connected with the great national movement of the Reformation, soon devoted its efforts to a sterile imitation of foreign models; while the popular stage, persistently suiting itself to a robust but gross taste, likewise largely due to the influence of foreign examples, seemed destined to a hopeless decay. The literary and the acted drama were thus estranged from one another during a period of extraordinary length, nor was it till the middle of the 18th century that, with the opening of a more hopeful era for the life and literature of the nation, the renaissance of dramatic literature and the stage began to accomplish itself. Before the end of the same century the progress of the German drama in its turn began to influence that of other nations, and by the widely comprehensive character of its literature, as well as by the activity of its stage, to invite a steadily increasing interest.

Towards the close of the Middle Ages, as has been seen, dramatic performances had in Germany as in England largely fallen into the hands of the civic guilds, and the composition of plays was more especially cultivated by the *master-singers* of Nuremberg and other towns. Thus, while the scholars of the German Renaissance, who so largely became the agents of the Reformation, eagerly dramatized, both in the Latin and the native tongue, the narratives of the Bible, and sought to suit the scholastic drama to the demands of the times (P. Rebhann,¹ a protégé of Luther, standing foremost among those religious dramatists), it was under the influence of the Reformation also, and of the impulse given by Luther and others to the use of High German as the popular literary tongue, that Hans Sachs, the immortal shoemaker of Nuremberg, seemed destined to become the father of the popular German drama. In his plays, "spiritual," secular, and *Fastnachtspiele* alike, the interest indeed lies in the dialogue rather than in the action, nor do they display any attempt at development of character. In their subjects, whether derived from Scripture, or from popular legend and fiction,² there is no novelty, and in their treatment no originality. But the healthy vigour and fresh humour of this marvellously fertile author, and his innate sympathy with the views and sentiments of the burgher class to which he belonged, were elements of genuine promise—a promise which the event was signally to disappoint. Though the manner of Hans Sachs found a few followers, and is recognizable in the German popular drama even of the beginning of the 17th century, the literature of the Reformation, of which his works may claim to form part, was soon absorbed in labours of a very different kind. The stage, after admitting novelties introduced from Italy or (under Jesuit supervision) from Spain, was subjected to another and enduring influence. Among the foreign actors of various nations who fitted through the innumerable courts of the empire, or found a temporary home there, special prominence was acquired, towards the close of the 16th and in the early years of the 17th century, by the "English comedians," who appeared at Cassel, Wolfenbüttel, Berlin, Dresden, Cologne, &c. Through these players a number of early English dramas found their way into Germany, where they were performed in more or less imperfect versions, and called forth imitations by native authors. Duke Henry Julius of Brunswick-Lüneburg³ (1564–1613)

and Jacob Ayrer (a citizen of Nuremberg, where he died, 1605) represent the endeavours of the early German drama to suit its still untried forms to themes suggested by English examples; and in their works, and in those of contemporary playwrights, reappears no small part of what we may conclude to have been the "English comedians' repertoire."⁴ (The converse influence of German themes brought home with them by the English actors, or set in motion by their strolling ubiquity, cannot have been equal in extent, though Shakespeare himself may have derived the idea of one of his plots⁵ from such a source.) But though welcome to both princes and people, the exertions of these foreign comedians, and of the native imitators who soon arose in the earliest professional companies of actors known in Germany, instead of bringing about a union between the stage and literature, led to a directly opposite result. The popularity of these strollers was owing partly to the (very real) blood and other horrors with which their performances were deluged, partly to the buffoonery with which they seasoned, and the various tricks and feats with which they diversified them. The representatives of the English clowns had learnt much on their way from their brethren in the Netherlands, where in this period the art of grotesque acting greatly flourished. Nor were the aids of other arts neglected,—to this day in Germany professors of the "equestrian drama" are known by the popular appellation of "English riders." From these true descendants of the mimes, then, the professional actors in Germany inherited a variety of tricks and traditions; and soon the favourite figures of the popular comic stage became conventional, and were stereotyped by the use of masks. Among these, an acknowledged supremacy was acquired by the native *Hans Wurst* (Jack Pudding)—of whose name Luther disavowed the invention, and who is known already to Hans Sachs—the privileged buffoon, and for a long series of generations the real lord and master, of the German stage. If that stage, with its grossness and ribaldry, seemed likely to become permanently estranged from the tastes and sympathies of the educated classes, the fault was by no means entirely its own and that of its patron the populace. The times were evil times for a national effort of any kind; and poetic literature was in all its branches passing into the hands of scholars who were often pedants, and whose language was a jargon of learned affectations. Thus things continued, till the awful visitation of the Thirty Years' War cast a general blight upon the nation, and the traditions of the popular theatre were left to the guardianship of the marionettes (*Puppenspiele*)!

When, in the midst of that war, German poets once more began to essay the dramatic form, the national drama was left outside their range of vision. M. Opitz (1597–1639), who holds an honoured place in the history of the German language and literature, in this branch of his labours contented himself with translations of classical dramas and of Italian pastorals—among the latter one of Rinuccini's *Daphne*, with which the history of the opera in Germany begins. A. Gryphius (1616–1664), though as a comic dramatist lacking neither vigour nor variety, and acquainted with Shakespearian⁶ as well as Latin and Italian examples, chiefly devoted himself to the imitation of Latin, earlier French, and Dutch tragedy, the rhetorical dialogue of which he effectively reproduced in the Alexandrine metre. Neither the turgid dramas of D. C. von Lohenstein (1665–1684), for whose *Cleopatra* the honour of having been the first German tragedy has been

recently claimed, nor even the healthier comedies of Chr. Weise (1642-1708) were brought upon the stage; while the religious plays of J. Klay (1616-1656) are mere recitations connected with the Italian growth of the *oratorio*. The frigid allegories commemorative of contemporary events, with which the learned from time to time supplied the theatre, and the pastoral dramas with which the idyllic poets of Nuremberg—"the shepherds of the Pegnitz"—after the close of the war gratified the peaceful longings of their fellow-citizens, were alike mere scholastic efforts. These indeed continued in the universities and *gymnasia* to keep alive the love of both dramatic composition and dramatic representation, and to encourage the theatrical taste which led so many students into the professional companies. But neither these dramatic exercises nor the *ludi Cæsarei* in which the Jesuits at Vienna revived the pomp and pageantry, and the mixture of classical and Christian symbolism, of the Italian Renaissance, had any influence upon the progress of the popular drama.

The stage
before its
reform.

The history of the German stage remains to about the second decennium of the 18th century one of the most melancholy, as it is in its way one of the most instructive, chapters of theatrical history. Ignored by the world of letters, the actors in return deliberately sought to emancipate their art from all dependence upon literary material. Improvisation reigned supreme, not only in farce, where *Hans Wurst*, with the aid of Italian examples, never ceased to charm his public, but in the serious drama likewise (in which, however, he also played his part) in those *Haupt- und Staatsactionen* (high-matter-of-state-dramas), the plots of which were taken from the old stores of the English comedians, from the religious drama and its sources, and from the profane history of all times. The hero of this period is "Magister" J. Velthen, who at the head of a company of players for a time entered the service of the Saxon court, and by producing comedies of Molière and other writers sought to restrain the licence which he had himself carried beyond all earlier precedent, but who had to fall back into the old ways and the old life. His career exhibits the climax of the efforts of the art of acting to stand alone; after his death (c. 1693) chaos ensues. The strolling companies, which now included actresses, continued to foster the popular love of the stage, and even under its most degraded form to uphold its national character against the rivalry of the opera, and that of the Italian *commedia dell'arte*. From the latter was borrowed Harlequin, with whom *Hans Wurst* was blended, and who became a standing figure in every kind of popular play. He established his rule more especially at Vienna, where from about 1712 the first permanent German theatre was maintained. But for the actors in general there was little permanence, and amidst miseries of all sorts, and under the growing ban of clerical intolerance, the popular stage seemed destined to hopeless decay.

F. C.
Neuber,
Gottsched,
and the
Leipsic
school.

The first endeavours to reform what had thus apparently passed beyond all reach of recovery were neither wholly nor generally successful; but this does not diminish the honour due to two names which should never be mentioned without respect in connection with the history of the drama. Friderica Caroline Neuber's (1690-1760) biography is the story of a long-continued effort which, notwithstanding errors and weaknesses, and though, so far as her personal fortunes were concerned, it ended in failure, may almost be described as heroic. As directress of a company of actors which from 1727 had its headquarters at Leipsic (hence the new school of acting is called the Leipsic school), she resolved to put an end to the formlessness of the existing stage, to separate tragedy and comedy, and to extinguish Harlequin. In this endeavour she was supported by the Leipsic professor J. Chr.

Gottsched (1672-1766), who induced her to establish French tragedy and comedy as the sole models of the regular drama. Literature and the stage thus for the first time joined hands, and no temporary mischance or personal misunderstanding can obscure the enduring significance of the union. Not only were the abuses of a century swept away from a representative theatre, but a large number of literary works, designed for the stage, were produced on it. It is true that they were but versions or imitations from the French (or in the case of Gottsched's *Dying Cato* from the French and English),¹ and that at the moment of the regeneration of the German drama new fetters were thus imposed upon it, and upon the art of acting at the same time. But the impulse had been given, and the beginning made. On the one hand men of letters began to subject their dramatic compositions to the test of performance, the tragedies and comedies of J. E. Schlegel (1718-1749), the artificial and sentimental comedies of Chr. F. Gellert (1715-1769) and others, together with the vigorous popular comedies of the Danish dramatist Holberg, were brought into competition with translations from the French. On the other hand, the Leipsic school exercised a continuous effect upon the progress of the art of acting, and before long the Garrick of Germany, C. Eckhof (1720-1778), began a career, outwardly far humbler than that of the great English actor, but which made his art a fit subject for the critical study of scholars, and his profession one for the equal esteem of honourable men.

Eckhof.

Among the authors contributing to Mme. Neuber's Leipsic enterprise had been a young student destined to complete, after a very different fashion and with very different aims, the work which she and Gottsched had begun. The critical genius of G. E. Lessing (1729-1781) is peerless in its comprehensiveness, as in its keenness and depth; but if there was any branch of literature and art which by study and practice he made pre-eminently his own, it was that of the drama. As bearing upon the progress of the German theatre, his services to its literature, both critical and creative, can only be described as inestimable. The *Hamburgische Dramaturgie*, a series of criticisms of plays and (in its earlier numbers) of actors, was undertaken in furtherance of the attempt to establish at Hamburg the first national German theatre (1767-9). This alone would invest these papers with a high significance; for though the theatrical enterprise proved abortive, yet it established the principle upon which the future of the theatre in all countries depends, that for the dramatic art the immediate theatrical public is no sufficient court of appeal. But the direct effect of the *Dramaturgie* was to complete the task Lessing had in previous writings begun, and to overthrow the dominion of the arbitrary French rules and the French models established by Gottsched. Lessing vindicated its real laws to the drama, made clear the difference between the Greeks and their would-be representatives, and established the claims of Shakespeare as the modern master of both tragedy and comedy. His own dramatic productivity was cautious, tentative, progressive. His first step was, by his *Miss Sara Sampson* (1755), to oppose the realism of the English domestic drama to the artificiality of the accepted French models, in the forms of which Chr. F. Weiss (1726-1804) was seeking to treat the subjects of Shakespearian plays.² Then, in his *Minna von Barnhelm* (1767) he essayed a national comedy drawn from real life, and appealing to patriotic sentiments as well as to broad human sympathies, written in prose (like *Miss Sara Sampson*), but in form holding a judicious mean between French and English examples.

The note sounded by the criticisms of Lessing met with a

Efforts of
the theatre
and of
literature.

ready response, and the productivity displayed by the nascent dramatic literature of Germany is astonishing both in the efforts inspired by his teachings and in those which continued to controvert, or which aspired to transcend them. On the stage, Harlequin and his surroundings proved by no means easy to suppress, more especially at Vienna, the chosen home of frivolous amusement; but even here a reform was gradually effected, and, under the intelligent rule of the emperor Joseph II., a national stage grew into being. The mantle of Eckhof fell upon the shoulders of his eager younger rival, F. L. Schrodor (1743-1816), who was the first to domesticate Shakespeare upon the German stage. In dramatic literature few of Lessing's earlier contemporaries produced any works of permanent value, unless the religious dramas of F. G. Klopstock (1724-1803)—a species in which he had been preceded by J. J. Bodmer (1698-1783)—and the patriotic *Bardietten* of the same author be excepted. S. Gessner (1730-1787), J. W. L. Gleim (1719-1803), and G. K. Pfeffel (1736-1809) composed pastoral plays. But a far more potent stimulus prompted the efforts of the younger generation. The translation of Shakespeare, begun in 1762 by C. M. Wieland (1733-1813), whose own plays possess no special significance, and completed in 1775 by Eschenburg, which furnished the text for many of Lessing's criticisms, helps to mark an epoch in German literature. Under the influence of Shakespeare, or of their conceptions of his genius, arose a youthful group of writers who, while worshipping their idol as the representative of nature, displayed but slight anxiety to harmonize their imitations of him with the demands of art. The notorious *Ugolino* of H. W. von Gerstenberg (1737-1823) seemed a premonitory sign that the coming flood might make a circular motion back to the extravagances and horrors of the old popular stage; and it was with a sense of this danger in prospect that Lessing in his third important drama, the prose tragedy *Emilia Galotti* (1772), set the example of a work of incomparable nicety in its adaptation of means to end. But successful as it proved, it could not stay the excesses of the *Sturm und Drang* period which now set in. Lessing's last drama, *Nathan the Wise* (1779), was not measured to the standard of the contemporary stage, but it was to exercise its influence in the progress of time,—not only through causing a reaction in tragedy from prose to blank verse (first essayed in Brawe's *Brutus*, 1770), but through ennobling and elevating by its moral and intellectual grandeur the branch of literature to which in form it belongs.

The
Sturm
und *Drang*

Meanwhile the young geniuses of the *Sturm und Drang* had gone forth, as worshippers rather than followers of Shakespeare, to conquer new worlds. The name of this group of writers, more remarkable for their collective significance than for their individual achievements, was derived from a drama by one of the most prolific of their number, M. F. von Klinger¹ (1752-1801); other members of the fraternity were J. A. Leisewitz² (1752-1806), M. R. Lenz³ (1750-1792), and F. Müller⁴ the "painter" (1750-1825). The youthful genius of the greatest of German poets was itself under the influences of this period, when it produced the first of its masterpieces. But Goethe's *Gotz von Berlichingen* (1773), both by the choice and treatment of its national theme, and by the incomparable freshness and originality of its style, holds a position of its own in German dramatic literature. Though its defiant irregularity of form prevented its complete success upon the stage, yet its influence is far from being represented by the series of mostly feeble imitations to which it gave rise. The *Ritterdramen* (plays of chivalry) had their day like similar fashions in drama or romance;

but the permanent effect of *Gotz* was to have crushed with an iron hand the last remnants of theatrical conventionality (those of costume and scenery included), and to have extinguished with them the lingering respect for rules and traditions of dramatic composition which even Lessing had treated with consideration. Its highest significance, however, lies in its having been the first great dramatic work of a great national poet, and having definitively associated the national drama with the poetic glories of the national literature.

Thus in the classical period of that literature, of which Goethe and Schiller were the ruling stars, the drama had a full share of the loftiest of its achievements. Of these, the dramatic works of Goethe vary so widely in form and character, and connect themselves so intimately with the different phases of the development of his own self determined poetic genius, that it was impossible for any of them to become the starting-points of any general growths in the history of the German drama. His way of composition was, moreover, so peculiar to himself—conception often preceding execution by many years, part being added to part under the influence of new sentiments and ideas and views of art, flexibly followed by changes of form—that the history of his dramas cannot be severed from his general poetic and personal biography. His *Clavigo* and *Stella*, which succeeded *Gotz*, are domestic dramas in prose; but neither by these, nor by the series of charming pastorals and operas which he composed for the Weimar court, could any influence be exercised upon the progress of the national drama. In the first conception of his *Faust*, he had indeed sought the suggestion of his theme partly in popular legend, partly in a domestic motive familiar to the authors of the *Sturm und Drang* (the story of Gretchen); the later additions to the *First Part*, and the *Second Part* generally, are the results of metaphysical and critical studies and meditations belonging to wholly different spheres of thought and experience. The dramatic unity of the whole is thus, at the most, external only; and the standard of judgment to be applied to this wondrous poem is not one of dramatic criticism. *Egmont*, originally designed as a companion to *Gotz*, was not completed till many years later; there are few dramas more effective in parts, but the idea of a historic play is lost in the elaboration of the most graceful of love episodes. In *Iphigenia* and *Tasso*, Goethe exhibited the perfection of form of which his classical period had enabled him to acquire the mastery; but the sphere of the action of the former (perfect though it is as a dramatic action), and the nature of that of the latter, are equally remote from the demands of the popular stage. Schiller's genius, unlike Goethe's, was naturally and consistently suited to the claims of the theatre. His juvenile works, *The Robbers*, *Fiesco*, *Kabale und Liebe* (*Intrigue and Love*), vibrating under the influence of an age of social revolution, mingled in their prose form the truthful expression of passion with no small element of extravagance. But with true insight into the demands of his art, and with unequalled single-mindedness and self-devotion to it, Schiller gradually emancipated himself from his earlier style; and with his earliest tragedy in verse, *Don Carlos*, the first period of his dramatic authorship ends, and the promise of the second announces itself. The works which belong to this—from the *Wallenstein* trilogy to *Tell*—are the acknowledged master-pieces of the German poetic drama, treating historic themes reconstructed by conscious dramatic workmanship, and clothing their dialogue in a noble vestment of rhetorical verse. In one of these, *The Bride of Messina*, Schiller attempted a new use of the chorus of Greek tragedy; but the endeavour was a splendid error, and destined to exercise no lasting effect. Schiller's later dramas gradually conquered the stage,

The
popular
stage

over which his juvenile works had triumphantly passed, but on which his *Don Carlos* had met with a cold welcome. For a long time, however, its favourites were authors of a very different order, who suited themselves to the demands of a public little concerned with the literary progress of the drama. After popular tastes had oscillated between the imitators of *Gotz* and those of *Emilia Galotti*, they entered into a more settled phase as the establishment of standing theatres at the courts and in the large towns increased the demand for good "acting" plays. Famous actors, such as Schröder and A. W. Iffland (1759-1814), sought by translations or compositions of their own to meet the popular likings, which largely took the direction of that irrepressible favourite of theatrical audiences, the sentimental domestic drama. But the most successful purveyor of such wares was an author who, though not himself an actor, understood the theatre with professional instinct,—A. von Kotzebue (1761-1819). His productivity ranged from the domestic drama and comedy of all kinds to attempts to rival Schiller and Shakespeare in verse; and though his popularity (which ultimately proved his doom) brought upon him the bitterest attacks of the Romantic school and other literary authorities, his self-conceit is not astonishing, and it seems time to say that there is some exaggeration in the contempt which has been lavished upon him by posterity. Nor should it be forgotten that German literature had hitherto failed to furnish the comic stage with any successors to *Minna von Barnhelm*, for Goethe's efforts to dramatize characteristic events or figures of the Revolutionary age¹ must be dismissed as failures, not from a theatrical point of view only. The joint efforts of Goethe and Schiller for the Weimar stage, important in many respects for the history of the German drama, at the same time reveal the want of a national dramatic literature sufficient to supply the needs of a theatre endeavouring to satisfy the demands of art.

The
romantic
school.

Meanwhile the so-called Romantic school of German literature was likewise beginning to extend its labours to original dramatic composition. From the universality of sympathies proclaimed by this school, to whose leaders Germany owed its classical translation of Shakespeare,² and an introduction to the dramatic literatures of so many ages and nations,³ a variety of new dramatic impulses might be expected; while much might be hoped for the future of the national drama (especially in its mixed and comic species) from the alliance between poetry and real life which they preached, and which some of them sought personally to exemplify. But in practice universality presented itself as peculiarity or even as eccentricity; and in the end the divorce between poetry and real life was announced as authoritatively as their union had been. Outside this school, the youthful talent of Th. Körner (1791-1813), whose early promise as a dramatist⁴ might perhaps have ripened into a fulness enabling him not unworthily to occupy the seat left vacant by his father's friend Schiller, was extinguished by a patriotic death. The efforts of M. von Colln (1776-1823) in the direction of the historical drama remained isolated attempts. But of the leaders of the Romantic school, A. W. (1767-1845)⁵ and F. von Schlegel⁶ (1772-1829), contented themselves with frigid classicalities; and L. Tieck (1772-1855), in the strange alembic of his *Phantasus*, melted legend and fairy-tale, novel and drama,⁷ poetry and satire, into a compound, enjoyable indeed, but hardly so in its entirety, or in many of its parts, to any but the literary mind. F. de la Motte-

Fonqué (1777-1843) infused a spirit of poetry into the chivalry drama. Clemens Brentano (1777-1842) was a Later fantastic dramatist unsuited to the stage. Here a feeble outgrowth of the romanticists, the "destiny dramatists" Z. Werner⁸ (1768-1823), A. Müllner⁹ (1774-1829), and C. E. v. Houwald¹⁰ (1778-1845), achieved a temporary *furor*; and it was with an attempt in the same direction¹¹ that the Austrian dramatist F. Grillparzer (1791-1871) began his long career. He is assuredly what he pronounced himself to be, the foremost of the later dramatic poets of Germany, unless that tribute be paid to the genius of H. von Kleist (1776-1811), who in his short life produced besides other works a romantic drama¹² and a rustic comedy¹³ of genuine merit, and an historical tragedy of singular originality and power.¹⁴ Grillparzer's long series of plays includes poetic dramas on classical themes¹⁵ and historical subjects from Austrian history.¹⁶ The Romantic school, which through Tieck had satirized the drama of the *bourgeoisie* and its offshoots, was in its turn satirized by A. Count von Platen-Hallermünde's (1796-1835) admirable imitations of Aristophanic comedy.¹⁷ Among the objects of his banter were the popular play-wright E. Raupach, and K. Immermann (1796-1840), a true poet, who is, however, less generally remembered as a dramatist. F. Hebbel¹⁸ (1813-1863) is justly ranked high among the foremost later dramatic poets of his country, few of whom equal him in intensity. Other names of literary mark are those of Chr. D. Grabbe (1801-1836), J. Moser (1803-1867), O. Ludwig (1813-1865), and "F. Halm" (1806-1871), and, among living writers, K. Gutzkow, G. Freytag, and H. Laube. The last of these names recalls The in one of their most noteworthy examples the long-continued G. " and systematic efforts which have raised the modern German stage to the position at present occupied by it among the the " theatres of Europe. These efforts have not been confined day. to fostering the art of acting in a succession of eminent representatives, among whom the sons of L. Devrient in various ways acquired a reputation worthy of their name, and B. Dawson was accounted the equal of the most brilliant of the brotherhood, or to maintaining as intimate a relation as possible between the stage and literature. Happily contrasting with other countries by the number and variety of its centres of intellectual life—rivals in artistic effort even where political or social rivalry is out of the question—Germany has not only cherished its own national drama, but with a catholicity of taste, aided by the powers of a language admirably adapted for translation, has opened its theatre to the dramatic masterpieces of other nations also, and more especially of our own. The German theatre has its weak points, and has not maintained itself wholly free from vicious influences; but upon the whole its efforts are on a level with the demands of the national culture, and in harmony with the breadth and variety of the national intelligence. No other stage furnishes the same opportunities for the study of dramatic literature.

With this summary of the history of the German drama it is necessary to close this survey. To be even nominally complete, it would have had to take into account the fortunes of more than one other modern European drama. But Among these the Dutch is interesting both in its beginnings, and

which resemble those of the German—the influence of the so-called chambers of the *rederykers* (rhetoricians), from the early years of the 15th century onwards, resembling that of the master-singers of contemporary Germany. The earliest of their efforts, which so effectively tempered the despotism of both church and state, seem to have been of a dramatic kind; and a manifold variety of allegories, moralities, and comic entertainments (*esbatementen* or comedies, *luuten* and *facien* or farces) enhanced the attractions of those popular pageants in which the Netherlands surpassed all other countries of the North. The art of acting flourished in the Low Countries even during the troubles of the great revolt; but the birth of the regular drama was delayed till the advent of quieter times. Dutch dramatic literature begins, under the influence of the classical studies cherished in the seats of learning founded before and after the close of the war, with the classical tragedies of S. Koster (c. 1585–c. 1650). The romantic dramas and farces of Gerbrand Bredero and the tragedies of Hooft belong to the same period; but its foremost dramatic poet was J. van den Vondel (1587–1659), who from an imitation of classical models passed to more original forms of dramatic composition, including a patriotic play¹ and a dramatic treatment of part of what was to form the theme of *Paradise Lost*. But Vondel had no successor of equal mark. The older form of Dutch tragedy—in which the chorus still appeared—was, especially under the influence of the critic A. Pels, exchanged for a close imitation of the French models, Corneille and Racine; nor was the attempt to create a national comedy successful. Thus no national Dutch drama was permanently called into life. Still more decidedly the dramatic literature of the SCANDINAVIAN peoples springs from foreign growths; but Denmark, where the beginnings of the drama in the plays of the schoolmaster Chr. Hansen recall the mixture of religious and farcical elements in contemporary German efforts, at a later date produced a comic dramatist of thorough originality and of a wholly national cast. L. Holberg (1684–1754), one of the most noteworthy comic poets of modern literature, not only marks an epoch in the dramatic literature of his native land, but he contributed to overthrow the trivialities of the German stage in its worst period, which he satirized with merciless humour,² and set an example, never surpassed, of a series of comedies³ deriving their types from popular life and ridiculing with

healthy directness those vices and follies which are the proper theme of the most widely effective species of the comic drama. Among his followers P. A. Heiberg (1758–1860) is specially noted. Under the influence of the Romantic school, whose influence has nowhere proved so long-lived as in the Scandinavian north, A. Oehlenschläger (1779–1850) began a new era of Danish literature. His productivity, which belongs partly to his native and partly to German literary history, turned from foreign⁴ to native themes; and other writers followed him in his endeavours to revive the figures of Northern heroic legend. The reaction recently observable in Danish literary criticism against the supremacy of the Romantic school may be expected to produce results in the drama, in the direction perhaps of those already attested by the success of two living Norwegian dramatists, H. Ibsen and Bjørnsterne Bjørnson.

Lastly, the history of the RUSSIAN drama, which in its earliest or religious form is stated to have been introduced from Poland (early in the 12th century), is in its later forms an outgrowth of Western civilization. A species of popular puppet-show called *vertep*, which about the middle of the 17th century began to treat secular and popular themes, had helped to foster the dramatic taste of the people; but the Russian regular drama characteristically enough had its origin in the cadet corps at St Petersburg, a pupil of which, A. Sumarokoff (1718–1777), is regarded as the founder of the modern Russian theatre. As a tragic poet he seems to have imitated Racine and Voltaire, though treating themes from the national history, among others the famous dramatic subject of the False Demetrius. He also translated *Hamlet*. As a comic dramatist he is stated to have been less popular than as a tragedian; yet it is in comedy that he would seem to have had the most noteworthy successors. Among these it is impossible to pass by the empress Catharine II. (1729–1796), whose comedies seem to have been satirical sketches of the follies and foibles of her subjects, and who in one comedy as well as in a tragedy had the courage to imitate Shakespeare. Comedy aiming at social satire has continued to flourish in Russia to the present day, and possesses (or recently possessed) a representative of mark in A. N. Ostrovsky of Moscow. The church is stringently protected against the satire of the stage in the dominions of the Czar, but in all other directions *except one* considerable licence appears to be allowed to the drama. (A. W. W.)

DRAMBURG, a town of Prussia, at the head of a circle in the government of Koslin, about fifty miles east of Stettin. It occupies both banks of the River Drage, a tributary of the Oder, is inclosed by walls and defended by a fort, contains a hospital and various administrative offices, and carries on cotton and woollen weaving, tanning, brewing, and distilling. Population in 1875, 5625.

DRAMMEN, a town in the amt of Buskerud, in Norway, is situated at the northern end of the Drammen fiord, a western arm of Christiania fiord, at the mouth of the Dramselv. It consists of the three places Bragerås or Bragnås, Strömso, and the port Tanguen, the first on the north, and the other two on the south side of the river. The greater part of the town has been rebuilt since the conflagrations of 1866 and 1870. The principal industrial establishments are oil, cotton, and tobacco factories, breweries, tanneries, sawmills, and iron foundries. An active trade in wood, pitch, and iron is carried on. The population at the end of December 1875 was 18,838.

DRAUGHTS, a game of unknown origin. Some consider it to be a very old game, but Strutt (*Sports and Pastimes*) calls it a "modern invention." It is not mentioned in the older editions of the *Académie des Jeux*, nor in the *Compleat Gamester*, so, if an old game, it was not formerly an important one. As early as 1668 M. Mallet published a treatise on draughts, at Paris, and the game was played in Europe at least a century earlier. The Romans played a similar game called *latrunculi*, the men moving diagonally, capturing by leaping over, and obtaining superior power when they arrived at the furthest row of squares. The board, however, consisted of only sixteen squares. It is believed that *πρωτοί* among the Greeks was a similar game with a central space "called the sacred barrier," and representations of a kind of draught game are frequently found on the monuments of the ancient Egyptians (Wilkinson).

Draughts is played by two persons. A board (see diagram) is required, and twenty-four men—twelve white

and twelve black—which at starting are disposed on the board as in the diagram. Either the white or black squares may be played on (the latter being now more usual). If the black squares are used the board must be

placed with a black square in the left hand corner; if the white squares are used, it is placed as in diagram.

The game is played by moving a man, one square at a time, along the diagonal to the right or left. Thus a man placed on square 18 in diagram can move to 15 or 14. Each player moves alternately, the first move being decided by lot.

As soon as a man is moved on the square adjacent to an opponent's man, and there is an unoccupied square beyond, the unprotected man may be captured and removed from the board. Thus, if there is a white man on square 18, and a black man on square 14, square 9 being vacant, and white having to move, he jumps over 14 and remains on square 9, and the man on 14 is taken up.

If two or more men are so placed that one square intervenes between each they may all be taken at one move. Thus if white having to move has a man on 29, and black men on 25, 18, and 10, the intermediate squares and square 6 being vacant, white could move from 29 to 6, and take the men on 25, 18, and 10. In making such a move with a man, all the steps must be forward, that is, in the direction away from the player, just as in making simple moves and captures.

It is compulsory to take if able. If a player has a man *en prise*, and makes a move that does not capture, his adversary may allow the move to stand without penalty, or he may have the move retracted and compel the player to take, or he may allow the move to stand and remove the man that neglected to capture from the board (called *huffing*). "Huff and move" go together, *i.e.*, the player who huffs then makes his move. The huff must be made before the move. If the adversary of the player who fails to capture allows the move to stand, without huffing, and the player who can capture moves again without taking, the adversary again has the options he had before. If a player can take one man in one place and more than one in another, he may take in which place he pleases, not being obliged to capture the larger number of men. But if he elects to take the larger number, he must take all of that lot that are *en prise*, or he may be huffed from where he stands when he has taken a portion of the men, or he may be compelled to take the remainder, or the incomplete move may be allowed to stand.

As soon as a man reaches one of the squares furthest from his side of the board, *e.g.*, when a white man (see diagram) reaches square 1, 2, 3, or 4, or a black man square 29, 30, 31, or 32, he is *crowned* by placing one of the captured men of his own colour on him, and becomes a *king*. A king has the additional power of moving and taking backwards, *i.e.*, toward his own side of the table, as well as forwards. But on becoming a king the move ends, notwithstanding that there may be an adverse man *en prise*. Thus if there are black men on squares 7 and 6, a

white one on 9, and squares 2 and 11 are unoccupied, white having to move takes the man on square 6 and becomes a king; but he cannot take the man on square 7 at the same move. A king can be huffed for not taking, the same as a man, with the exception just pointed out.

The game proceeds until one of the players has all his men and kings taken, or has all those left on the board *blocked*, so that he has no more left. If it should so happen that neither of the players has sufficient advantage in force or position to enable him to win, the game is drawn. The player having the stronger force may be required to win in forty moves (*i.e.*, forty on each side), computed from the move on which notice was given; if he fail, the game is drawn.

The game of draughts has been exhausted, *i.e.*, the reply to every possible move is known by all proficients, and as there is no advantage in moving first, every game ought to end in a draw. Under these circumstances rules for playing are of but little use; the only way to become a player is to study the analyses laid down in works on the subject, and to know them by heart. For beginners, however, it may be stated that men should as a rule be played to the middle of the board rather than to the sides, as in the middle the man attacks two squares, at the side only one. It is good play to push for a king early in the game. Also, as soon as a player has any advantage in force, he should exchange whenever he can. When the forces are equal the position of *having the move* should be striven for. To have the move means to occupy such a position as to be able to secure the last move. For example, place kings of opposite colours at 19 and 12. If the king at 12 is next to move, the king at 19 has the move and must win; but if the king at 19 is next to move, the other king has the move and the game must be drawn. Having the move does not always win. Thus at the beginning of a game the second player has the move, but at this stage it is of no use to him. When a player is in a cramped position it is often disadvantageous to have the move.

In order to ascertain who has the move, divide the squares into two systems of four columns each, the columns of one system being those which commence with the numbers 29, 30, 31, and 32 (see diagram), and end with the numbers 5, 6, 7, and 8, the remainder being the columns of the other system. Add together all the men and kings which stand in either system, and if their sum is odd the next player has the move, if even the last player has the move. For example, white has men or kings at squares 26 and 32, black at 28 and 19. There are three pieces on one system and one on the other, both odd. If white is the next player he has the move. An exchange generally, but not always, changes the move; so, when about to exchange, the player should prefer an exchange that will keep the move, or, not having it, an exchange that will gain it. To discover whether an exchange will change the move add together all the capturing pieces in both systems, and if they are odd and the captured pieces are also odd, the move is not changed by an exchange; the same rule applies if they are both even; but if one is even and the other odd, an exchange changes the move.

The laws of draughts used in match play are Anderson's, but so few matches at draughts are played that there is scarcely any demand for them, and they are out of print. Omitting those which relate only to match play, the following is an abridgment of Anderson's laws.

1. In a series of games the players take the white and black men alternately. Black has the first move, whether the previous game was won or drawn.
2. A player whose turn it is to play touching a man must move it, except he gives notice of adjusting the man, if it cannot be moved, he loses the game.
3. If a man is moved over an angle of the square on which it is stationed, the move must be completed in that direction.
4. The move is completed as soon as the hand is withdrawn from the man played to another square.

6 If a player who has the option of huffing touches the man he is entitled to remove, he must huff. 6 A false move loses the game. 7 If a player capture one of his own men by error, the adversary may have it replaced or not. 8 When more than one man can be taken at one move, the player must not remove his hand from the capturing man until he has taken all he can, if he does so the move is completed, and he is liable to be huffed. 9 When a player pushes a man to king, his adversary is bound to crown it. 10 Each player must move within a specified time [the time is generally three, five, or six minutes by previous agreement, unless there is only one way of taking or one move on the board, when only two minutes are as a rule allowed]. 11. The player having the stronger force may have notice given him to win in forty moves; when two kings remain against one, in twenty moves. When the odds of the draw are given, and the situations may be rendered equal by repeating the same manœuvres, the player giving the odds may be required to win in twenty moves.

POLISH DRAUGHTS was formerly played on a board of a hundred squares with forty men; but it is now more frequently played with an ordinary draught-board and men, the men being placed at starting as at draughts. The men move and take as at draughts, except that in capturing they move either forwards or backwards like a draught king. A man arriving at a crowning square becomes a queen, and has the move of a bishop at chess. In her capture she takes any unguarded man or queen in any diagonal she commands, leaping over the captured man or queen and remaining on any unoccupied square she chooses of the same diagonal, beyond the piece taken. But if there is another unguarded man she is bound to choose the diagonal on which it can be taken. For example, place a queen on square 29, and adverse men at squares 22, 16, 24, 14. The queen is bound to move from 29 to 11, 20, 27, and having made the captures to remain at 9 or 5, whichever she prefers.

The capturing queen or man must take all the adverse pieces that are *en prise*, or that become so by the uncovering of any square from which a piece has been removed during the capture, *e.g.*, white queen at square 7, black at squares 10, 18, 19, 22, and 27, the queen captures at 10, 22, 27, and 19, and the piece at 22 being now removed, she must go to 15, take the man at 18, and stay at 22, 25, or 29. In consequence of the intricacy of some of these moves, it is the rule to remove every captured piece as it is taken.

If a man arrives at a crowning square when taking, and he can still continue to take, he must do so, and not stay on the crowning square as at draughts. Passing a crowning square in taking does not entitle him to be made a queen.

In capturing, the player must choose the direction by which he can take the greatest number of men or queens, or he may be huffed. Numerical power is the criterion, *e.g.*, three men must be taken in preference to two queens. If the numbers are equal and one force comprises more queens than the other, the player may take whichever lot he chooses.

A single queen against three queens can draw. If one player has a queen and man, and the other three queens, the best play is to sacrifice the man, as the draw is more certain with the queen alone.

When two men of one colour are played on a diagonal with one vacant square between them (*e.g.*, at squares 16 and 23), the position is called a *lunette*. If the adversary enters the *lunette* he must capture one of the pieces which compose it. Before entering a *lunette* it is advisable to calculate what the position will be after a capture, as the position is sometimes intentionally left as a trap.

Painter, *Companion to the Draught Player*, 1767; Joshua Sturges, *Guide to the Game of Draughts*, London, 1800 (re-edited by Walker, 1835; reprinted with additions by Martin in Bohn's *Handbook of Games*, 1850); Henry Spayth, *The American Draught Player*. (H. J.)

DRAWING. Although the verb to draw has various Derivation. meanings, the substantive *drawing* is confined by usage to that of design, and is treated as if it were a synonym of design. The word comes from the Latin *trahere*, or from a kindred Gothic word, so that traction and drawing are nearly related, and preserve still the same meaning when applied to the work of animals or machines, as we say that a traction engine draws so many tons. Another form of the same word is *dray*, the strong low vehicle used by brewers and carriers. It may be worth while to inquire what is the connection between the idea of a dray horse and that of a drawing-master.

The primitive idea, which is the common origin of both The primitive idea. senses of the word to draw, is that of moving something in one's own direction. Thus, a horse draws a plough, but a carpenter does not draw his plane, he pushes it; and we should say that a locomotive drew a train when the locomotive was in front, but not when it was behind. The same idea is preserved in the fine arts. We do not usually say, or think, that a sculptor is drawing when he is using his chisel, although he may be expressing or defining forms, nor that an engraver is drawing when he is pushing the burin with the palm of the hand, although the result may be the rendering of a design. But we do say that an artist is drawing when he uses the lead pencil, and here we have a motion bearing some resemblance to that of the horse or engine. The fingers of the artist draw the pencil point along the paper. The analogy may be clearly seen in certain circumstances. When the North American Indians shift their camps they frequently tie a tent-pole on each side of the horse like a shaft, leaving the ends to drag along the ground, whilst their baggage is laid on cross pieces. Here we have a very close analogy with artistic drawing. The poles are drawn on the ground as a pencil is on paper, and they leave marks behind them corresponding to the lines of the pencil.

The same analogy may be observed between two of the The French verb *tirer*. senses in which the French verb *tirer* is frequently employed. This verb is not derived from *trahere*, but may be ultimately traced, like our own verb *to tear*, to the Ionic *δείπω*. It was formerly used by good writers in the two senses of our verb to draw. Thus Lafontaine says, "Six forts chevaux tiraient un coche," and Caillières wrote, "Il n'y a pas longtemps que je me suis fait tirer par Rigaud," meaning that Rigaud had drawn or painted his portrait. At the present day the verb *tirer* has fallen into disuse amongst cultivated Frenchmen with regard to the drawing and painting, but it is still universally used for all kinds of design and even for photography by the common people. The cultivated use it still for printing, as for example "cette gravure sera tirée à cent exemplaires," but here rather in the sense of pulling than of drawing.

A verb much more nearly related to the English verb to The French verb *traire*. draw is *traire*, which has *trait* for its past participle. It comes from *trahere*, and is so little altered as to be scarcely even a corruption of the original Latin form. *Traire* is now used exclusively for milking cows and other animals, and the analogy between this and artistic drawing is not obvious at first, nevertheless there is a certain analogy of motion, the hand passing down the teat draws the milk downwards. The word *trait* is much more familiar in connection with art as "les traits du visage," the natural markings of the face, and it is very often used in a figurative sense, as we say "traits of character." It is quite familiar in *portrait*, derived from *protrahere*.

The ancient Romans used words which expressed more Delineation. clearly the conception that drawing was done in line (*delineare*) or in shade (*adumbrare*), though there are reasons for believing that the words were often indiscriminately applied. Although the modern Italians have

both *traire* and *trarre*, they use *delineare* still in the sense of artistic drawing, and also *adombrare*.

The Greek
γράφειν.

The Greek verb *γράφειν* is familiar to the English reader in "graphic" and in many compounds, such as photograph, &c. It is worth observing that the Greeks seem to have considered drawing and writing as essentially the same process, since they used the same word for both. This points to the early identity of the two arts when drawing was a kind of writing, and when such writing as men had learned to practise was essentially what we should call drawing, though of a rude and simple kind. "The origin of the hieroglyphics of Egypt," says Dr Wilson (*Pre-Historic Man*, chap. xviii.), "is clearly traceable to the simplest form of picture-writing, the literal figuring of the objects designed to be expressed. Through a natural series of progressive stages this infantile art developed itself into a phonetic alphabet, the arbitrary symbols of sounds of the human voice." Even in the present day picture writing is not unfrequently resorted to by travellers as a means of making themselves intelligible. There is also a kind of art which is writing in the modern sense and drawing at the same time, such as the work of the mediæval illuminators in their manuscripts.

Picture-
writing.

The mental processes by which man has gradually become able to draw, in our modern sense of the word, may be followed, like the development of a chicken in the egg, by examining specimens at various stages of formation. His first efforts are remarkable for their highly abstract character, because the undeveloped intellect has few and simple ideas, and takes what it perceives in nature without being embarrassed by the rest. It seizes upon facts rather than appearances, and the primitive artist is satisfied when the fact has been clearly stated or conveyed by him. The study of appearances, and the effort to render them, come much later; and the complete knowledge of appearances is the sign of a very high state of civilization, implying most advanced artistic culture both in the artist and in the public to whom he addresses himself. The work of the primitive artist is an affirmation of the realities that he knew without mystery or confusion. In all early Egyptian work you see at once what the artist intended to draw, whereas the finest modern drawing is often so mysterious as to be most obscure to those who have not made a special study of the fine arts. The primitive artist knew that his work was really that of a writer, and as the sign-painter of the present day takes care to make his letters plain in order that they may be read, so the early Egyptian draftsman had no thought of any more delicate truth of appearance than that which sufficed to let people clearly understand what his figures and symbols were intended for. There was no conception of what artists call "effect," which enters into the greater part of modern drawing, until a very much later period.

Abstract
character of
earliest art.

We may mention briefly two survivals of primitive art in our own day, which have for their purpose a high degree of legibility. These are coats-of-arms and trade-marks. Heraldic drawing, when properly done, is executed on primitive principles, and is a survival of the earliest uses of graphic art, being really a kind of writing intended to be recognizable by the illiterate when they saw it on shield or banner. Modern trade-marks, of which the use has greatly extended of late years, are of the same class, and are often designed with a simplicity of intention like that of remote antiquity.

Archaic
forms of
drawing.

Archaic forms of drawing are thus not all extinct even in our own day, and certain arts are practised among us which compel the modern mind to recover by effort and study something of that simplicity and decision which were instinctive in earlier ages. Book-binding, illuminating, and designing for pottery are often rightly practised in

these days in an archaic spirit. In some of the best modern caricatures there are peculiarities which belong to early symbolic drawing, in which, as Dr Wilson says, "the figures are for the most part grotesque and monstrous from the very necessity of giving predominance to the special feature in which the symbol is embodied."

The first idea of drawing is always *delineation*, the *Delineation* marking out of the subject by lines, the notion of drawing without lines being of later development. In primitive work the outline is hard and firm, but interior markings are given also. When the outline was complete, the primitive artist would proceed at once in many cases to fill up the space inclosed by it with flat colour, but he did not understand light and shade and gradation. The historical development of drawing may always be seen in the practice of children when left to draw for their amusement. They begin, as the human race began, with firm outlines, representing men and animals, usually in profile. The next thing they do, if left to their own instincts, is to fill up the spaces so marked out with colours, the brightest they can get. This is genuine primitive art.

By referring to the earliest kind of drawing we perceive how drawing may exist without certain elements which in modern times are usually associated with it. We generally conceive of drawing in close association with perspective, and at least with some degree of light and shade, but it may exist independently of both. This may perhaps help us to a definition of drawing. Such a definition would need to be exceedingly comprehensive, or else it would certainly exclude some of the many arts into which drawing more or less visibly enters. A modern critic would be very likely to say that a figure was deficient in drawing if it was deficient in perspective, and yet the two are easily separable, as for example in the work of the mechanical draftsman; or drawing may be associated with a kind of perspective which is visually false, as isometric perspective. We might say that drawing was the imitation of form, but a moment's reflection would enable us to perceive that it may create forms without imitating, as it does in many fanciful conceptions of ornamental designers. It might be suggested that drawing was the representation on a flat surface of forms which are not flat, but the most variously curved surfaces, as in vases, are frequently drawn upon, and flat objects are sometimes represented on rounded surfaces. The Greeks were so logical in their use of *γράφειν* for both drawing and writing that it is not possible to construct a definition comprehensive enough to include all the varieties of drawing without including writing also. If we say that *drawing is a motion which leaves significant marks*, we are as precise as the numerous varieties of the art will permit us to be. *Defini*

Difficult
of a defini-
tion.

The first step in the arts of design is a resolute and *Con-* decided conventionalism. Drawing always begins with "line," and there are no lines in nature. The natural world presents itself to the eye as an assemblage of variously-coloured patches or spaces, always full of gradation both in shade and colour, but in all this there is no such thing as a real line. Even the sea-horizon, which is commonly spoken of as a line, is not so in reality, it is only the ending of a coloured space. The conventionalism of the line being once admitted, it may be considered as neither good nor bad in itself, but a simple necessity. Beyond this, however, in the use of the line when it has once been adopted, there may be artistic merit or demerit.

All primitive line-drawing gives a version of natural truth which is idealized in one way or the other, and it is always conventional not only in the sense of using conventional means, but also in that of interpreting natural forms with conventional amplifications or omissions. The temper of a primitive civilization always led its artists to the

expression of certain customary ways of seeing things which were transmitted traditionally by art, so that the artists in their turn became the means of imposing the authority of public sentiment upon their successors. The liberty of individual artists, even to draw what may seem such a simple thing as the outline of a human figure, is dependent upon the degree in which the civilization under which they live is or is not traditional.

To understand the effect of customary ways of seeing things on the use of pure line in drawing, the reader is recommended to study some specimens of early design as it was practised in China, in Japan, in Egypt, in Assyria, and in Greece. It is easy, in these days, to procure photographic reproductions of ancient design when the student does not live near a museum. He will perceive at once in the five countries four entirely different ways of seeing and designing the curvature of lines, although the Chinese and Japanese ways are nearer to each other than they are to the Egyptian or the Greek, whilst on the other hand, different as the two latter may be, they are nearer to each other than to the art of China or Japan.

A certain kind of curvature is dominant in Chinese art, along with the preference for certain easily recognizable forms. In Japanese drawings the curves are wilder, bolder, more unexpected, more audacious, and when the Japanese designer chose to make use of angles he was, from the same tendency to vivacity and exaggeration, disposed to prefer acute angles. In both Chinese and Japanese work, when at its best, there is often the most exquisite beauty and delicacy of line, especially in the contours of female faces, and there is frequently a masterly power in the interpretation of natural truth, or certain portions of natural truth, by means of the utmost simplicity.

In ancient Egypt the line was quieter and less "tormented" than in China or Japan, the curvature more restrained, and the artistic expression generally rather that of calm dignity than of vigorous action. Egyptian art was kept within the strictest limits by the most powerful conventionalism that ever existed, but the student of drawing will find much in it that is well worth his attention. The Egyptian draftsmen attained to a most noble use of line, combining a serious and disciplined reserve with much delicacy of modulation. The true grandeur of Egyptian work has only been apprehended of late years, because it was formerly supposed that its conventionalism was due to simple ignorance of nature and want of skill in art. It is of various degrees of excellence, and there were inferior artists in the early Egyptian schools, as in others, but we are often startled by magnificent power in conventionalizing natural material, and by a peculiar sense of beauty. There is in Egyptian design a singular combination of tranquil strength with refinement.

Assyrian design is very familiar to us through the ancient wall-sculptures, where the line is often rather engraved than carved, so that we can see quite plainly what were the qualities of drawing which the Assyrian artists valued. They, too, conventionalized nature, but sought for those curves and accents of line which express manly beauty rather than feminine. They drew, in their own way, admirably well, with great firmness and self-command, knowing always exactly what equivalents or representatives to give for the lines and markings of nature, in accordance with the spirit of their artistic system. Their art is much more strongly accentuated than the Egyptian, and we might even say that it is more picturesque while it is less tranquil. Assyrian design has more of the spirit of painting in it than Egyptian, and less of the spirit of sculpture. The Assyrian line tends to the expression of energy in action, the Egyptian to strength and beauty in repose.

Notwithstanding the high degree of power and skill attained in linear design by nations which existed before the artistic development of Greece, it must ever remain an inexplicable marvel that the Greek designers should have attained, apparently without effort and simply by the gift of nature, to a degree of perfection in the use of line which had never been approached before and has never been equalled since. The manly beauty of an Assyrian king at a lion hunt, with his curly beard and his muscular legs, and his arm mighty to bend the bow, is grand indeed, but with a purely barbaric grandeur; the half-feminine beauty of an Egyptian deity lives chiefly in the serene face—the body is often frankly architectural, and has always rather the qualities of a column than those of the living flesh. But in Greece the curves of the line were for the first time made to express the fulness and grace of life, with an ideal perfection coming from the exquisite innate taste and refinement of the artists, and never to be found in any single model. How much knowledge and taste may be expressed by a simple line may be seen in any Greek vase of the best time, especially if there are both draped and naked figures, of both sexes, in the composition.

The leading principle of Greek design on vases was the expression of form by pure, firm, and accurate line. Spaces were distinguished by flat tints of red, black, and white, but there was no shading to indicate modelling. When local colour could be easily hinted at by markings of black thicker than a simple outline, it was frequently done, as it was continually in Japanese art, but care was taken that these broader black markings should never be important enough to alter the true character of the design, as essentially a work in simple line. Thus, a woman's hair might be drawn with broad touches to make us see that it was darker than her flesh, and the dark band round the edges of her dress would be given in pure black of its own width. Nor was this the only device by which a certain degree of local colour was suggested to the eye, though it was not really imitated. The red did for ordinary flesh colour, and white for flesh-colour intended to be of more than ordinary fairness. Great spaces of black were reserved for the background, by which a striking relief was given to the figures. This is the regular principle of Greek vase decoration, though the artists did not strictly confine themselves to it, but would also work in simple black and white, as in the Portland vase, or introduce brighter colour sparingly, like the turquoise of the mantle of Thetis and in the wings of Eros in the vase of Camirus. This use of colour, however, did not in the least interfere with the unflinching system of Greek drawing, which was, in the strictest sense of the word, *delineation*. In this it differs absolutely from many modern kinds of drawing which avoid the line as much as the Greeks delighted in it. This is not intended as an expression either of praise or blame; it is simply a statement of fact.

The truth is that Greek line-drawing is simply the most perfect condition of a very early form of art. It is the child's idea of drawing, carried out with the knowledge and taste of men who lived in the early youth of the human race and were not disturbed and distracted by the discoveries and experiments of modern Europeans. Amongst its other peculiarities may be mentioned its beautiful independence of anatomy. No anatomical markings are ever given simply as such. The figures are living men and women with their skins on, not *écorchés* in a dissecting room. There is less of the anatomical tendency in Greek art than in Assyrian. When the Assyrian artist wishes to make you feel that a man's leg is very strong he maps out every muscle and tendon as far as his knowledge will allow, but the Greek contents himself with showing the vigour and ease of the strong man's action. It is, however, in

the representation of the female form that the grace of the Greek line-drawing is most conspicuous and most unprecedented. There had been before some lithe feminine grace of motion even in Egyptian art, but it is stiffness and awkwardness themselves in comparison with the Greek.

art educa-
tion.

The right progress of art-education in modern times could not be better assured than by following in the case of each individual student that course of development which humanity itself has followed. True and careful lines, in combination with the colouring of spaces in a few flat tints, are the natural beginning. What a child does with infantile unsuccess for its amusement the beginner in serious art should be taught to do carefully and well for his instruction. The accurate use of line is the first thing to be learned with the pencil point, and the equal laying of a flat tint is the first thing to be learned with the brush.

Even at so early a stage in art as the use of the simple line, we find ourselves face to face with one of the most remarkable peculiarities of the fine as distinguished from the mechanical arts. It does not require much critical acumen to discover that accuracy is one thing in a line and beauty another. The student ought to work at first for accuracy, but from beautiful works of art which are not in themselves accurate copies of nature but copies idealized at least in some degree by the taste and feeling of the artist. All works of art that are worth studying are ideal in one way or another. We have spoken of the Greek line, which is one of the most highly idealized of all artistic expressions. The Greek artists when they outlined an object always greatly simplified the outline by omitting many minor accidents of angle and curvature which a modern picturesque artist would seek for because of their variety. But simplification does not explain all that the Greek mind did to alter nature in design. Its sense of beauty and elegance was so exquisite that it continually amplified what was meagre in the model, reduced what was superabundant, and corrected what was awkward. All this could be done, and was done, with the simple line alone without any help from chiaroscuro, and it is one of the most remarkable proofs of the expressional power of the line that it even suggests modelling in the blank spaces which are inclosed by it.

Advantages
of studying
modern
design.

Notwithstanding the excellence of Greek linear design it would be well that the student's attention should not be confined to it too exclusively. For, in the first place, we may remember that the vase-paintings which remain to us were not executed by the most eminent painters living at that time, but were only done by clever workmen in the artistic spirit which the eminent painters had rendered prevalent and fashionable; whereas in modern art we can study the *ipsissima linea* of truly great men, both in their drawings and in many cases more accessibly still in their etchings. Again, the Greek designers had certain excellencies, but not all excellencies, the remarkably harmonious character of their work being, in fact, quite as much due to its absolute neglect of certain qualities of line as to its possession of other qualities. It is a narrow and limited kind of art, the singular perfection of it being due in great measure to that narrowness. Modern art, on the contrary, is infinitely vast and varied, full of imperfection, abounding in all conceivable kinds of error and failure, but also rich beyond all that a Greek could possibly have imagined in knowledge and sentiment of many kinds.

The Greek spirit passed through its first decadence in Roman art, and was at last degraded past recognition at Byzantium. A new spirit of linear design arose in the northern countries during the Middle Ages, gradually forming what we call the Gothic schools of architecture and

ornament. The mediæval artists began exactly like the Mediæval Greeks by the natural primitive process of line and flat drawing, colouring of spaces, of which we have abundant examples in their illuminated manuscripts, and examples less abundant in the mural paintings which remain to us. Students who intend to qualify themselves for decorative work, or for carving, will do well to give earnest attention to mediæval designs of ornament which abound in the richest and most fanciful invention; but students of the figure have little to learn from the Middle Ages, for in those centuries the figure was very imperfectly understood. Sometimes we meet with a startling exception, with some instance of individual observation which strikes us because it looks like science; but the plain truth is that the mediæval artists of all classes were as inferior to the Greek in the knowledge of the human frame as they were superior to them in the capacity for inventing new and fanciful schemes of decoration. If the student wishes to learn the figure he may therefore pass at once from the period of decline in Greek art to the Renaissance, without concerning himself about the more or less successful attempts of the intervening ages, in which, indeed, may be found examples of quaintly rendered human character, but hardly any of well-studied human form. The best way is to go from antiquity to Hans Holbein the younger at once. He had Holbein. remarkable power and skill in the use of line, many of his best portraits being hardly anything more than a delicately true outline, with just enough shading to make us understand the modelling, but nothing of what is commonly understood by chiaroscuro. As Holbein was much more of a realist than the Greeks were, his lines have more variety of curvature than theirs, and the forms inclosed by them are more individual. All that is best in the peculiar spirit of northern drawing at that time is to be found in Holbein's art, which is full of close observation, of calm sobriety, and unflinching truthfulness. In the south of Europe the Renaissance led to that artistic development of which the modern schools of figure design have inherited the ideas and principles. A certain period in the life of Raphael marks the transition from the old spirit to the new, and his great success in the application of the new principles led to their authoritative establishment in the schools of Europe. The Renaissance made drawing at the same time more scientific and more ideal. The artists studied anatomy more than it had ever been studied before, and they gave a degree of attention to the whole of the human body which a mediæval draftsman would have concentrated almost exclusively on the face. But they did not rest satisfied with copying the facts of nature and investigating the laws of construction and of action,—they took that farther step which the Greeks had taken before them, and drew the figure not merely as it appeared to their bodily eyes, but with that more perfect beauty which was suggested to the eye in the artist's mind. Raphael openly affirmed this principle by declaring that he drew men and women, not as they were, but as they ought to be, and the process of idealization may be actually seen in what he did by comparing his studies with his completed works.

The Re-
naissance

We have hitherto spoken simply of the use of line, that being essentially drawing in the strict sense of delineation; but when the European mind had reached the period of the Renaissance a new study took its rise—chiaroscuro—Chiar-
oscuro. which became so inextricably mingled with that of drawing that it is impossible to speak adequately of the one without giving some account of the other. The increased knowledge of the muscular structure of the body led the artists to pay more attention to modelling than had ever been paid to it before, so that good modelling got to be considered an essential part of drawing. It may be necessary, for the uninstructed in artistic matters to explain in this place

Modelling that modelling in design is the art of shading in such a manner as to give everything its due degree of projection or relief, and the practical difficulty of it lies in the necessity for making the degree of projection in any object or part of an object exactly what it ought to be relatively to other projecting masses or details in the same drawing. The simple line-work of the early stages of art was therefore abandoned by the greatest artists of the Renaissance as a general means of study. Even when using the most rapid means of expression for themselves alone, they were accustomed to treat the outline with little respect, and always to indicate shading in some way, often by the very rudest means, as for example by a few hasty diagonal strokes of the pen. Leonardo da Vinci retained to the last a good deal of that care about the outline which characterizes the earlier stage of art, but even in his case it was accompanied by an equal degree of care in modelling. In the sketches and studies of Michelangelo the care and time given to the outline are always in exact proportion to the pains taken with the modelling, and this employment of the time at the artist's disposal is a clear proof that he considered modelling as much a part of drawing as the outline itself. When he had time to do the modelling thoroughly, as in his finished studies, he made the outlines very carefully also, but when the time at his disposal was limited he did not economize it by making, as an earlier artist would probably have done, a careful outline without modelling,—he still gave both together, but in a rougher and readier way. The student can find no better examples of this treatment than any three sketches and studies of Michelangelo which may have cost him respectively five minutes, half an hour, and three or four hours of labour. The work in each instance is economized, not by rejection of one portion of his art, but by summarizing the whole, more or less, with the strictest reference to the time at his disposal. The studies of Raphael are done on the same principle.

L. da Vinci.

Michelangelo.

Exaggeration.

The spirit of the Renaissance was caught from the study of antiquity, but it gave more latitude to original genius by allowing a freer play to personal qualities in art. This led to bold exaggerations, which became a part of artistic expression, and were to it what emphasis is to the orator. Michelangelo himself set the example of this, and it may be observed that, whereas when the works of the ancients seem to lose their spirit on reduction to a smaller scale, and require to be accentuated by the copyist who reduces them, those of Michelangelo bear reduction easily by reason of their own strong accents and exaggerations. Leonardo da Vinci, being of a calmer temper, put little exaggeration into his finished works, which are distinguished by great suavity and sobriety of manner; but he gave it free play in his caricatures, which served as an outlet for the more violent side of his genius.

A kind of exaggeration almost universal during and since the Renaissance has been a more than natural marking of the muscles, which is opposed to the spirit of the best Greek design, and was directly due to anatomical studies, especially to the habit of dissection. This has continued down to our own day in all the learned schools of Europe. For example, in the St Symphorien of Ingres the figures of the Roman victors are drawn as if they were without skins, and every muscle is enormously exaggerated.

Measurement.

A better result of the scientific spirit of the Renaissance was the degree of care and attention which artists began to pay to the measurement of the human body, so as to determine its true proportions. Albert Durer made and recorded very numerous and careful measurements both of man and the horse, declaring that "no one could be a good workman without measuring," and that "it was the true foundation of all painting." Leonardo affirmed in words of equal plainness that "a young man ought to begin to learn perspective by measuring everything." This habit of measurement has been continued down to our own day by the more careful artists. Whenever an sculptor died in the Jardin des Plantes, at Paris, Barye threw or modelled at once to take all its measurements, and his life, notwithstanding his great skill in drawing by the place of the rise of the hand and arm, was now more picturesque and of what we call picturesque drawing, i.e. We all know what we mean by the word "picturesque" as applied to real objects; for example, we all admired a feudal castle or abbey, when it has become a temple in perfect picturesque ruin, but that a equally good repair repair is not. Even amongst the costumes the distinction is recognized, the costume that was worn by Charles II. was more accustomed to recognize by William Pitt. We are drawn in a manner the fact that almost any of which produces picturesque or and playful: the temper of the artist. The work is tolerant, observant, significant, which produces the other kind of forms to the simple or severely disdainful, range, and again to the purists of the Middle Ages, disapproved with the tendency of the Renaissance and in all their work is always either the most perfect development of a temple in Greece and in the drawing before our own century, its blameworthy in the great men of Dutch school working almost as the strongest successors. The severe spirit has maintained the place in Holland, the academic protest against the early the picturesque spirit in authoritatively taught in a manner by took place in spirit. The academies direct students benevolently in that spirit. The never to Rembrandt. On the theme, itself chiefly as a sort of drawing usually taught to of the picturesque, which is never especially through the medium of an academy of art. The strongest reaction against the pictures continually to Raphael, but the French "néo-Grecs," who in study the other hand, the kind of pure Greek line and flat space, the most earnest of them declaring that nothing more was needed to the perfection of art. The most perfect and studied picturesque in modern drawing will be found in the works of etchers and fusinists (artists who draw in charcoal). The picturesque is always easily recognizable by its love of accident and variety of line and character, and by its strong effects of light and shade. When in excess it violently exaggerates these accidents, varieties, and effects.

Landscape.

The kind of drawing which is best for landscape differs in some important respects from that which is best for the figure. To perceive the full truth of this, the reader has only to draw a landscape with the simplicity of the line in a Greek figure, when he will see that the more complicated character of landscape material requires a more varied interpretation. Good landscape draftsmen are seldom very accurate as to form, and it is not necessary that they should be; but they are always careful to preserve truth of character, and have great difficulties of their own to contend against, which are generally much underestimated. The inaccuracy of landscape design comes from the necessity for composition. When the figure painter composes, he can move his models about, and place them in different attitudes, and draw them faithfully after all; but when a landscape painter does the same thing, by an effort of imagination, with his mountains, trees, or towers, he unavoidably violates topographic accuracy. The habit of inaccuracy soon forms itself, for this reason, in all landscape draftsmen who compose; and all artists by profession are compelled to compose in order to make their works attractive in appearance.

ance and saleable. Simple studies of landscape may, however, be made with perfect accuracy, and are so done occasionally for special purposes. The best examples of such accurate landscape design to which we are able to refer the reader are the engraved studies of Mr Ruskin. Fine examples of artistic landscape design, in which natural scenery is well interpreted but not literally copied, are infinitely more numerous. The *Liber Veritatis* of Claude, and the *Liber Studiorum* of Turner, abound in fine examples of composed landscape, and a great number of illustrated works have been published during the present century, in which the student may find endless instruction.

Landscape design is usually taught to amateurs by drawing masters, because it is thought to be easier than that of the figure; but the choice of landscape for elementary instruction is unfortunate, because a beginner requires simpler and more definite material than is to be found in landscape nature. It is wiser for all beginners in art to study for a long time the most simple and definite objects which can easily be entirely detached from other objects and thoroughly studied by themselves. This was the true early classic manner of drawing, and the student who follows it in the present day will always be rewarded by an earlier insight into the qualities of form than can be attained by any other method. The truth of this is more fully recognized wherever drawing is taught seriously; but those who teach water-colour to amateurs too often encourage them in a confused way of looking at nature which, at the best, only results in a feeble imitation of fifth-rate water-colour landscapes, in which there is nothing worthy to be called drawing at all, nor any real rendering of form. It is of the utmost importance to amateurs that they should not misapply the little time which they can usually give to practical art, and yet they often do misapply it in many ways. A very common cause of loss of time, in their case, is false finish, and labour thrown away by the employment of methods which take more time than other methods for an inferior result, as, for example, when painful pen hatching is employed for shading where the chalk and stump, or charcoal, or the brush, would give a shade of far better quality in a twentieth part of the time. All truly great artists, though prodigal of labour when their purposes required it, have economized it whenever the economy was not artistically an evil, and this is often best seen in their sketches, which give rapidity, not by hurrying the hand, but by using the most summary means of expression. This art of summary expression in drawing is of great use to figure-painters, but it is still more important in landscape, because the effects of nature pass so rapidly that they do not permit any slow method of interpretation. Many of the fine sketches by great men have been done, without hurry, in a few minutes. Tinted papers are often used to economize time, because they supply a middle tint on which lights can be noted in white, and darks in chalk, charcoal, or a wash of water-colour. Good examples of sketches and studies by the greatest artists are now quite easily accessible through the photographic processes, and by their help a student at a distance from the national collections may easily learn for himself how they used the pen by itself, or the pen for line with a wash for shadow, or the lead pencil point, or chalks (white and black) on grey paper, or sanguine, getting a shade more quickly by one method, a line more precisely by another. Original drawings by great masters may be seen in all the capitals of Europe, in the public collections. Of late years drawings by modern artists have attracted more of the public attention than they did formerly, and "black-and-white" exhibitions have been successfully established in London, Paris, and New York. Through the influence of the South Kensington Museum and its affiliated schools of design the knowledge

of drawing is now becoming much more general in Great Britain than it has ever been before. The preliminary difficulties of the art can scarcely be overcome without the assistance of a master, but in his absence the student may obtain useful help from books.

The student should thoroughly master and remember Burnet's *Essay on the Education of the Eye*, which is most concise, and contains nothing doubtful or disputable. Mr Harding's works, and Mr Ruskin's *Elements of Drawing*, are also useful books for amateurs, especially if taken together. There are also various little treatises on elementary technical practice, usually written by artists, and published by the colour-makers, from which good practical hints may be obtained as to the use of instruments and materials. It is not generally known in England that there is a magnificent national collection of drawings by the old masters in the British Museum, to which access may easily be obtained on compliance with a simple formality. The student is earnestly recommended to avail himself of these treasures, which are generally strangely neglected. A handbook to the Department of Prints and Drawings, with an introduction and notices of the various schools (Italian, German, Dutch and Flemish, Spanish, French, and English) has been lately compiled by Mr Pagan, of the Museum, and published by Messrs Bell & Sons. A selection of drawings by the Italian masters in the British Museum has been lately published in autotype by Messrs Chatto & Windus, with notes by Mr Comyns Carr, which, it is to be hoped, will be followed by selections from other schools. It is much to be regretted that some portion, at least, of these national treasures should not be made readily accessible to the general public by framing them and exhibiting them under glass in a gallery, according to the plan adopted in the Louvre. Their very existence is not so much as suspected by the great majority even of cultivated Englishmen. (P. G. H.)

DRAYTON, MICHAEL (1563-1631), English poet, was born at Hartshill, near Atherston, in Warwickshire, in 1563. Even in childhood it was his great ambition to excel in writing verses. At the age of ten he was sent as page into some great family, and a little later he is supposed to have studied for some time at Oxford. Sir Henry Goodere became his patron, and introduced him to the countess of Bedford, and for several years he was supported by Sir Walter Aston. How the early part of his life was spent, however, we possess no means of ascertaining. It has been surmised that he served in the army abroad. In 1590 he seems to have come up to London, and to have settled there. In 1591 he produced his first book, *The Harmony of the Church*, a volume of spiritual poems, dedicated to Lady Devereux. The best piece in this is a version of the Song of Solomon, executed with considerable richness of expression. A singular and now incomprehensible fate befell the book; with the exception of forty copies seized by the archbishop of Canterbury, the whole edition was destroyed by public order. It is probable that he had come up to town laden with poetic writings, for he published a vast amount within the next few years. In 1593 appeared *Idea: The Shepherd's Garland*, a collection of pastorals, in which he celebrated his own love-sorrows under the poetic name of Rowland. The circumstances of this passion appear more distinctly in the cycle of 64 sonnets, published in 1594, under the title of *Idea's Mirror*, by which we learn that the lady lived by the river Anker, in Warwickshire. It appears that he failed to win his "Idea," and lived and died a bachelor. The same year, 1594, saw the publication of *Matilda*, an epic poem in rhyme royal, the first of his studies from English history. It was about this time, too, that he brought out *Endimion and Phæbe*, a volume which he never republished, but which contains some interesting autobiographical matter and acknowledgments of literary help from Lodge, if not from Spenser and Daniel also. In his *Fig for Momus*, Lodge has reciprocated these friendly courtesies. In 1596 Drayton published his long and important poem of *Mortimeriados*, which deals with the Wars of the Roses, and is a very serious production in ottava rima. He afterwards enlarged and modified this poem, and republished it in 1603 under the title of *The Barons' Wars*. In 1596,

also, appeared another historical poem, *The Legend of Robert, Duke of Normandy*, and a similar piece on *Piers Gaveston*. In 1597 appeared *England's Heroical Epistles*, a series of historical studies, in imitation of those of Ovid. These last poems, written in the heroic couplet, contain some of the finest passages in Drayton's writings. With the year 1597 the first half of the poet's literary life closes. He had become famous by this rapid production of volumes, and he rested on his oars. It would seem that he was much favoured at the court of Elizabeth, and he hoped that it would be the same with her successor. But when, in 1603, he addressed a poem of compliment to James I. on his accession, it was ridiculed, and his services rudely rejected. His bitterness of spirit found expression in a satire, *The Owl*, which he printed in 1604, although he had no talent in this kind of composition. Not much more entertaining was his scriptural narrative of *Moses in a Map of his Miracles*, a sort of epic in heroics printed the same year. In 1605 Drayton reprinted his most important works, that is to say, his historical poems and the *Idea*, in a single volume, which ran through eight editions during his lifetime. He also collected his smaller pieces, hitherto unedited, in a volume undated, but probably published in 1605, under the title of *Poems Lyric and Pastoral*; these consisted of odes, eclogues, and a fantastic satire, called *The Man in the Moon*. Some of the odes are extremely spirited. He then adopted the extraordinary resolution of celebrating all the points of topographical or antiquarian interest in the island of Great Britain, and on this laborious work he was engaged for many years. At last, in 1613, the first part of this vast work was published under the title of *Poly-Olbion*, eighteen books being produced, to which the learned Selden supplied notes. The success of this great work, which has since become so famous, was very small at first, and not until 1622 did Drayton succeed in finding a publisher willing to undertake the risk of bringing out twelve more books in a second part. This completed the survey of England, and the poet, who had hoped to "crown Scotland with flowers," and arrive at last at the Orcaades, never crossed the Tweed. In 1627 he published another of his miscellaneous volumes, and this contains some of his most characteristic and exquisite writing. It consists of the following pieces:—*The Battle of Agincourt*, an historical poem in ottava rima, and *The Miseries of Queen Margaret*, written in the same verse and manner; *Nymphidia*, the *Court of Faery*, a most joyous and graceful little epic of fairyland; *The Quest of Cynthia* and *The Shepherd's Sirena*, two lyrical pastorals; and finally *The Moon Calf*, a sort of satire. Of these *Nymphidia* is perhaps the best thing Drayton ever wrote, except his famous ballad on the *Battle of Agincourt*; it is quite unique of its kind, and full of rare fantastic fancy. The last of Drayton's voluminous publications was *The Muses' Elizium* in 1630. He died in London on the 23d of December 1631, was buried in Westminster Abbey, and had a monument placed over him by the countess of Dorset, with memorial lines attributed to Ben Jonson. Of the particulars of Drayton's life we know almost nothing but what he himself tells us; he enjoyed the friendship of some of the best men of the age. He corresponded familiarly with Drummond; Jonson, Browne, Wither, and others were among his friends. In one of his poems, an "elegy" or epistle to Mr Henry Reynolds, he has left some valuable criticisms on poets whom he had known. He was even engaged in the labour of the dramatists; at least he had a share, with Munday, Chettle, and Wilson, in writing *Sir John Oldcastle*, which was printed in 1600. That he was a restless and discontented, as well as a worthy man, may be gathered from his own admissions.

The works of Drayton are bulky, and, in spite of the high place that he holds in critical esteem, it cannot be

pretended that he is much read. For this his ponderous style is much to blame. The *Poly-Olbion*, the most famous but far from the most successful of his writings, is tedious and barren in the extreme. The metre in which it is composed, a couplet of Alexandrines, like the French classical measure, is wholly unsuited to our language, and becomes excessively wearisome to the reader, who forgets the learning and ingenuity of the poet in labouring through the harsh and overgrown lines. His historical poems, which he was constantly rewriting and improving, are much more interesting, and often rise to a true poetic eloquence. His pastorals are brilliant, but overladen with colour and sweet to insipidity. He is, with one or two magnificent exceptions, an indifferent sonneteer. The poet with whom it is most natural to compare him is Daniel; he is more rough and vigorous, more varied and more daring than the latter, but Daniel surpasses him in grace, delicacy, and judgment. In their elegies and epistles, however, the two writers frequently resemble each other. Drayton, however, approaches the very first poets of the Elizabethan era in his charming *Nymphidia*, a poem which inspired Herrick with his sweet fairy fancies, and which stands alone of its kind in our literature; while some of his odes and lyrics are inspired by noble feeling and high imagination.

In 1748 a folio edition of Drayton's complete works was published, under the editorial supervision of Oldys, and again in 1753 there appeared an issue in four volumes. But these were very unintelligently and inaccurately prepared. An attempt is now being made to edit Drayton in a more critical spirit. Three volumes of an edition (to be completed in six or eight volumes), collected by the Rev. R. Hooper, have already appeared, comprising the *Poly-Olbion* and the *Harmony of the Church*. (E. W. G.)

DREAM. Dreams are a variety of a large class of mental phenomena which may be roughly defined as states of mind which, though not the result of the action of external objects, resume the form of objective perceptions. To this class belong the fleeting images which occasionally present themselves during waking hours, and especially before sleep, the "visions" which occur in certain exalted emotional conditions, as in religious ecstasy, the hallucinations of the insane, the mental phenomena observable in certain artificially produced states (hypnotism), &c. These and other mental conditions resemble one another in many important respects, to be spoken of by and by. At the same time they are roughly marked off by certain special circumstances. Thus, dreaming may be distinguished from the other species of the class as depending on the most complete withdrawal of the mind from the external world. All products of the imagination which take the aspect of objective perceptions must, it is clear, involve a partial aberration of the intellectual processes. Yet in all cases except that of dreaming—including even somnambulism—the mind preserves certain limited relations to external objects. In dreams, on the contrary, the exclusion of the external world from consciousness is for the most part complete. Sleep has under normal circumstances the effect both of closing the avenues (sensory nerves) by which external impressions are conveyed to consciousness, and of cutting off from the mind that mechanism (the voluntary-motor nerves and muscles) through which it maintains and regulates its varying relations to the outer world. Dreams cover a great variety of mental states, from fleeting momentary fancies to extended series of imaginations. Again, dreams have certain constant or approximately constant features, while in other respects they manifest wide diversity. Among the most general characteristics is to be named the apparent objectivity of dream-experience. The presence of this objective element in dreams is clearly indicated in their familiar appellation "visions," which also points to the well-recognized fact that a large part of our dream-imagination simulates the form of visual perception.

The next general characteristic of dreams is that, though resembling waking experience in many respects, they seem never exactly to reproduce the order of this experience. Most of our dreams differ very widely from any events ever known to us in waking life, and even those which most closely resemble certain portions of this life introduce numerous changes in detail. These deviations involve one or two distinct elements. First of all, there is a great confusion of the order in time, space, &c., which holds among real objects and events. Widely remote places and events are brought together, persons set in new relations to one another, and so on. Secondly, the objects and scenes are apt to assume a greatly exaggerated intensity. They take a firmer hold of us, so to speak, than our waking experience. We may when awake think of dreams as unsubstantial and unreal, but to the dreamer at the moment his imagined surroundings are more real, more impressive, than the actual ones which he perceives when awake. Dream-fancy exaggerates the various aspects of objects, makes what is large still larger, what is striking still more striking, what is beautiful still more beautiful, and so on.

Having touched on these approximately universal characteristics of dreams, we will now specify a few of the more variable features. For example, in a large number of our dreams we appear to be passive spectators of events which we are incapable, or rather do not think, of controlling in any way. In other dreams, again, we seem to be lively actors in the scene,—talking, moving, &c., as we are wont to do in waking life. In a class of dreams lying midway between these two extremes we appear to be impelled to act, to be struggling to seize some offered good or to avert some threatening evil, yet to be unable to execute our wishes. Once more, dreams differ very much as to their degree of reasonableness. It is certain that in many cases the dreamer is easily imposed on, sees no contradictions, does not seek to understand the events which unfold themselves before his fancy, and so on. In some instances, indeed, the mind of the dreamer loses even the sense of identity in objects, and metamorphizes persons in the most capricious manner; and this confusion of identity may embrace the dreamer himself, so that he imagines himself to be somebody else, or projects a part of himself, so to speak, into another personality, which thus becomes an *alter ego* and an object for the contemplation of the remaining self. Yet though it is true that many, probably a large proportion, of our dreams, are thus unintelligible to waking thought, there is a number of well authenticated dreams in which persons have proved themselves to be possessed not only of their ordinary, but even of an extraordinary, power of reflection. We refer to the well-known stories of the intellectual achievements of Condillac, Condorcet, Coleridge, &c., when dreaming. Once more, great differences are observable in dreams with respect to the feelings excited by the visionary experiences. Sometimes the circumstances in which we find ourselves affect us much as in waking life;—danger terrifies us, beauty delights us, and so on. At other times, however, we are not thus affected,—what would puzzle, confuse, or shock our minds in waking experience fails to do so in dream-life. Finally, there are certain exceptional features of dream-life, as a vague consciousness of dreaming, which assumes the form of a dream within a dream, and the repetition of the images of previous dreams with a recognition of the familiarity of the dream scenes. It need hardly be added that dreaming varies greatly, both in quantity and in quality, according to individual temperament, habits of thought, &c.

Theories of Dreaming.—From the slight sketch of the character of the dreaming process just given, it might be conjectured that the human mind at all times would be profoundly impressed with the fact of dreaming, and seek

to arrive at some explanation of what on the surface is undoubtedly so mysterious and so wonderful a phenomenon. And as a matter of history we find that men have in all the known stages of their intellectual development endeavoured to account for the visions of the night. The various theories thus put forward fall into two main classes—the supernatural and the natural. By the former we mean all explanations which assume the action of forces unknown to our waking experience; by the latter those which make no such assumption, but seek to interpret dream-phenomena as products of forces familiar to waking perception. The supernatural hypothesis, again, falls into two divisions, according as the dream is regarded as the immediate effect of some reality corresponding to the actual world of our waking experience, or as it is conceived as a mediate result depending on the volition and command of some absent being. We thus have three main methods of explaining dreams:—(a) The naive objective explanation; (b) the religious explanation; (c) the scientific explanation.

(a) *The Dream as Immediate Objective Experience.*—According to recent researches the savage mind regards dreaming as no less real an objective experience than waking. The objects and scenes which flit before the dreaming fancy of the primitive man are real material existences, the sounds he seems to hear are real external sounds, the dream figures which stand before his imagination and converse with him are real persons. How then does he conceive the relation of this dream-world to the world of waking experience? This question has lately been answered by Mr E. B. Tylor and Mr Herbert Spencer. The belief in the objective reality of dreams requires the savage to conceive a double nature both for objects (animate and inanimate) external to himself and for himself. The vision of dead ancestors, of material objects long since lost or destroyed, easily suggests the idea of a duplicate of the original person or thing, a second self or soul. On the other hand, when the savage dreams that he goes forth to accustomed scenes, to hunt, to fight, and so on, he accounts for the dream by the supposition that his own second self or soul leaves the body and passes forth to the particular locality. Thus the dream-life shapes itself to our primitive philosopher as an intercourse of souls or duplicate selves, co-ordinate with, and of equal reality with, the experience of waking life. It appears to follow from the unfamiliarity of dream scenes, personages, &c., that the region visited during sleep will be projected by the savage mind quite outside the world of waking observation. Mr Spencer connects with this fact the earliest theories of another world or a spiritual state. (For a fuller account of the part played by dreams in primitive ideas consult E. B. Tylor, *Primitive Culture*, vol. i. chap. xi.; H. Spencer, *Principles of Sociology*, i. ch. x. et seq.)

(b) *The Dream as a Communication from a Supernatural Being.*—It is plain that even in the savage's conception of dreaming there is room for the thought of a divine announcement. When once the idea of superior beings, deities, demons, &c., is reached, it becomes natural to regard the visit of some departed soul as the despatch of a messenger to the dreamer. In this way the first mode of explanation passes insensibly into the second. In higher stages of religious thought the view of a dream as a divine revelation takes a less crude form. The immediate object present to the dreamer is no longer conceived as possessing the same degree of materiality. Something is still present, no doubt, and so the dream is in a sense objective; but the reality is less like a tangible material object, and is transformed more or less completely into something unsubstantial, spiritual, and phantasmal. On the other hand, the dream is objective in the sense of being a message or revelation from some actual divine personage. The essence of the

dream, so to speak, lies in the fact that it conveys to the dreamer something which the divine personage wishes him to know, whether it be the will of this being in the shape of a command or a prohibition, or some fact as yet unknown (past or future), the knowledge of which will be of practical utility to the recipient. We may distinguish three stages in this conception of dreams:—(1) The deity sends a messenger or angel who is vaguely conceived as a spiritual being clothed in a thin material vestment; (2) the divine communicator, dispensing with the medium of a material appearance, lets his message be heard by the dreamer as the utterance of an external voice; (3) he discloses his purpose by causing to pass before the soul a vision which is not distinctly conceived as objective, but rather as something mysteriously imprinted on the mind.

The divine communication which thus makes use of the medium of a dream will, it is plain, vary considerably in the degree of its intelligibility. Sometimes the meaning of the message is obvious and unmistakable. The actions to be performed and the facts to be known are revealed plainly and directly. This will be the case for the most part with the first and second forms of dream-communication. At times, too, the divinely created vision may distinctly picture some coming event in the individual or national life. On the other hand, the communication may be disguised and only partially divulged by symbol, in which case there arises the necessity of an art of interpretation. Thus at times the oral utterance may assume the form of a dim oracular declaration which calls for careful attention and a certain skill in the application of verbal figures. It is, however, in the last form of dream-revelation that we find the greatest demands made on the interpreter's art. It follows from what has been said respecting the novelty of dream-combinations that many of the visual images which make up so large a bulk of our dreams cannot easily be fitted to any actual order of events. Hence, if such dreams are to be interpreted as having a bearing on actual events, they must be regarded as figurative or symbolic. Accordingly we find that the symbolic function of dreams has been fully recognized in all the theories of dreaming now dealt with. It seems to have been assumed that the normal mode of divine communication to man during sleep was that of such a figurative dream. And agreeably with this supposition the task of deciphering dream-symbols gradually grew into a skilled art, which became the prerogative of a certain class of experts,—as prophets, diviners, or magicians.

A very brief historical review of this religious theory of dreams must here suffice. Among the Oriental peoples this view of dreams was the prevailing one. We find, however, great differences in the mode of interpretation adopted. Among the ancient Hebrews, for example, we find all the three forms of dream-communication mentioned above. As to interpretation there seem to have been no definite rules, and the procedure followed resolves itself into an attempt to discover the most natural or least forced application of the persons, objects, and relations of the dream to some existing persons, social circumstances, and events. This mode of interpretation clearly left wide scope for individual skill. In the Persian scheme of interpretation, on the other hand, so far as we can judge of it from the compilations of a later age, the art of dream-interpretation, *oneirocritics*, or *oneiromancy*, was defined and fixed in a number of rules. Thus in the work known under the name of the *Sifat-i-Sirozah*, minute and elaborate prescriptions are given for interpreting various classes of dreams according to the particular day of the month on which they occur. A similar systematization of the rules of dream-interpretation is to be met with among the Arabs (see *L'Onirocritie Musulman*, par Gabborhachaman, traduction de Pierre Vattier.) In

such cases, it is plain, the interpretation of dreams involved less of individual genius or inspiration, and became a more mechanical process, involving only careful knowledge of formulæ, and one which could be easily communicated. Such a state of things points to the transition of dream-lore from the stage of an esoteric mystery to that of a common-sensical science. Among the Greeks and Romans the religious view of dreams is to be found in popular literature as well as in philosophic writings. In Homer, dreams are distinctly said to be sent by the gods and goddesses, as in the expression *θεῶν ὄνειρος*, and it is implied that they may be intended to deceive the subject of them (e.g., Agamemnon's dream, *Iliad*, book ii.). Similarly the dramatists frequently speak of foreknowledge divinely communicated by dreams (e.g., Clytemnestra's prescience as to the fall of Troy in the *Agamemnon* of Æschylus is ascribed to a dream). The popular view was countenanced to a certain extent by philosophers. Thus Plato found room in his mystic scheme of knowledge for the idea of a divine manifestation to the soul in sleep. In the *Timæus* (chaps. xlv. and xlvii.) a prophetic character is distinctly assigned to the images of dreams. These divine inspirations (divinations) are not, however, given to the rational soul, but to the lower appetitive soul through the medium of the sensible images of rational truths which are reflected on the liver, an organ contiguous with the bodily seat of the appetitive soul. These prophetic visions are received only when the reasoning faculty is fettered by sleep or alienated by disease and enthusiasm. In this way the divine artificer has given to the inferior regions of the soul a certain substitute for rational knowledge. At the same time the interpretation of the visions requires intelligence, and hence the business of receiving them and of interpreting them does not properly belong to the same persons. Even Aristotle treats the supposition of divine revelation in dreams very considerably when he writes, in the treatise *περί μαντικῆς τῆς ἐν τοῖς ὕπνοις*, "that there is a divination concerning some things in dreams is not incredible." The Stoics, again, to judge from Cicero's account of their views in his *De Divinatione*, reasoned *a priori* that the gods, if they love men and are omniscient as well as all-powerful, will certainly disclose their purposes to man in sleep. Chrysippus is, on the same authority, said to have written a volume on the interpretation of dreams as divine portents. Cicero's brother Quintus, who here defends the orthodox theory of dreams, speaks of a skilled interpretation of dreams which is a true divination, even though, like all other arts in which men have to proceed on conjecture and on artificial rules, it is not infallible. The current views of dreams of classic antiquity are supposed to be to some extent embodied in the *Ὀνειροκριτικά* of Daldianus Artemidorus of Ephesus (written about the year 170). Here the interpretation of dreams is reduced to a body of elaborate rules. To dream of a particular element, as fire, air, &c., of a particular plant, part of the body, and so on, always signifies the same kind of event for the same kind of person. It is the over-looking of the age, social condition, &c., of the dreamer which, in the view of Artemidorus, leads to the abuse of dream-interpretation. He attempts to draw a distinction between *ὄνειρος*, a vision having a real bearing on events, and *ἐνύπνιον*, a mere dream having no actual significance; but this does not, according to Liddell and Scott, correspond with classical usage. The divine origin of dreams became a doctrine of the Christian church. It appears in the writings of the fathers, being defended partly on biblical, partly on classic authority. Synesius of Cyrene (born 375) has left a treatise on dreams (*περί ἐνυπνίων*). He puts forward certain psychological hypotheses drawn largely from Plato and Plotinus and ascribes to the imagination

(which is intermediate between the soul and the animal part) the power of accompanying the soul in its flights to the celestial regions, and so of sharing in the contemplation of divine truths. Synesius exalts the rank of dreaming among the arts of divination, setting it far above other modes of prophecy as being most simple and sure, open to all, unencumbered with expensive and laborious preparations, and so on. He affirms that he has repeatedly found dreams of service in arranging his ideas, and in improving his style of composition. Mediæval and modern Christian theologians have continued to attribute dreams, or, more accurately, certain orders of dream, to the intermediate agency of the divine Being. The popular theory of dreams to be met with among the later European peoples bears the impress of that folk-lore which developed itself in the Middle Ages under influences partly Christian, partly pagan. Dreams were referred to a variety of supernatural agencies, including not only God and the devil, but also subordinate beings, as fairy, fiend (incubus), &c. Further, the art of interpreting dreams according to definite rules (oneiromancy) was developed to a very high point. (See Brand, *Popular Antiquities*, vol. iii. *Dictionary of Dreams*.) In our own times certain restricted classes of dreams are customarily associated with the action of benevolent or malignant beings. On the other hand, people are now wont to interpret dreams as omens or signs without distinctly attributing them to any supernatural agent. This view of dreams forms the transition-point between the religious and the scientific theories.

(c) *The Dream as a Subjective Phenomenon Dependent on Natural Causes*.—While the theory of the divine or supernatural origin of dreams has thus held its ground so long, there has been gradually growing up from an early period of human history a more scientific conception of the phenomenon as dependent on natural laws (of mind and body). Psychologists and physiologists alike have approached the subject from their respective points of view, and sought to explain the phenomena of dreaming as natural events. The first germs of a scientific theory of dreams are to be found in antiquity. Thus Democritus, from whom the Epicureans derived their theory, held that dreams are the product of the simulacra or phantasms of corporeal objects which are constantly floating in the atmosphere, and which attack the soul during repose. Again, Plato speaks in the *Republic* of dreaming as illustrating the dominant mental impulses and habits of the individual (unchecked appetite, and temperance with intellectual pursuits), and thus connects it with the normal waking operations of feeling and thought. Aristotle in his short treatise on dreams (*περί ἐνυπνίων*) refers dreaming to the action of objects of outward sense which leave behind impressions on the soul and bodily frame. Dreaming is said to be the function of the sensitive part of the mind, but of this so far as phantastic; and a dream is defined as "the phantasm arising from the motion of sensible perceptions when it presents itself to him who is asleep." Aristotle further has some correct observations on the immediate bodily conditions of dreaming, and on the exaggeration of sensation in this condition of mind. Thus, he says, we fancy it thunders and lightens when a small sound is produced in our ears; we imagine that we are eating honey in consequence of a defluxion of the least quantity of phlegm. In the *De Divinatione* of Cicero we have almost an unique instance among classic writings of a complete rejection of the doctrine of the supernatural origin of dreams, and of a full and consistent adoption of the natural method of explaining the phenomena. Cicero's position stands in marked contrast to that of partial sceptics, as, for example, Pliny, who seems content to exclude from the supernatural method of explanation certain

of the more obviously natural dreams, such as those occurring immediately after food and wine, or when one has just fallen asleep after waking (*Nat. Hist.*)

While philosophers were thus learning to regard dreams as natural processes, physicians, on the other side, had their attention called to dreaming in its relation to pathological bodily conditions. It seems probable, indeed, that men occupied in studying bodily diseases were among the first to suspect the true nature and origin of dreaming. Thus Hippocrates, while inclined to admit that some dreams may be divine, distinctly says that others arise from the action of the mind and the body. Hippocrates, too, appears to have been the first to supply a scientific basis for the premonitory character of certain kinds of dreams. There are dreams, he says, which announce beforehand the affections of the body. This idea has, as we shall see presently, been confirmed by modern pathological observations. It is easy to understand that this prognostic side of dreams was in the early stages of knowledge greatly exaggerated. This appears to be true of the speculations of Galen, who held that to dream one's thigh was turned into stone signified the approaching loss of this member. This belief in the premonitory character of dreams was only one side of a general doctrine of dreams according to which they arise from bodily disturbances, and so may serve as symptoms which the physician has to include in the complete diagnosis of a disease. This idea, which is recognized by modern physiologists as true within certain limits, led in the first crude stages of scientific investigation to exaggerated and fanciful conclusions. Thus a new system of dream-interpretation came into vogue according to which to dream of a certain thing always means a disturbance in one particular organ. In the doctrines of Oriental physicians (the Hindus and Chinese) dreams are thus referred to pathological states of the five organs—heart, lungs, kidneys, spleen, and liver. Thus to dream of war and fighting signifies a bad state of the lungs; of fire, smoke, &c., a bad state of the heart, and so on.

Modern Theory of Dreams.—Under this head we shall give an account of the principal results of modern investigations, psychological and physiological, on the nature and conditions of dreams. Respecting many points there is still considerable diversity of view. Certain questions of fact yet remain unanswered, the reason of this being the unaccessibility of dream-phenomena to accurate and adequate observation. Further, owing to the divided condition of psychological principles, the explanation of dreaming assumes very different forms with different writers. On the one hand there are those who conceive the mind as an independent spiritual substance, which employs the body as its instrument, but is not dependent on this. With these, dreams will naturally wear the aspect of products of some spiritual faculty or faculties which are not involved in the sleep of the body and the senses. At the other extreme are those who regard mental phenomena as an outcome of bodily changes, as a refined result of physical processes. By these, dreams will be regarded as given off, so to speak, by the various organs of the body during sleep. Midway between the spiritualist and materialist hypotheses is the scientific view in its narrower sense, namely, the doctrine that the mental and the bodily are perfectly dissimilar regions of phenomena, which are yet connected in such a way that bodily events appear as the conditions of mental events. In the following account of modern dream theory we shall confine ourselves for the most part to the last stand-point, though indicating here and there how the other theories of the relation of mind to body lead to divergent conclusions.

On the very threshold of our inquiry we are met by a much disputed question—What is the relation of dreaming

to sleep? Is dreaming an indication of imperfect sleep which must cease as soon as the higher nervous centres reach a complete repose? Is it, on the other hand, something wholly spiritual and independent of sleep as a bodily condition? Here we have two different views arising from different theories of the relation of mind and body. These distinct views of the subject have commonly appeared as answers to the question of fact—Are we when asleep always dreaming? This question was first raised by philosophers in connection with certain conceptions of the soul and its activity. Descartes, who regarded thought as of the essence of personal existence, was naturally led to maintain that the mind is always thinking. "I am," he says, "I exist, that is certain; but for how long? as long as I think, for perhaps even it might happen that if I ceased wholly to think I should cease at the same time wholly to exist" (*Meditation ii.*) Among the Cartesians the proposition, the mind is always thinking, became a leading tenet. Locke argues against this supposition. He contends that in sleep men do not always think, or they would be conscious of it. If it is asserted that they dream but they forget it, he replies it is "hard to be conceived" that "the soul in a sleeping man should be this moment busy a-thinking, and the next moment in a waking man not remember nor be able to recollect one jot of all those thoughts." To suppose that in sleep the soul thinks apart from the body involves the absurdity of a double mind, and is further contradicted by the irrationality of dreams (*Essay*, book ii. ch. 1.) Locke was answered by Leibnitz in the *Nouveaux Essais*, who upheld the Cartesian affirmation, and maintained that during sleep the mind has always some "little perceptions" or "confused sentiments," though, according to his doctrine of unconscious perceptions, these need not become objects of conscious attention. That we never sleep without dreaming is further maintained by Kant in his *Anthropologie*, by Jouffroy and others. In his *Lectures on Metaphysics*, Sir W. Hamilton argues fully for the same idea. He says that during sleep the mind "is never either inactive or wholly unconscious." He seeks to refute the argument of Locke, that we ought to remember our dreams, by calling attention to the fact that the somnambulist has no recollection of his dream, and that persons who betray in their expression and utterance the fact of dreaming retain no recollection of the state. He further holds that the continuity of dreaming is proved by the fact that whenever we are suddenly roused from sleep we find ourselves dreaming.

While metaphysicians have thus in the main affirmed the continuity of dreams, those who regard mental phenomena as invariably connected with bodily conditions have for the most part viewed dreaming as only an occasional accompaniment of sleep. By some, indeed, dreaming is viewed as confined to the transition state from sleeping to waking, though this view is now rejected by physiologists no less than by metaphysicians. It is true that the great rapidity of dream-thought has been proved, *e.g.*, by the experience of Lord Holland, who fell asleep when listening to somebody reading, had a long dream, and yet awoke in time to hear the conclusion of the sentence of which he remembered the beginning. And this takes off from the value of Hamilton's argument that we always find ourselves dreaming when awakened, for such dreaming may clearly be an incident of the transition state. Yet the other facts emphasized by Hamilton, as well as the results of Maury's experiments, to be spoken of presently, show that we may dream when soundly sleeping. On the other hand, we cannot, it is certain, directly prove that we are always dreaming during sleep. Many physiologists are disposed to regard dreaming as the accompaniment of some slight disturbance, whether arising from the lower organs or from

an undue excitability of the brain and its nervous connections; and according to this view the continuity of dreaming would seem to be an improbable supposition. To the physiologist the idea of perfectly unconscious sleep presents no difficulties. The results of experiment show him that the lower bodily (vegetative) functions are independent of cerebral activity; and the phenomena of swooning, the effects of anæsthetics, &c., familiarize him with the temporary suspension of the conscious activity of the brain. Hence the view commonly adopted by physiologists seems to be that dreaming is only an occasional incident of sleep. (See the article on "Sleep and Dreams" by Dr Carpenter in Todd's *Ency. of Anat. and Physiol.*) At the same time certain physiologists, as Sir H. Holland (*Chapters on Ment. Physiol.*) and Sir Benj. Brodie (*Psychological Inquiries*), are disposed to think that dreaming is the rule and not the exception.

The question whether we are always dreaming during sleep leads up naturally to the inquiry into the causes or conditions of dreams. This question has been approached from different sides. On the one side, metaphysicians have sought to account for dreaming by some simple theory of a suspension of certain mental faculties. On the other side, writers have tried to explain dreaming as a result of simple bodily operations. We will just glance at one or two of these simple hypotheses. A common view among metaphysicians is that the nature of dreaming is amply explained by the absence or suspension of the will. The importance of the cessation of the will's action has been emphasized by Dugald Stewart (*Elements of the Phil. of the Human Mind*, vol. i. chap. v. sect. 5). Stewart does not mean that the will is wholly dormant in sleep, but that it loses its hold on the faculties. By this supposition he seeks to account not only for the incoherence but also for the apparent reality of dream-images. That the absence of the normal processes of volition, especially as involved in attention, constitutes one important factor in the explanation of dreaming seems to be admitted by all writers,—for example, Dr Darwin (*Zoonomia*), Sir Benj. Brodie, Dr Carpenter, and M. Alf. Maury (*Le Sommeil et les Rêves*). It is doubtful, however, whether this simple hypothesis explains all that Stewart refers to it. Maury objects to Stewart's theory that the will does not wholly lose its command of the bodily organs, &c., in dreams.

While great stress has thus been laid by some writers on this negative condition, the suspension of will, others have sought to construct a simple theory of dreaming by supposing the unimpeded action of some special mental faculty. Thus Cudworth (*Treatise concerning Eternal and Immutable Morality*) reasons, from the orderly coherence of dream-imaginings and the novelty of their combinations, that this state of mind arises from the action of "the phantastical power of the soul," and not from "any fortuitous dancings of the spirits." A very curious theory of dreaming as depending on a particular circumscribed faculty of the soul is to be found in Scherner's *Das Leben des Traumes*. Dreaming is a decentralization of the movement of life. In waking consciousness the central force, the ego spontaneity, is supreme,—in dreaming the activity of the ego becomes purely receptive. The central ego is now merely the point about which the peripheral life plays in perfect freedom. Thus the will (the spontaneous ego) is suspended, and thought loses its categories. On the other hand, the imagination now freed from the ego reaches its perfect unrestrained function. And this function is seen in the symbolic representation both of the bodily parts and of the mental stimuli which influence consciousness in sleep. A similar conception of the action of the creative fancy in dreaming is adopted by Dr Johannes Volkelt (*Die Traumphantasie*.)

In addition to these simple metaphysical and psychological theories of dreaming, there are to be found no less simple physiological hypotheses. Among these we may take the opinion of Hobbes (*Leviathan*), that the imaginations of dreams all proceed from "the agitation of the inward parts of a man's body," the disturbance of which parts, owing to their connections with the brain, serves to keep the latter in motion. Another simple physiological hypothesis for explaining dreams is offered by Schopenhauer. According to this writer, the exciting causes of dreams are impressions received from the internal regions of the organism through the sympathetic nervous system. These impressions are afterwards worked up by the mind into quasi-realities by means of its "forms" of space, time, &c.

This simple and "geometric" method of explaining dreams, though it may be valuable up to a certain point, must necessarily fail to account for all the phenomena concerned. As we have shown in our preliminary description of dreams, their contents vary within very wide limits, and cannot therefore all be referred to one or two simple principles whether mental faculties or bodily stimuli; also, it is by no means safe to affirm of any mental function that it is universally absent in dreams, since the second mental processes, as Sir H. Holland and M. Maury point out, enter in very unequal degrees into different dreams.

A full and exhaustive theory of dreaming would seem to include several distinct lines of inquiry. Among these there are three which have already been well defined by recent writers on the subject. The first relates to the sources of dream-imaginings, or the stimulations which are the immediate causes of these. The second question has to do with the order or form of dream-combinations, and seeks to determine the conditions of the peculiar arrangements, simultaneous and successive, which are observable in dreams. The last problem is that of accounting for the objective reality and generally for the intensity and impressiveness of dream-fancies.

In briefly opening up each of these lines of inquiry we shall seek to keep in mind the variable as well as the constant features of dreaming; also we shall proceed, as far as possible, according to that double method of study, the psychological and the physiological (subjective and objective), which offers itself to those who accept the idea of a perfect parallelism between mental and bodily events.

(A) *The Sources of Dream Materials*—The numerous images which make up the ever-renewed current of a dream appear sometimes to come from the internal depths of the mind itself. In other cases, as even the ancients recognized, they depend on a stimulation of the brain arising from varying conditions of the bodily organs. According to the view that all mental events have their physical accompaniments, the first class of imaginings must also be referred to certain conditions of the brain and nervous system. These various sources of dream-activity are roughly classified by Hartley in his *Observations on Man*. Dream-images, he tells us, are deducible from three causes:—(1) impressions and ideas lately received; (2) present state of the body (especially the stomach and the brain); (3) association. The large part played by bodily states in our dream-life is recognized not only by physiologists, as Maury, but also by those who ascribe dreams in part to occult spiritual faculties, as Scherner. By help of the results of recent researches we are able to improve a little on Hartley's classification. The exciting causes of dream-images fall into two main classes:—(I.) peripheral, and (II.) central stimulations. The latter arise in the outlying parts of the nervous system, namely, the organs of sense, the muscular apparatus, the internal bodily organs, together with the external portions of the nerves connected with these.

Central stimulations are such as arise mainly, if not entirely, within the encephalic region. These again are either (a) direct, or (β) indirect. The first depend on the condition of the nerve-elements acted upon, and the unknown influences (possibly connected with the condition of the circulation) brought to bear on these at the moment. The indirect stimulations arise as a result of some preceding excitation in a connected region of the brain. The former underlie the apparently spontaneous imaginings of dreaming, as well as those which are the echo of a recent waking experience. The latter are the physical counterpart of images or ideas called up by association with preceding images or thoughts.

(I.) Among peripheral stimulations are to be noticed (a) those which arise from the action of external objects on the organs of sensation. Recent researches show that these may play an important part in dreams. Dr Beattie speaks of a man who could be made to dream about a subject by whispering into his ear. Experiments were made by M. Giron de Buzareingues (*Journal de Physiol* tom viii.) as to the effects of external impressions on dreaming. Thus, by leaving his knee uncovered during sleep, he dreamt he was travelling in a diligence (where knees are apt to get cold). The most elaborate experiments bearing on this point have been carried on by Alf. Maury, with the help of an assistant. The latter produces some external stimulation while the experimenter sleeps, he is then awakened up so as to record the dream immediately resulting. By this means important results were reached. When, for example, his lips were tickled, he dreamt that he was subjected to horrible tortures, that pitch plaster was applied to his face and then torn off. Sensations of hearing, smell, and taste were also followed by appropriate though greatly exaggerated images. Wundt (*Physiologische Psychologie*) thinks that cutaneous sensations, arising from the varying pressure and temperature of the bodily surface, are frequent excitants of dream-images. (β) Along with such objective sensations must be reckoned subjective sensations which arise in the absence of external stimuli, and which have as their physical basis certain actions in the peripheral as well as the central regions of the nerves. Of such are the visual images (*Schlumberbilder*) seen by J. Müller, Goethe, Purkinje, and others, when the body is disposed to sleep. These are called the dream-chaos by Gruithuisen, since they are supposed to form the raw material of dreams. Maury gives a full account of these phenomena, which he terms "hypnagogic hallucinations," and which appear to include not only visual images but also subjective sensations of sound, touch, &c. He attaches great importance to the action of these subjective sensations in dreams. The predominance of visual imagery in dreaming appears to be connected with the great activity of the organ of sight and its consequent excitability. It is to be added that one can only roughly distinguish these subjective sensations, which involve the peripheral regions of the nervous system, from images supposed to be confined to the central regions. (γ) The conditions of our muscles during sleep, which somehow convey impressions to the brain, affect consciousness, and so influence dreaming. To this source we must refer the active phenomena of dreams, as running, flying, resisting, struggling, &c. It is probable, as Wundt remarks, that the movements of the body during sleep, as those of breathing and the extensions and contractions of the limbs, give rise to dream fancies, and painful conditions of the muscles due to an awkward position of the limbs may also serve to excite images. (δ) Among the most frequent excitants of dreams are organic or systemic sensations connected with the varying states of the internal bodily organs. The prominence given to this source of dreaming

in ancient and modern systems of medicine has already been referred to. States of the stomach, lungs, heart, secretory organs, teeth and gums, &c., are, as we all know, powerful provocatives of dreams. Owing to the close connection of dreams with these organic conditions they may serve as important elements in the diagnosis of bodily disease. Thus M. Macario (*Du Sommeil, des Rêves, et du Somnambulisme*) recognizes among the morbid class of dreams those which are "prodromic," or premonitory (e.g., a dream of sanguinary conflict before hemorrhage), as well as those which are symptomatic of existing bodily and mental disorders.

(II.) We pass to internal or cerebral excitations. Under (a), the direct excitations, are to be included all dream-ideas which do not arise from bodily stimuli, or through association with preceding feelings and ideas. It seems fairly certain that many of our dream-images are thus occasioned by a kind of "automatic excitation" of the cerebral regions. The dreams which clearly arise from an after-effect in the brain of recent perceptions, especially those of the previous day, appear to illustrate this process. Also, many of the images which correspond to persons and scenes supposed to be long since forgotten may be due to some such local automatic cerebral "sub-excitation." Many distinctly recognizes this factor in dream-stimulation. It appears from experiences recorded by him that by means of these automatic central excitations images may sometimes be called up of objects which have never been distinctly perceived, and which yet have left a trace of their action on the cerebral substance. (β) The indirect central stimulations include, no doubt, a large number of our dream-fancies. When once a starting-point is reached, whether through a peripheral or a central automatic (direct) excitation, the nervous connections which answer to mental associations provide a vast range of new cerebration. It is to be added that the very same causes which excite particular cerebral regions to automatic action must affect other and connected parts in a less degree, producing a powerful predisposition to activity. Hence it is to be supposed that links of association which are insufficient to restore an idea to consciousness in the waking state may suffice to do so in sleep.

(B) *The Order of Dream-Combinations.*—Dreams are commonly said to be incoherent, and this is no doubt frequently the case. On the other hand many dreams appear to simulate orderly arrangements of objects and successions of events. It must follow that on simple theory, such as that the mind has lost the forms of thought—as space, time, and causation (which, as we have seen, is contradicted by Schopenhauer)—will cover all the facts. The absence of volition and voluntary attention goes far to throw light on dream-combinations. In dreaming, as Maury observes, attention, instead of dominating the images which present themselves, is itself dominated by these. At the same time, as we shall see presently, the action of attention, though no longer controlled by the will and directed to some practical end, plays an important part in dream-construction. In order, if possible, to get at the laws of dream-structure, we may roughly divide dreams into two classes.—(α) the disconnected and incoherent, and (β) the coherent

(α) The want of coherence in disorderly dreams appears to arise from the play of association acting on all the heterogeneous and disconnected elements supplied by peripheral and central (direct) stimulation at the time, there being no volitional control (dominating attention) to interfere with the process. Supposing that these two primary sources are continually sending forth new and disconnected images to the dream-consciousness, and that owing to the extreme excitability of the brain during sleep numerous

paths of association open themselves up in connection with every such image, we may see how it is that objects group themselves, and events succeed one another in such a chaotic manner. It is not correct to say that we here dispense with the "forms" of space and time; objects are viewed in space, and events "intuited" in time, it is only that the particular positions of things in space and time are overlooked. On the other hand, it is true that there is in these loosely-threaded dreams, if not in all dreams, a suspension of the reasoning process by which objects are intuited in a causal relation. In these dreams, then, the mind is passive, and consciousness is made up of a flux of images and feelings which is not analyzed and rationalized as it is in the normal processes of waking perception.

(β) Let us now consider the more coherent class of dreams. These, as we have seen, have by some been accounted for as the products of some occult power of the soul, as the "phantastical power" of Cudworth and the symbolic plastic phantasy of Scherner. There is no doubt that in many of the more elaborate and pictorial of our dreams a result is reached very similar to the products of the waking imagination. Can this operation be analyzed into simple processes? First of all, the images, however disconnected their corresponding objects may be, group themselves in a certain arrangement. This process would be described by psychologists of the Kantian school as the superposition on the dream-materials of certain mental forms. On the other hand, it may perhaps be explained as a result of association. When two orders of impression—for example, the sight of the human form and the sound of a human voice—have been habitually associated, there arises what may be called a general associative disposition to connect some variety of one order of impression with any particular variety of the order which happens to present itself to the mind, and so, when dreaming, the mind is disposed to add to images of colour certain relations of space, position, magnitude, &c., to images of human beings some form of the appropriate human actions, relations, &c. By this means the intuitive clearness and completeness of our dream-imaginings may largely be accounted for. It is to be added that these general associative tendencies do not determine what particular relations or actions are to be attributed to the images of sleep. These latter depend on the particular circumstances of the moment, as, for example, the locality of the optic fibres involved, the varying excitability of the central regions, &c.

In this factor of our dream-constructions the mind seems to be wholly passive. We have now to turn to a second influence, which involves to some extent the active side of the mind, namely, the play of attention under the influence, not of the will, but of certain vague emotional impulses. The chief of these are the feeling for unity, and the instinct of emotional harmony. First of all, there seems to be a tendency in the more orderly dreams to bring new images into some intelligible connection or relation of unity with the pre-existing ones. This vague impulse, acting through the processes of expectation and attention, becomes selective, leading to a detention of those members of the over-renewed flux of images which are fitted to enter into the dream-scene as consistent factors. In certain cases, indeed, this process seems to rise to something like a conscious voluntary exertion. We occasionally remember that we strove in our dream to discover a consistency in the variegated and confused scene presented to consciousness. Secondly, the unity of dream-structure is largely determined by the need of emotional harmony. A large part, if not all, of our dream-fancies are attended with a feeling of pleasure or of pain. Now, when a certain state of emotion has been excited in the mind, there is a tendency to reject all ideas

which conflict with this feeling, and to accept any which harmonize with it. The emotion controls the movements of anticipation and of intellectual attention, so that suitable ideas are at once recognized and detained. The unity of our most complex dreams appears to arise very largely from this source. In dreams described by Scherner, Volkelt, and Wundt the successions of imaginary events are clearly strung together by a thread of emotion, as joy, terror, and so on. The commonest example of such a dominating emotional tone in dreaming occurs when there is a current of pleasurable or painful feeling contributed by the condition of some of the internal organs of the body. These bodily sensations become the basis of complex groups of images, each new scene being connected with some analogous shade of feeling, "bodily" or "mental."

(C) *The Objective Reality and Intensity of Dream-Imaginations.*—These are explained by Hartley by two circumstances,—first, the absence of any other reality to oppose to the ideas which offer themselves; and secondly, the greater vividness of the visible ideas which occur in dreams as measured by the corresponding waking ideas. This last fact may, he thinks, be partly accounted for by an increased heat of the brain. As already remarked, Dugald Stewart explains the reality of dreams through the suspension of the ordinary action of volition. In waking life, he says, we distinguish objective impressions from ideas by finding that the former are independent of volition, while the latter are dependent on the same. Hence, in dreaming, when the will no longer controls ideas, these are mistaken for realities. The chief influences here concerned appear to be included in Hartley's theory, though the circumstances emphasized by Stewart may be a secondary element in the case. That the reality of dream-images depends in large part on the absence of external impressions has been recognized by most recent writers. Among others M. Taine (*De l'Intelligence*) dwells on the function of external sensation as a corrective to internal imaginations, keeping these below the illusory stage. External impressions are distinguished from ideas in the waking state, in part at least, by their greater intensity. When this relation is no longer recognized by reason either of the ideas acquiring preternatural vividness or of the sensations being withdrawn, illusion follows. Waking hallucinations depend on the first circumstance, dream-illusions on the second, perhaps also on the first as well. This leads us to the reflection that during sleep the ideas arising in consciousness undergo an increase of absolute as well as of relative vividness. That is to say, they are in themselves more intense states of consciousness than waking ideas. This seems to point, as Maury observes, to an increased excitability of the nervous substance in sleep. This same circumstance, too, helps to account for the preternatural impressiveness and the exaggeration which meet us in dream-life. If the brain is during sleep peculiarly excitable it will follow that all sensational stimuli, external and internal alike, will produce an exaggerated result. Thus the intensity of sensations will be augmented, and their volume, and so the apparent magnitude of dream-images be increased. Again, if in dreaming the stream of fancies be a rapid one, if images simultaneously and successively crowd in on consciousness, we may understand how space and time may appear to swell to unusual proportions. Once more, the peculiar excitability of the brain will manifest itself in an exaggeration of all feeling. Slight bodily discomforts, for example, will be transformed, as in Maury's experiments, into huge sufferings, and so locally circumscribed bodily sensations of pleasure may expand into preternatural forms of emotional delight.

We are now perhaps in a position to explain the symbolic function of dreams so much emphasized by

Scherer. He considers that our dream-phantasy habitually represents the seat of bodily sensations under the symbol of a house and its parts, and the silent processes of thought as the audible conversation of living persons. The latter remark is probably correct, and its truth follows from a consideration of the close association between thought and audible speech. The former observation is surely an exaggerated statement, as has been shown by his friendly critic Volkelt. Yet though bodily sensations do not as a rule reveal themselves under the symbol of a building or mass of buildings, they undoubtedly do appear in consciousness disguised and transformed; and the reasons of this are plain. Even in the waking condition we have but a vague consciousness of the seat of the bodily sensations, and in sleep this can hardly be present at all. In addition to this, the exaggerating influences just referred to must tend to disguise the real nature of bodily sensations, and so to remove all consciousness of their locality. Hence bodily sensations do as a rule clothe themselves in a disguise appearing under the form of emotional experiences. And the particular pleasurable or painful images selected, which will vary with the individuals' emotional nature and experience, will be apt to recur as a "symbolic expression" of this variety of bodily feeling. It will follow, too, from the predominance of visual ideas in dreams, that these emotional fancies will commonly take the shape of alluring or alarming visual perceptions.

Dreaming is a subject of great interest by reason of its points of contact with other mental conditions. Thus the common suspension of many of the higher processes of emotion, thought, and volition suggests an analogy between the dreaming state and the instinctive stage of mental growth as observable in children, primitive men, and the lower animals. This aspect of dreams has been treated by Maury.

Again, dreaming has many curious resemblances to the mental states of the insane. The differences which mark off dreaming from these states have already been given. The resemblances between them are no less important. In the illusory intensity of its internal images, in the rapidity of its flux of ideas, and in the wildness and incoherence of its combinations, the dream stands very close to the whole class of hallucinations and illusions of waking life. In truth, a systematic psychological treatment of dreams must connect them with other forms of illusion. This is done, for example, by Wundt, who refers all these groups of phenomena to an increased excitability of the sensory regions of the brain. Maury seems disposed to regard dreaming as the incipient stage of a pathological mental condition, of which somnambulism, insanity, &c., are more fully developed forms. Among other writers who have discussed dreams in relation to these other abnormal states of mind are Macario (*op. cit.*), Bierre de Boismont (*Les Hallucinations*), J. Moreau (*Du Haschisch et d'Alienation Mentale*), also Sir H. Holland, and Dr Carpenter (*Mental Physiology*).

A good deal of random and undigested information respecting dreams and dream-theories is to be found in Mr Frank Seafeld's *Literature and Curiosities of Dreams*. A curious account of the ancients' views of dreams is to be met with in a work entitled *Histoire du Somnambulisme*, par Austin Gauthier. For the best statement of the modern theory of dreams, the student is referred to the works of Maury, Wundt, Carpenter, and Volkelt, already named. Dreams have been roughly classified according to the source of their images and the relative activity of association and imagination involved, by Scherner, Volkelt, and others. The view of the processes involved in the imaginative construction of dreams here adopted has been more fully developed by the present writer in an article in the *Cornhill Magazine* of November 1876. (J. S.)

DREDGE, THE NATURALIST'S, an implement constructed on the general plan of the common oyster-dredge, and used by naturalists for obtaining specimens of the

animals living on the bottom of the sea at greater or less depths, for the purpose of determining their structure and zoological relations, and ascertaining their geographical distribution. The instrument usually employed in this and other northern countries for dredging oysters and clams is a light frame of iron about 5 feet long by a foot or so in width, with a scraper like a narrow hoe on one side, and a suspending apparatus of thin iron bars which meet in an iron ring for the attachment of the dredge-rope on the other. From the frame is suspended a bag about 2 feet in depth of iron chain netting, or of wide-meshed hempen-cord netting, or of a mixture of both. Naturalist dredgers at first used the oyster dredge, but it is scarcely suitable for scientific purposes. Having a scraper on one side only, it is liable in a current, in deep water, or in unskilled hands, to fall on its back and consequently to come up empty, the scraper not having come into play. Oyster dredgers are not allowed to take oysters below a certain size, and the commercial dredge is so contrived as to allow all small bodies to fall through, and, as many of these are of the highest interest to the naturalist, his object is thus in a great measure defeated.

The remedy for these defects is to have a scraper on each side, with the arms attached in such a way that one or other of the scrapers must reach the ground in whatever position the dredge may fall; and to have the dredge-bag deeper in proportion to the size of the frame, and of a material which is only sufficiently open to allow the water to pass freely through, with the openings so distributed as to leave a part of the bag close enough to bring up the finest mud.

The late Dr Robert Ball of Dublin devised the modification which has since been used almost universally by naturalists in this country and abroad under the name of "Ball's Dredge" (fig 1). The dredges on this pattern, used in Britain for ten years after their first introduction, about the year 1838, were usually small and rather heavy—not more than 12 to 15 inches in length, by 4 or 4½ inches in width at the mouth. Two scrapers, the length of the dredge-frame, and 1½ to 2 inches wide, were set at an angle of about 110° to the plane of the dredge's mouth, so that when the dredge was gently hauled along it took hold of the ground and secured anything loose on its surface.

Latterly Ball's dredges of considerably larger size have been used. Perhaps the most convenient form for dredging from a row boat or a yawl is that represented in the figure. The frame is 18 inches long, and its width is 5 inches. The scrapers are 3 inches wide, and these are so set that the distance across between their scraping edges is 7½ inches. The ends of the frame connecting the scrapers are round bars of iron five-eighths of an inch in diameter, and from these bars two curved arms of round iron of the same thickness, dividing beneath into two branches, which are attached to the ends of the cross-bars by eyes allowing the arms to fold down over the dredge-mouth, meet in two heavy eyes at a point 18 inches above the centre of the frame. The total weight of the dredge frame and arms is 20 lb; it ought to be of the best Lowmoor or Swedish wrought iron.

The thick inner edges of the scrapers are perforated by round holes at distances of about an inch, and through these strong iron rings about an inch in diameter are

FIG. 1.—Ball's Naturalists' Dredge.

passed, and two or three similar rings run on the short rods which form the ends of the dredge-frame. A light iron rod, bent to the form of the dredge opening, usually runs through these rings, and to this rod and to the rings the mouth of the dredge-bag is securely attached by stout cord or strong copper wire. The dredge-bag for a dredge of this size should be about 2 feet deep; and probably the most suitable material is hand-made netting of very strong twine, the meshes half an inch to the side, the inter-spaces contracting to a third of an inch across when the twine is thoroughly soaked. So open a network would let many of the smaller things through, and to avoid this, and at the same time to give free egress to the water, the bottom of the bag, to the height of about 6 inches, is lined with "bread-bag," a light open kind of canvas. It may be said that in such a dredge many valuable small objects may be washed through the meshes of the upper part of the dredge along with the mud and thus lost; but, on the other hand, if the bag be very close it is apt to get filled up with mud at once, and to collect nothing more.

For work round the coasts of Europe, at depths attainable from a row-boat or yawl, probably the best kind of line is bolt-rope of the best Russian hemp, not less than 1½ inches in circumference, containing eighteen to twenty yarns in three strands. Each yarn should bear nearly a hundred weight, so that the breaking strain of such a rope ought to be about a ton. Of course it is never voluntarily exposed to such a strain, but in shallow water the dredge is often caught among rocks or coral, and the rope should be strong enough in such a case to bring up the boat, even if there were some little way on. It is always well, when dredging, to ascertain the approximate depth with the lead before casting the dredge; and the lead ought always to be accompanied by a registering thermometer, for the subsequent haul of the dredge will gain greatly in value as an observation in geographical distribution, if it be accompanied by an accurate note of the bottom-temperature. For depths under 100 fathoms the amount of rope paid out should be at least double the depth; under 30 fathoms, where one usually works more rapidly, it should be more nearly three times; this gives a good deal of slack before the dredge if the boat be moving very slowly, and keeps the lip of the dredge well down. When there is anything of a current, from whatever cause, it is usually convenient to attach a weight, varying from 14 lb to half a hundred weight, to the rope 3 or 4 fathoms in front of the dredge. This prevents in some degree the lifting of the mouth of the dredge; if the weight be attached nearer the dredge it is apt to injure delicate objects passing in.

In dredging in sand or mud, the dredge-rope may simply be passed through the double eye formed by the ends of the two arms of the dredge-frame; but in rocky or unknown ground it is better to fasten the rope to the eye of one of the arms only, and to tie the two eyes together with three or four turns of rope-yarn. This stop breaks much more readily than the dredge-rope, so that if the dredge get caught it is the first thing to give way under the strain, and in doing so it often alters the position of the dredge so as to allow of its extrication.

The dredge is slipped gently over the side, either from the bow or from the stern—in a small boat more usually the latter—while there is a little way on, and the direction which the rope takes indicates roughly whether the dredge is going down properly. When it reaches the ground and begins to scrape, an experienced hand upon the rope can usually detect at once a tremor given to the dredge by the scraper passing over the irregularities of the bottom. The due amount of rope is then paid out, and the rope hitched to a bench or rollock-pin. The boat should move very slowly, probably not faster than a mile an hour. In still

water or with a very slight current the dredge of course anchors the boat, and oars or sails are necessary; but if the boat be moving at all it is all that is required. It is perhaps most pleasant to dredge with a close-reefed sail before a light wind, with weights, against a very slight tide or current, but these are conditions which cannot be commanded. The dredge may remain down from a quarter of an hour to twenty minutes, by which time, if things go well, it ought to be fairly filled. In dredging from a small boat the simplest plan is for two or three men to haul in, hand over hand, and coil in the bottom of the boat. For a large yawl or yacht, and for depths over 50 fathoms, a winch is a great assistance. The rope takes a couple of turns round the winch, which is worked by two men, while a third hand takes it from the winch and coils it down.

The dredge comes up variously freighted according to the locality, and the next step is to examine its contents and to store the objects of search for future use. In a regularly organized dredging expedition a frame or platform is often erected with a ledge round it to receive the contents of the dredge, but it does well enough to capsize it on an old piece of tarpauling. There are two ways of emptying the dredge; we may either turn it up and pour out its contents by the mouth, or we may have a contrivance by which the bottom of the bag is made to unlace. The first plan is the simpler and the one more usually adopted; the second has the advantage of letting the mass slide out more smoothly and easily, but the lacing introduces rather a damaging complication, as it is apt to loosen or give way. Any objects visible on the surface of the heap are now carefully removed, and placed for identification in jars or tubs of sea-water, of which there should be a number secured in some form of bottle basket, standing ready. The heap should not be much disturbed, for the delicate objects contained in it have already been unavoidably subjected to a good deal of rough usage, and the less friction among the stones the better.

Close to the place where the dredge is emptied there ought to be a tub about 2 feet in diameter and 20 inches deep, provided with a set of sieves so arranged that the lowest sieve fits freely within the bottom of the tub, and the three remaining sieves fit freely within one another. (fig 2) Each sieve has a pair of iron handles through which the hand can pass easily, and the handles of the largest sieve are made long, so that the whole nest can be lifted without stooping or putting the arms into the water. The upper smallest sieve is usually deeper than the others; it is made of a strong open net of brass wire, the meshes half an inch to a side. The second sieve is finer, the meshes a quarter of an inch to a side; the third is finer still; and the fourth is so close as only to allow the passage of mud or fine sand. The sieves are put into the tub, and the tub filled up to the middle of the top sieve with sea-water. The top sieve is then filled with the contents of the dredge, and the set of sieves are gently moved up and down by the handles of the bottom sieve in the water. It is of great importance not to give a rotatory motion to the sieves in this part of the process, for this is very ruinous to fragile organisms; the sieves should be gently churned up and down, whether singly or together. The result is that the rougher stones and gravel and the larger organisms are washed and retained in the upper sieve; the fine mud or sand passes through the whole of the sieves and subsides to the bottom of the tub; while the three lower sieves contain, in graduated series, the objects of intermediate

FIG 2.—Set of Sieves

size. The sieves are examined carefully in succession, and the organisms which they contain are gently removed with a pair of brass or bone forceps into the jars of sea-water, where their movement and their natural colours may be observed, or placed at once in bottles of strong or weak spirit of wine or dried, according to the object for which they have been collected.

The scientific value of a dredging depends mainly upon two things,—the care with which the objects procured are preserved and labelled for future identification and reference, and the accuracy with which all the circumstances of the dredging—the position, the depth, the nature of the ground, the date, the bottom-temperature, &c.—are recorded. Every specimen, whether dry or in spirit, should be labelled at once with the number under which this particular dredging is entered in the dredger's note-book.

Up to the middle of last century the little that was known of the inhabitants of the sea beyond low-water mark seems to have been gathered almost entirely from the objects found thrown on the beach after storms, and from chance captures on lead-lines, or by fishermen on their long lines, and in trawls and oyster and clam dredges. The naturalist's dredge does not appear to have been used for investigating systematically the fauna of the bottom of the sea until it was employed by Otho Frederick Müller in the researches which afforded material for the publication, in 1779, of his admirable *Descriptions and History of the rarer and less known Animals of Denmark and Norway*. In the preface to the first volume Müller gives a quaint description and figure of a dredge (fig 3) not very unlike that used by Hall and Forbes, only the mouth of the dredge was square, a form which, unless used with great caution, gives fatal facilities for "washing out" in the process of hauling in.

At the Birmingham meeting of the British Association in 1839 an important committee was appointed "for researches with the dredge with a view to the investigation of the marine zoology of Great Britain, the illustration of the geographical distribution of marine animals, and the more accurate determination of the fossils of the Pliocene period." Of this committee Edward Forbes was the ruling spirit, and under the genial influence of his contagious enthusiasm great progress was made during the next decade in the knowledge of the fauna of the British seas, and many wonderfully pleasant days were spent by the original committee and by many others who from year to year were "added to their number." Every annual report of the British Association contains communications from the English, the Scottish, or the Irish branches of the committee; and in 1850 Edward Forbes submitted its first general report on British marine zoology. This report, as might have been anticipated from the eminent qualifications of the reporter, was of the highest value; and, taken along with his remarkable memoirs previously published, "On the Distribution of the Mollusca and Radiata of the Ægean Sea," and "On the Zoological Relations of the existing Fauna and Flora of the British Isles," may be said to mark an era in the progress of human thought.

The dredging operations of the British Association committee were carried on generally under the idea that at the 100-fathom line, by which amateur work in small boats was practically limited, the zero of animal life was approached—a notion which was destined to be gradually undermined, and finally overthrown. From time to time, however, there were not wanting men of great skill and ex-

FIG 3.—Otho Frederick Müller's Dredge (1770).

perience to maintain, with Sir James Clark Ross, that "from however great a depth we may be enabled to bring up mud and stones of the bed of the ocean we shall find them teeming with animal life." Samples of the seabottom, procured with great difficulty and in small quantity from the first deep soundings in the Atlantic, chiefly by the use of Brooke's sounding machine, an instrument which by a neat contrivance disengaged its weights when it reached the bottom, and thus allowed a tube, so arranged as to get filled with a sample of the bottom, to be recovered by the sounding line, were eagerly examined by microscopists; and the singular fact was established that these samples consisted over a large part of the bed of the Atlantic of the entire or broken shells of certain Foraminifera. Dr Wallich, the naturalist to the "Bulldog" sounding expedition under Sir Leopold McClintock, reported that star-fishes, with their stomachs full of the deep-sea Foraminifera, had come up from a depth of 1200 fathoms on a sounding line; and doubts began to be entertained whether the bottom of the sea was in truth a desert, or whether it might not present a new zoological region open to investigation and discovery, and peopled by a peculiar fauna suited to its special conditions.

In the year 1868, while the question was still undecided, two testing investigations were undertaken independently. In America Count L. F. Pourtales, one of the officers employed in the United States Coast Survey under Professor Pierce, commenced a series of deep dredgings across the Gulf Stream off the coast of Florida, which were continued in the following year, and were productive of most valuable results; and in Great Britain the Admiralty, on the representation of the Royal Society, placed the "Lightning," a small gun vessel, at the disposal of a small committee to sound and dredge in the North Atlantic between Shetland and the Faroe Islands.

In the "Lightning," with the help of a "donkey-engine" for winding in, dredging was carried on with comparative ease at a depth of 600 fathoms, and at that depth animal life was found to be still abundant. The results of the "Lightning's" dredgings were regarded of so great importance to science that the Royal Society pressed upon the Admiralty the advantage of continuing the researches, and accordingly, during the years 1869 and 1870, the gun-boat "Porcupine" was put under the orders of a committee consisting of Dr Carpenter, F.R.S., Dr Gwyn Jeffreys, F.R.S., and Professor Wyville Thomson, F.R.S., one or other of whom superintended the scientific work of a series of dredging trips in the North Atlantic to the north and west of the British Islands, which occupied two summers.

In the "Porcupine," in the summer of 1869, dredging was carried down successfully to a depth of 2435 fathoms, upwards of two miles and a half, in the Bay of Biscay, and the dredge brought up well-developed representatives of all the classes of marine invertebrates. During the cruises of the "Porcupine" the fauna of the deep water off the western coasts of Great Britain and of Spain and Portugal was tolerably well ascertained, and it was found to differ greatly from the fauna of shallow water in the same region. to possess very special characters, and to show a very marked relation to the fauna of the earlier Tertiary and the later Cretaceous periods.

In the winter of 1872, as a sequel to the preliminary cruises of the "Lightning" and "Porcupine," by far the most considerable expedition in which systematic dredging had ever been made a special object left Great Britain. H.M.S. "Challenger," a corvette of 2306 tons, with auxiliary steam working to 1234 horse-power, was despatched to investigate the physical and biological conditions of the great ocean basins.

The "Challenger" was provided with a most complete and liberal organization for the purpose; she had powerful deck engines for hauling in the dredge, workrooms, laboratories, and libraries for investigating the results on the spot, and a staff of competent naturalists to undertake such investigations and to superintend the packing and preservation of the specimens reserved for future study.

In these deep-sea dredgings it was frequently found that, while few objects of interest were brought up within the dredge, many echinoderms, corals, and sponges came to the surface sticking to the outside of the dredge, and even to the first few fathoms of the dredge-line. This suggested many expedients, and finally a long transverse iron bar was attached to the bottom of the dredge-bag, and large bunches of teased-out hemp were fastened to the free ends of the bar (fig. 4). The "hempen-tangles" are now regarded as an essential part of the dredge, nearly as important as the dredge-bag, and often much more conspicuous in its results. This addition to Ball's dredge is not, however, generally available in dredging from a boat or in shallow water; the tangles are apt to catch on rocks or coral, and a turn of the drum of the donkey-engine is required to free them.

Ball's dredge was still employed, with some slight modifications, the result of further experience. Fig. 4 represents the form of dredge which was found most suitable for great depths. The dredge-frame of hammered iron is 4 feet 6 inches long and 1 foot 3 inches broad; the scrapers are 3 inches wide, and are connected at the ends by bars of $1\frac{1}{4}$ inches round iron. The arms are of inch

FIG. 4.—Deep-sea Dredge, with Tangle-bar.

round iron, and slightly curved; they are bolted together to a stout iron bar which ends above in a swivel and ring. Two bars of square iron of some strength are attached by eyes to the round cross-bars at the ends of the dredge-frame, and have the other ends lashed to the iron bar which bears the tangles. These rods keep the dredge-bag at its full length, and prevent it or the tangles from folding over the mouth of the dredge. The dredge-bag is 4 feet 6 inches in length; the lower half is of twine netting so close as to retain everything except the finest mud, which indeed only partially washes through, and the upper half is of twine netting with the meshes an inch to the side. The bag is guarded by three loops of bolt-rope attached to the frame of the dredge, to the bottom of the bag, and finally to the tangle-bar. The canvas pads represented in the figure on the dredge-frame are only to protect the seizings of the loops. The dredge is suspended by an iron chain, which forms the first few fathoms of the dredge-line. The chain is not, however, directly fastened to the ring at the end of the arms, but is made fast to one of the end bars of the dredge-frame, and it is stopped to the ring by a single strand of bolt-rope. If the dredge get caught the stop carries away, the direction of the strain on the dredge is altered, and it probably relieves itself and comes up end upwards. In deep water a 28 lb deep-sea lead is usually hung from the centre of the tangle-bar with four tangles on each side.

Dredging was carried on in the "Challenger" from the main yard-arm. A strong pendant was attached by a hook to the cap of the main-mast, and by a tackle to the yard-arm a compound arrangement of 55 to 70 of Hodge's patent accumulators was hung to the pendant, and beneath

it a block through which the dredge-rope passed. The donkey-engines for hauling in the dredging and sounding gear were placed at the foot of the main-mast on the port side. They consisted of a pair of direct-acting, high-pressure, horizontal engines, in combination of 18 horsepower nominal. Instead of a connecting rod to each, a guide was fixed to the end of the piston-rod with a brass block working up and down the slot of the guide. The crank-axes ran through the centre of the blocks, and the movable block, obtaining a backward and forward motion from the piston-rod, acted on the crank as a connecting-rod would do. This style of engine is commonly used for pumping, the pump-rods being attached to the guide on the opposite side from the piston-rod. At one end of the crank a small toothed wheel was attached, which drove one thrice the multiple on a horizontal shaft extending nearly across the deck, and about 3 feet 6 inches above it. At each end of this shaft a large and a small drum were fixed, the larger having three sheaves cast upon it of different sizes, the lesser being a common barrel only. To these drums the line was led, two or three turns being taken round the drum selected. In hauling in, the dredge-rope was taken to a gin-block secured to a spar on the fore-castle, then aft to the drum of the donkey-engines on the port side, then to a leading-block on the port side of the quarter-deck, and across the deck to a leading-block on the starboard side corresponding in diameter with the drum used on the port side, and from this it was finally taken by the hands and coiled. The strain is of course greatest at the yard-arm and the first leading-block, and by this arrangement it is gradually diminished as the line passes round the series of blocks and sheaves.

A change made latterly in the handling of the dredge had certain advantages. Instead of attaching the weights directly to the dredge-rope, and sending them down with the dredge, a "toggle," a small spindle-shaped piece of hard wood, was attached transversely to the rope at the required distance, 200 to 300 fathoms in advance of the dredge. A "messenger," consisting of a figure of eight of rope, with two large thimbles in the loops, had one of the thimbles slipped over the chain before the dredge was hung, and the other thimble made fast to a lizard. When the dredge was well down and had taken its direction from the drift of the ship, the weights, usually six 28-lb deep-sea leads in three canvas covers, were attached to the other thimble of the traveller, which was then cut adrift from the lizard and allowed to spin down the line until it was brought up by the toggle. By this plan the dredge took a somewhat longer time to go down; but after it was adopted not a single case occurred of the fouling of the dredge in the dredge-rope, a misadventure which had occurred more than once before, and which was attributed to the weights getting ahead of the dredge in going down, and pulling it down upon them entangled in the double part of the line.

The great risk in dredging in very deep water is that of the dredge running down nearly vertically and sinking at once into the soft mud, and remaining imbedded until hauling in commences. During the earlier part of the voyage of the "Challenger" this accident seemed too often to defeat, at all events partially, the object of the operation; and, after various suggestions for modifying the dredge, it was proposed to try some form of the trawl in order to insure, so far as possible, the capture of any of the larger marine animals which might be present, and thus to gain a better general idea of the nature of the fauna. A 15-foot beam-trawl was sent down off Cape St Vincent to a depth of 600 fathoms; the experiment looked hazardous, but the trawl came up in due time all right, and contained, along with many of the larger Invertebrata, several fishes. The

trawl seemed to answer so well that it was tried again a little farther south in 1090 fathoms, and again it was perfectly successful, and during the remainder of the voyage it was employed almost as frequently, and in nearly as deep water, as Ball's dredge. The deepest successful haul of the trawl was in the Pacific in 3125 fathoms, and the deepest haul of Ball's dredge was in the Atlantic at 3150 fathoms.

During the voyage of the "Challenger" a course of about 70,000 nautical miles was traversed in three years and a half, and 362 observing stations were established at intervals as nearly uniform as circumstances would permit; and at the greater number of these dredging or some modification of the process was successfully performed—52 times at depths greater than 2000 fathoms, and thrice at depths beyond 3000 fathoms. So fully convinced were the "Challenger" officers that they could dredge at any depths, that it was only want of time and daylight which prevented their doing so at their deepest sounding, 4575 fathoms. The Atlantic was crossed five times, and an erratic route through the Pacific gave a good idea of the conditions of the abysses of that ocean, while in the South Indian Ocean dredging and trawling were carried down close to the Antarctic ice-barrier.

The expedition was successful, and the results were of the most interesting nature. Animal life was found to exist at all depths, although probably in diminishing abundance as the depth becomes extreme; and in all parts of the world at depths beyond 400 or 500 fathoms the fauna had much the same general character. The species usually differed in widely separated areas, but the great majority of forms, if not identical, were so nearly allied that they might be regarded as representative and genetically related. Although all marine invertebrate classes were represented, echinoderms in their different orders, sponges, and Crustacea preponderated, while corals and Mollusca were comparatively scarce. In the first two groups named many forms occurred allied to families which had been previously regarded as extinct or nearly so; thus among the echinoderms, stalked crinoids were by no means rare, and many species of regular Echinidea related to the Chalk genus *Echinothuria*, and many irregular species allied to *Ananchytes* and *Dysaster* occurred. The sponges were mainly represented by the *Hexactinellida*, the beautiful order to which the glass-rope sponge of Japan and the marvellous "Venus's Flower Basket" of the Philippines belong, the order to which the *Ventriculites* of the Chalk must also be referred.

Dredging at these great depths is a difficult and critical operation, and, although by its means some idea of the nature and distribution of the abyssal fauna of the ocean has already been attained, it will be long before the blanks are filled up; for of the area of 140,000,000 square miles forming the "abyssal province," the actual amount hitherto traversed by the naturalist's dredge may still be readily reckoned by the square yard. (C. W. T.)

DREDGING. Dredging is the name given by engineers to the process of excavating materials under water, raising them to the surface, and depositing them in barges. It is a process which has been useful from very early times in works of marine and hydraulic engineering, and it has of late years, by improved appliances, been brought to high perfection.

Bag and Spoon Dredge.—The first employment of machinery to effect this object is, like the discovery of the canal lock, claimed alike for Holland and Italy, in both of which countries dredging is believed to have been practised before it was introduced into Britain. The Dutch at a very early period used what is termed the "bag and spoon" dredge for cleaning their canals. It was

simply a ring of iron, about 2 feet in diameter, flattened and steeled for about one-third of its circumference, having a bag of strong leather attached to it by leathern thongs. The ring and bag were fixed to a pole, which, on being used, was lowered to the bottom from the side of a barge moored in the canal or river. A rope made fast to the iron ring was then wound up by a windlass placed at the other end of the barge, and the spoon was thus dragged along the bottom, and was guided in its progress by a man who held the pole. When the spoon reached the end of the barge where the windlass was placed, the winding was still continued, and the suspending rope being nearly perpendicular, the bag was raised to the surface, bringing with it the stuff excavated while it was being drawn along the bottom. The windlass being still wrought, the whole was raised to the gunwale of the barge, and the bag, being emptied, was again hauled back to the opposite end of the barge, and lowered for another supply. This system is slow, and only adapted to a limited depth of water and a soft bottom. But it has been generally employed in canals, and is much used in the Thames. The writer had occasion to use it at the Fosdyke Canal, in Lincolnshire, where 135,000 tons were raised in the manner described.

Dredging by Bucket between two Lighters.—Another plan, practised at an early period in rivers of considerable breadth, was to moor two large barges, one on each side; between them was slung an iron dredging bucket, which was attached to both barges by chains wound round the barrels of a crab winch worked by six men in one barge, and round a simple windlass, worked by two men in the other. The bucket, being lowered at the side of the barge carrying the windlass, was drawn across the bottom of the river by the crab winch on the other barge; and, having been raised and emptied, it was hauled across by the opposite windlass for a repetition of the process. This plan was in use in the Tay till 1833.

Steam Dredges.—In all large operations these and other primitive appliances have now, as is well known, been superseded by the steam dredge, which was first employed, it is believed, in deepening the Wear at Sunderland about the year 1796. The Sunderland machine was made for Mr Grimshaw by Boulton and Watt. Receiving improvements from Mr Hughes, Mr Rennie, Mr Jessop, and others, the steam dredge, as now generally constructed, is a most powerful machine in skilful hands, excavating and raising materials from depths of 15 to upwards of 30 feet of water according to the size of the machinery, at a cost not very different from, and in some cases even less than, that at which the same work could be performed on dry land.

As to the kind of work that may be accomplished by dredging, it may be stated that almost all materials, excepting solid rock or very large boulders, may now be dredged with ease. Loose gravel is probably the most favourable material to work in; but a powerful dredge will readily break up and raise indurated beds of gravel, clay, and boulders, and even find its way through the surface of soft rock, though it will not penetrate very far into it. In such cases it is usual to alternate on the bucket-frame a bucket for raising the stuff, with a rake or pronged instrument for disturbing the bottom. The writer in his own experience has raised boulders weighing upwards of a ton with a powerful dredge of the ordinary construction, and removed disintegrated or rotten rock at least to a limited depth, and he believes that in many cases the surfaces of submerged rocks may, by means of such appliances, be to some extent broken up and removed, so as to obtain in certain situations a considerable increase of depth, without recourse to cofferdams, which involve great expense.

The construction of large river steam dredges is now carried on by many engineering firms. The main feature

of the machine is the bucket-ladder, which is lowered through an ark formed in the vessel till it reaches the bottom. Along this ladder a series of buckets traverse which cut into the bottom at the lower extremity of the ladder and return loaded with the excavated material, which is discharged at the top of the bucket-ladder into a lighter or barge prepared for its reception. The machines are sometimes made with single and sometimes with double ladders, sometimes discharging at the stern of the vessel and sometimes at both sides, but it is obviously impossible to give illustrative drawings of the different forms of dredgers in sufficient detail to be practically useful. It may be stated that a first-class dredging machine to work in 30 feet water, and discharge over either side, of 60 horse-power complete, costs at present prices about £16,000 to £18,000. The steam hoppers employed to receive and remove the dredgings carry about 500 tons of excavations; they are 70 horse-power, and steam at about 9 miles per hour. The hopper barges are made with opening hinged bottoms, which can be opened when the place of deposit is reached, and the dredgings easily and quickly discharged. These steam barges cost about £8000. Large dredges, such as those constructed by Messrs Wingate of Glasgow for the Tyne and other places, will excavate at the rate of 460 tons per hour when working on favourable ground.

Hopper Dredge.—Some improvements that have been suggested on the dredging plant hitherto used deserve notice. Among these may be mentioned that of Messrs Simons & Company, Renfrew, who have patented and constructed what they have called a hopper-dredge, combining in itself the advantages of a dredge for raising the material and a screw hopper vessel for conveying it to the place of discharge, both which services are performed by the same engines and the same crew. Messrs Simons have constructed seven hopper dredges on this plan, varying from 200 to 1000 tons of "hopper capacity."

Silt Dredge.—Another of the recently suggested improvements is that by Mr C. Randolph, who, in 1879, proposed that, instead of the ordinary dredging buckets, pipes should be lowered until they come into contact with the sand or mud at the bottom. The tops of these pipes were to be in communication with powerful centrifugal pumps, so that the velocity of the in-flowing water through the pipes could be made so great as to carry with it a large percentage of the sand or mud from the bottom; and when the solid matter, and the water in which it is suspended, were raised to the desired height, they would flow freely to any required place for deposit of the suspended material. It is not known that this plan has been carried into practical operation.

Dredging at Amsterdam and Suez Canals.—Another arrangement is that of raising the material by buckets in the ordinary way, and thereafter receiving it in a vessel and floating it off by pipes to the place of deposit. This, of course, can only be done where the place of deposit is close to the spot whence the material is dredged. Two plans have been proposed for effecting this. One of these has been used in the Amsterdam Canal, where the stuff is discharged from the buckets into a vertical cylinder, and is there mingled with water by a revolving Woodford-pump and sent off under pressure to the place of deposit in a semi-fluid state. At the Amsterdam Canal this was done by pipes made of timber, and hooped with iron like barrels. These wooden cylinders were made in lengths of about 15 feet, connected with leather joints, and floated on the surface of the water, conveying the stuff to the requisite distance, like the hose of a fire engine, under a head of pressure, it is believed, of 4 or 5 feet, and depositing it over the banks of the canal. A somewhat similar process was employed

on the Suez Canal,—not, however, by using pumps, but simply by running the stuff to the banks on steeply inclined shoots, which were supplied with water when the material raised did not contain sufficient water to cause it to run freely. It is obvious, however, that these arrangements can only be applied in situations where the material to be excavated is of a very soft nature, and where the place of deposit is close at hand. In keeping clear the Suez Canal such appliances may be very useful, as the soft deposit of the canal has only to be raised and projected over the banks on either side.

American Dredges.—Dredging in Canada and the United States is done by what are called *Dipper* and *Clam-shell* dredges, the bucket dredge being seldom used.

The *dipper dredge* consists of a barge, with a derrick-crane reaching over the stern, suspending a large wrought-iron bucket which brings up the dredged material. To the bucket is attached a pole 6 inches by 4 inches in cross section, by which means it is guided while being drawn along the bottom; it is then raised, and its bottom being made to drop open, the contents fall into the barge moored alongside of the dredge. The bottom of the bucket is kept closed by a catch, which, by means of a rope, can be withdrawn at the proper moment. The *clam-shell* is a box made of two similar pieces of wrought iron hinged together at one end; by a simple arrangement of the gearing the clam, mouth open, drops down and sinks into the bottom, and the first effect of heaving up is to close it, thus imprisoning a quantity of material which is raised and deposited as in the case of the dipper. Both kinds of dredges are worked by a steam-engine, and rough as they appear to be, they are extensively employed in deepening and widening river channels, making or deepening canals, and other such works.

This is not the place to discuss the merits of different apparatus, which perhaps can only be settled by the actual performance of different arrangements when fully tested by practice. Having thus briefly noticed them, a few practical observations on dredging, as more immediately applicable to British rivers, have still to be mentioned.

Longitudinal and Cross Dredging.—In river dredging two systems are pursued. One plan consists in excavating a series of longitudinal furrows parallel to the axis of the stream, the other in dredging cross furrows from side to side of the river. It is found that inequalities are left between the longitudinal furrows when that system is practised, which do not occur, to the same extent, in side or *cross dredging*; and the writer invariably finds cross dredging to leave the most uniform bottom. To explain the difference between the two systems of dredging it may be stated that in either case the dredge is moored from the head and stern by chains about 250 fathoms in length. These chains in improved dredges are wound round windlasses worked by the engine, so that the vessel can be moved ahead or astern by simply throwing them into or out of gear. In longitudinal dredging the vessel is worked forward by the head chain, while the buckets are at the same time performing the excavation, so that a longitudinal trench is made in the bottom of the river. When the dredge has proceeded a certain length, it is stopped and permitted to drop down and commence a new longitudinal furrow, parallel to the first one. In cross-dredging, on the other hand, the vessel is supplied with two additional moorings, one on each side; and these chains are, like the head and stern chains, wound round barrels wrought by the engine. In commencing to work by cross dredging we may suppose the vessel to be at one side of the channel to be excavated. The bucket frame is set in motion, but, instead of the dredge being drawn forward by the head chain, she is

drawn to the opposite side of the river by the side chain, and, having reached the extent of her work in that direction, she is then drawn a few feet forward by the head chain, and, the bucket frame being still in motion, the vessel is hauled across by the opposite chains to the side whence she started. By means of this transverse motion of the dredge a series of cross furrows is made; she takes out the whole excavation from side to side as she goes on, and leaves no protuberances such as are found to exist between the furrows of longitudinal dredging, even where it is executed with great care. The two systems will be best explained by reference to fig. 1, where A and B are the head and stern moorings, and C and D the side moorings; the arc *ef* represents the course

FIG 1.

of the vessel in cross dredging, while in longitudinal dredging, as already explained, she is drawn forward towards A, and again dropped down to commence a new longitudinal furrow.

Blasting combined with Dredging.—In some cases, however, the bottom is found to be too hard to be dredged until it has been to some extent loosened and broken up. Thus at Newry, Mr Rennie, after blasting the bottom in a depth of from 6 to 8 feet at low water, removed the material by dredging at an expense of from 4s to 5s. per cubic yard. The same process was adopted by Messrs Stevenson at the bar of the Erne at Ballyshannon, where, in a situation exposed to a heavy sea, large quantities of boulder stones were blasted, and afterwards raised by a dredger worked by hand at a cost of 10s. 6d per cubic yard.

Sir William Cubitt also largely employed blasting in connection with dredging on the Severn, of which an instructive account is given in the *Minutes of Proceedings of the Institution of Civil Engineers*, from which the following particulars are taken:—

"It appears that a succession of marl beds, varying from 100 yards to half a mile in length, were found in the channel of the Severn, which proved too hard for being dredged, the whole quantity that could be raised being only 50 or 60 tons per day, while the machinery of the dredgers employed was constantly giving way. Attempts were first made to drive iron rods into the marl bed, and to break it up, a second attempt was made to loosen it by dragging across its surface an instrument like a strong plough. But these plans proving unsuccessful, it was determined to blast the whole surface to be operated on. The marl was very dense, its weight being 146 lb per cubic foot; and it was determined to drill perpendicular bores, 6 feet apart, to the depth of 2 feet below the level of the bottom to be dredged out. The bores were made in the following manner, from floating rafts moored in the river. Pipes of 1½ inch wrought iron, 3½ inches diameter, were driven a few inches into the marl. Through these pipes holes were bored, first with a 1½ inch jumper, and then with an auger. The holes were bored 2 feet below the proposed bottom of the dredging, as it was expected that each shot would dislocate or break in pieces a mass of marl of a conical form, of which the bore-hole would be the centre and its bottom the apex; so that the adjoining shots would leave between them a pyramidal piece of marl where the powder would have produced little or no effect. By carrying the shot holes lower than the intended dredging the apex only of the pyramid was left to be removed; and in practice this was found

* 1 Clay weighs about 109 lb, and sandstone about 155 lb per cubic foot.

to form but a small impediment. Fig. 2 is a section of the bore-holes, and fig. 3 a plan in which the inner dotted circles represent the diameters of the broken spaces at the level of the bottom

FIG. 2

of dredging. The cartridges were formed, in the ordinary way, with canvas, and fired with Bickford's fuse. The weights of powder used for bore-holes of 4 feet, 4 feet 6 inches, and 5 feet were respectively 2 lb, 3 lb, and 4 lb. The effect of the shot was generally to lift the pipes—which were secured by ropes to the

FIG. 3.

rafts—a few inches. Mr Edwards says that not one in a hundred shots missed fire, and these shots were generally saved by the following singular expedient—The pointed end of an iron bar, $\frac{1}{2}$ inch diameter, was made red hot, and, being put quickly through the water, and driven through the tamping as rapidly as possible, was, in nine cases out of ten, sufficiently hot to ignite the gun-powder and fire the shot.

The cost of each shot is calculated as follows—

Use of material	£0	1	0
Labour	0	3	3
Pitched bag for charge	0	0	3
8 lb of powder at 5½d.	0	1	4½
15 ft of patent fuse at ½ of a penny	0	0	9
Pitch, tallow, twine, coals, &c	0	0	4½

Cost per shot £0 7 0

Each shot loosened and prepared for dredging about four cubic yards, so that the cost of blasting was 1s 9d. per yard. The cost of dredging the material, after it had been thus prepared, was 2s. 8d., making the whole charge for removing the marl 4s. per cubic yard."

One of the most recent successful combinations of blasting and dredging was that completed in 1875 by Mr John Fowler of Stockton at the river Tees, to whom the writer is indebted for the following particulars. The chief novelty was in the barge upon which the machinery was fixed. It was 58 feet by 28 feet by 4 feet, and had eight legs which were let down when the barge was in position. The legs were then fixed to the barge, so that on the tide falling it became a fixed platform from which the drilling was done. The holes were bored and charged, and when the tide rose the legs were heaved up and the barge removed, after which the shots were discharged. There were 24 boring tubes on the barge, and that was the limit which

could at any time be done in one tide. The surface over which the blasting was done measured 500 yards in length by 200 yards in breadth, a small part of that surface being uncovered at low water. The depth obtained in mid-channel was 14 feet at low-water, the average depth of rock blasted being about 4 feet 6 inches. The holes, which were bored with the diamond drill, varied in depth from 7 to 9 feet, the distance between them being 10 feet. Dynamite in tin canisters fired by patent fuse was used as the explosive, the charges being 2 lb and under. The rock is Oolite shale of variable hardness, and the average time occupied in drilling 5-feet holes was twelve minutes.

The dredger raised the blasted rock,—the cost for blasting, lifting, and discharging at sea being about 4s. per cubic yard, including interest on dredging and other plant employed. The dredger sometimes worked a face of blasted material of from 7 to 8 feet. The quantity blasted was 110,000 cubic yards, and the contract for blasting so as to be lifted by the dredger was 3s. 1d. per cubic yard.

Dredging in Exposed Situations.—In some cases dredging has to be conducted in exposed situations such as the deepening of the "flats" at Londonderry and the bar at Carlingford. Messrs Stevenson found that dredging at the Foyle could not be conducted when the height of the waves exceeded 2½ feet; and Mr Barton at Dundalk so far confirms this, as he estimates a swell of 2 feet as the highest to work in.

Dredging on the River Clyde.—An important point connected with this subject is the cost at which dredging may be done when conducted on a large scale. This, of course, must depend on the character of the stuff to be raised and other circumstances; but the following information, kindly communicated by Mr James Deas, the engineer to the Trustees of the Clyde Navigation, cannot fail to be both interesting and useful.

Mr Deas says truly that the Clyde Trustees employ probably the largest dredging fleet of any trust in the kingdom, in maintaining and still deepening and widening the river to meet the ever-increasing demands of the shipping trade.

In the year 1871, for example, 904,104 cubic yards, or about 1,130,000 tons, were dredged from the river, of which 689,560 cubic yards were carried to sea by steam hopper barges, and 214,544 cubic yards deposited on land by means of punts. Of this 904,104 cubic yards, 345,209 cubic yards were deposit from the higher reaches of the river and its tributaries, and from the city sewers, and 558,895 cubic yards new material. The total cost for dredging and depositing was £35,448, or about 9.41 pence per cubic yard.

Owing to the difference in power of the dredging machines employed, and the character of the material lifted, the cost of dredging varies much. In 1871 the most powerful machine, working 2420 hours, lifted 430,240 cubic yards of silt and sand at a cost of 2.60 pence per yard, and this was deposited in Loch Long, 27 miles from Glasgow, by steam hopper barges, at 5.46 pence per yard. On the other hand, another dredger, working 2605 hours, lifted only 26,720 cubic yards of hard gravel and boulder clay, at the cost of 20.8 pence per cubic yard, which was deposited on the alveus of the river at the cost of 17.46 pence per cubic yard; another, working 1831½ hours, lifted 122,664 cubic yards of silt, sand, and sewage deposit, at the cost of 5.67 pence per cubic yard, which was deposited on land at the cost of 16.40 pence per cubic yard; and another, working 2233 hours, lifted 65,160 cubic yards of till, gravel, and sand, at the cost of 5.89 pence per cubic yard, which was deposited on the alveus of the river at the cost of 9.83 pence per cubic yard.

The total quantity dredged from the river during the twenty-seven years prior to 1872 amounts to 13,617,000

cubic yards, or upwards of 17,000,000 tons. The dredging plant of the Clyde Trust comprises—

- 6 steam dredges,
- 14 steam hopper barges,
- 1 steam-tug,
- 3 diving-bells,
- 270 punts, and numerous small boats.

The expenditure for wages of crews, coal, and stores amounted in the year 1871 to fully £14,000, and for repairs £10,775. The value of the dredging plant employed is about £140,000.

Mr Deas has also kindly furnished the following tables, from which the reader will see the gradual increase that has been made on the size of the dredging machines to meet the increased depth of water and growing necessity of increased accommodation for the larger class of vessels which now frequent the river.—

General Dimensions of Dredgers employed on the Clyde in 1872.

No	Year built	Length.	Breadth.	Depth.	11 ft.	Greatest depth can dredge in.	Single or double bucket ladder.	Remarks
1	1851	99 9	32 4	10 0	40	22 1/2	Double	Punt-loading Machine.
5	1841	95 6	22 6	10 4	24	18	Single	Do. Do.
6	1855	121 0	33 6	10 0	40	25	Double	Hopper Barge Do
7	1860	108 6	23 6	9 0	25	25	Single	Punt Do
8	1865	161 0	29 0	10 0	75	28	Do	Hopper Barge Do.
9	1871	161 0	29 0	10 0	75	30	Do	Do Do

The following are the details as regards the dredgers and barges employed on the Clyde:—

No. 8 Dredger.

Length, 161 ft
Breadth moulded, 29 ft.
Depth, 10 feet.
Engine, 75 horse power. Cylinder, 48 in. diameter. Stroke, 5 ft.
One bucket ladder, 90 ft. 9 in. between centres
Size of buckets, 3 ft. 3 in. x 2 ft. 5 in. x 1 ft. 11 in.
When working in sand, can lift 190 cubic yards per hour.
Greatest depth can dredge in, 28 feet.
Working draught, 6 to 7 feet.
Wages per day of 10 hours as under:—

Master.....	7s. 0d.
Mate.....	3 9
Engineer.....	6 8
Fireman.....	3 8
Assistant do and cook.....	3 4
Boat crabman.....	3 4
Stern crabman.....	3 4
Deck hands (3), each.....	3 2
" one at.....	3 0
Watchman.....	3 0
Coals.....	65 cwt.
Tallow.....	2 lb.
Oil (Lard).....	16 gills.
Waste.....	1 1/2 lb.

Steam Hopper Barge.

Length, 145 ft.
Breadth moulded, 25 ft.
Depth, 11 ft. 9 in.
Engines, 40 horse power.
Draught light (average), 5 ft. 6 in.
Draught loaded, 11 ft.
Speed, 8 to 9 miles per hour.
Capacity of hopper, 320 cubic yards, or say 400 tons
Average distance run, loaded, 20 miles.
Wages per day as under:—

Master.....	7s. 0d.
Mate.....	4 6
Engineer.....	5 10
Fireman.....	3 6
Deck hands (3), each.....	3 4
Coals per day of 10 hours.....	70 cwt.
Tallow.....	5 lb.
Oil.....	20 gills.
Waste.....	2 lb.

Quantity and cost of dredging done by No. 8 Dredger during year ending 30th June 1871:—

Wages.....	£678 0 0
Coals.....	371 18 3
Stores.....	182 7 1
Repairs.....	£1232 5 4
Interest and depreciation—cost of dredger, £17,633, at 10 per cent.....	1669 6 11
	£2901 12 3
	1765 6 0
	£4666 18 3

Time worked during year, 2419 1/2 engine hours.
Sand, silt, till, and gravel lifted, 430,240 cubic yards.

430 240
2419 1/2 hours = 177 80 cubic yards lifted per hour

£4666, 18s. 3d.
430,240 cubic yards = 2 60 pence cost per cubic yard lifted.

Quantity and cost of conveying and discharging the total dredgings lifted by Nos. 6 and 8 Dredgers during the year ending 30th June 1871.—

Wages, coals, and stores.....	£6,917 0 5
Repairs.....	3,215 7 9

Interest and depreciation—cost of 10 hopper barges, £51,510, at 10 per cent.....

£15,323 8s. 2d
673,240 cubic yards, total dredgings conveyed. } = 5 46 pence cost per cubic yard

Note—Four hopper barges are required to keep one dredger in constant work

Abstract of the Quantity and Cost per Cubic yard of Dredging and Depositing during the year ending 30th June 1871.

Dredger, etc.	Nature of stuff, and where dredged generally.	Total cubic yards lifted	Cubic yards lifted per engine-hour.	Pence per cubic yard					Total Cost
				Dredging.	Conveying and depositing by barges.	Towing punts to discharging ground.	Discharging dredgings from punts.	Punts, boats, &c., used.

Black, Edinb 1872, p. 126 (D S)

DRELINCOURT, CHARLES (1595–1669), an eminent minister of the French Calvinistic church, was born at Sedan on the 10th July 1595. He studied first at the university of his native town, and afterwards at Saumur under the celebrated Professor Mark Duncan. In June 1618 he undertook the charge of the French Protestant church at Langres, where his ministrations were highly appreciated. The church, however, failed to receive the necessary royal sanction, and early in 1620 Drelincourt

1 Contractor's price for discharging at Blythwood Park, including slip docks, and waggoning a distance of about 1/2 mile.

2 Discharging by Trustees' men on river banks near Erskine Ferry, by beaching punts and wheeling.

removed to Paris, where he was ordained minister of the church at Charenton. He was a popular and eloquent preacher, distinguished especially by his power of practically applying the words of Scripture. He was the author of a large number of works in devotional and polemical theology, several of which had great influence, and attained a very extensive circulation. His *Catechism* and his *Consolations against the Fear of Death* (*Consolations contre les frayeurs de la mort*) became well known in England by means of translations, which were very frequently reprinted. It has been said that Defoe wrote his fiction of Mrs Veal, who came from the other world to recommend the perusal of Drelincourt on death, for the express purpose of promoting the sale of an English translation of the work. His controversial works were very numerous. Directed entirely against Roman Catholicism, they did much to strengthen and consolidate the Protestant party in France. Drelincourt died on the 3d November 1669. In 1625 he had married the only daughter of a wealthy merchant, by whom he had a family of sixteen. Several of his sons were distinguished as theologians or physicians. The third, Charles, was professor of physic at the university of Leyden, and physician to the prince of Orange; the sixth, Peter, was ordained a priest in the Church of England, and became dean of Armagh.

DRESDEN, the capital of the kingdom of Saxony, is situated in a beautiful and richly cultivated valley on both sides of the Elbe, at an altitude of 402 feet above the level

Plan of Dresden.

of the Baltic, 72 miles E.S.E. of Leipsic, and 116 miles S.E. of Berlin, in $51^{\circ} 3' N.$ lat. and $13^{\circ} 44' E.$ long. It is approached on almost every side through avenues of trees, and the distance is bounded by gentle eminences covered with plantations and vineyards. On the left bank of the Elbe are the Altstadt, with three suburbs, and Friedrichstadt (separated from the Altstadt by the Weisseritz, a small affluent of the Elbe); on the right the Neustadt and Antonstadt. Two fine bridges connect the Altstadt and Neustadt,—one of them, the old bridge, erected 1727–31, being 1420 feet long, and having 16 arches. The other, built 1846–52, unites the railways on the right and left

banks. The streets of the Altstadt are narrow and somewhat gloomy, those of the Neustadt wider and more regular. In 1875 there were 196,378 inhabitants, of whom 138,306 were on the left bank, 58,072 on the right. The vast majority of the population belong to the Lutheran Church.

On account of its delightful situation, and the many objects of interest it contains, Dresden is often called "the German Florence," a name first applied to it by Herder. The most imposing of the churches is the church of Our Lady, built 1726–45, with a cupola 311 feet high. The Roman Catholic church, built 1737–56, contains a magnificent organ by Silbermann, a number of statues by Mattioli, and pictures by Raphael Mengs, Sylvestre, and other artists. The church of St Sophia, begun in the 14th century, completed in the 16th, and restored in 1864–69, the Cross Church, the Russian church, and the synagogue are also noteworthy buildings. The Royal Palace, rebuilt in 1534 by Duke George, surmounted by a tower 387 feet high, the highest in Dresden, is externally unattractive, but the interior is splendidly decorated. In the palace chapel are pictures by Rembrandt, Nicolas Poussin, Guido Reni, and Annibale Caracci. The Prince's Palace, built in 1715, has a fine chapel, in which are various works of Torelli; it has also a library of 20,000 volumes. The Zwinger, begun in 1711, and built in the Rococo style, forms an inclosure within which is a statue of King Frederick Augustus I. It was intended to be the vestibule to a palace, but now contains a number of collections of great value. Until 1846 it was open at the north side; but this space has since been occupied by the Museum, a beautiful building in the Renaissance style, the exterior of which is adorned by statues of Michelangelo, Raphael, Giotto, Dante, Goethe, and other artists and poets, by Rietschel and Hahnel. The Brühl Palace was built in 1737 by Count Brühl, the minister of Augustus II. Near it is the Brühl Terrace, approached by a grand flight of steps, on which are groups, by Schilling, representing Morning, Evening, Day, and Night. The terrace commands a charming view of the Elbe and the surrounding country, and is a favourite promenade. The Japanese Palace, in the Neustadt, built in 1715 as a summer residence for Augustus II., receives its name from certain Oriental figures with which it is decorated; it is also sometimes called the Augusteum. Connected with it is a public garden, from which, as from the Brühl Terrace, fine views are obtained. Among the remaining buildings of note may be named the guard-house, the arsenal, and the court theatre, an edifice in the Renaissance style, built since 1871 to replace the theatre burnt in 1869. In the Neustadt there is an equestrian statue of Augustus the Strong, erected in 1737. The public monuments of Dresden also include the Maurice Monument, a relief dedicated by the elector Augustus to the memory of his brother; a statue of Weber, the musical composer, by Rietschel; statues of King Frederick Augustus II. and Theodor Körner, by Hahnel; and the Rietschel monument, on the Brühl Terrace, by Schilling.

The chief pleasure-ground of Dresden is the Grosser Garten, in which there are a summer theatre, the Rietschel Museum, and a château containing the Museum of Antiquities. The latter is composed chiefly of objects removed from the churches in consequence of the Reformation. Near the château is the zoological garden, formed in 1860, and excellently arranged. A little to the south of Dresden, on the left bank of the Elbe, is the village Räcknitz, in which is Moreau's monument, erected on the spot where he was fatally wounded in 1813. The mountains of Saxon Switzerland are seen from this neighbourhood. On the right bank, the slopes of which are covered

with villas, there are several popular places of public resort.

Dresden owes a large part of its fame to its extensive artistic, literary, and scientific collections. Of these the most valuable is its splendid picture gallery, founded by Augustus I and increased by his successors at great cost. It is in the Museum, and contains about 2500 pictures, being especially rich in specimens of the Italian, Dutch, and Flemish schools. Among the Italian masters represented are Raphael, Titian, Correggio, Leonardo da Vinci, Paolo Veronese, Andrea del Sarto, Giulio Romano, Annibale Caracci, Guido Reni, and Carlo Dolci. Of the Flemish and Dutch schools there are paintings by Rubens, Vandyck, Rembrandt, and Ruysdael, Wouvermann, Dow, Teniers, Ostade, Potter, &c. The French school is represented, among others, by Poussin and Claude. The gem of the collection is Raphael's Madonna di San Sisto, for which a room is set apart. There is also a special room for the Madonna of the younger Holbein. Other paintings with which the name of the gallery is generally associated are Coreggio's La Notte and Mary Magdalene; Titian's Tribute Money and Venus; The Adoration and The Marriage in Cana, by Paolo Veronese; Andrea del Sarto's Abraham's Sacrifice; Rembrandt's Portrait of Himself with his Wife sitting on his Knee; The Judgment of Paris and The Boar Hunt, by Rubens; Vandyck's Charles I, his Queen, and their Children. In separate compartments there are a number of crayon portraits, most of them by Rosalba Carriera, and views of Dresden by Canaletto and other artists. Besides the picture gallery the Museum includes a magnificent collection of engravings and drawings. There are upwards of 350,000 specimens, arranged in twelve classes, so as to mark the great epochs in the history of art. A collection of casts, likewise in the Museum, is designed to display the progress of plastic art from the time of the Egyptians and Assyrians to modern ages. This collection was begun by Raphael Mengs, who secured casts of the most valuable antiques in Italy, some of which no longer exist.

The Japanese Palace contains a public library of more than 300,000 volumes, with about 3000 MSS and 20,000 maps. This library is especially rich in the ancient classics, and in works bearing on literary history and the history of Germany, Poland, and France. In the Japanese Palace there are also a valuable cabinet of coins and a collection of ancient works of art. A collection of porcelain, formerly in the Japanese Palace, but since 1876 in the "Museum Johanneum" (which once contained the picture gallery), is made up of specimens of Chinese, Japanese, East Indian, Sevres, and Meissen manufacture, carefully arranged in chronological order. There is in the same building an excellent Historical Museum, in which there are many interesting relics of past times, besides objects which cast light on the history of races and of manners. In the Green Vault of the Royal Palace, so called from the character of its original decorations, there is an unequalled collection of precious stones, pearls, and works of art in gold, silver, amber, and ivory. The objects, which are about 3000 in number, are arranged in eight rooms. They include the regalia of Augustus II as king of Poland; the electoral sword of Saxony; a group by Dinglinger, in gold and enamel, representing the court of the Grand Mogul Aurangzebe, and consisting of 132 figures upon a plate of silver 4 feet 4 inches square; the largest onyx known, 6½ inches by 2½ inches; a pearl representing the dwarf of Charles II. of Spain; and a green brilliant weighing 40 carats. Besides the Green Vault the Royal Palace has a gallery of arms, consisting of more than 2000 weapons of artistic or historical value. In the Zwinger are the Zoological and Mineralogical Museums, and a collection of instruments used in mathematical and physical science.

The two chief art institutions in Dresden are the Royal Academy of Arts, founded in 1764, and the Royal Choir. The Art Union, founded in 1828, which has a permanent exhibition in the Brühl Terrace, is a private body; and there are a good many other private art societies more or less distinguished. Dresden is also the seat of a number of well-known scientific associations. The educational institutions of the town are both numerous and of a high order, including a technical college with a staff (in 1876) of 39 professors and teachers, three gymnasia, two real schools of the first class, and many schools of different ranks for popular education. The Catholics and Jews have schools of their own; and there are two seminaries for the education of teachers. Dresden has several important hospitals, asylums, and other charitable institutions.

Among the chief branches of industry are manufactures in gold and silver, turnery, straw plait, scientific and musical instruments, paper-hangings, artificial flowers, and painters' canvas. There are several large breweries; a considerable corn trade is carried on; and there is an extensive traffic in books and objects of art. A number of steam-ship companies provide for the navigation of the Elbe.

Dresden, which is known to have existed in 1206, is of Slavonic origin. It became the capital of Henry the Illustrious, margrave of Meissen, in 1270, but belonged for some time after his death, first to Wenceslas of Bohemia, and next to the margrave of Brandenburg. Early in the fourteenth century it was restored to the margrave of Meissen. On the division of the territory in 1485, it fell to the Albertine line, which has since held it. Having been burned almost to the ground in 1491, it was rebuilt, and in the 16th century the fortifications were begun and gradually extended. John George II, in the 17th century, formed the Grosser Garten, and otherwise greatly improved the town; but it was in the first half of the 18th century, under Augustus I and Augustus II, who were kings of Poland as well as electors of Saxony, that Dresden assumed something like its present appearance. The Neustadt, which had been burned down in the 17th century, was founded anew by Augustus I, he also founded Friedrichstadt. The town suffered severely during the Seven Years' War, being bombarded in 1760. Some damage was also inflicted on it in 1813, when Napoleon made it the centre of his operations; one of the buttresses and two arches of the old bridge were then blown up. The dismantling of the fortifications had been begun by the French in 1810, and was gradually completed after 1817, the space occupied by them being appropriated to gardens and promenades. Many buildings were completed or founded by King Anton, from whom Antonstadt derives its name. Dresden again suffered severely during the revolution of 1849, but all traces of the disturbances which then took place were soon effaced. In 1866 it was occupied by the Prussians, who did not finally evacuate it until the spring of the following year. Since that time numerous improvements have been carried out, and between 1871 and 1875 the population increased at the rate of rather more than 11 per cent. (J. SI.)

DREUX (*Durocassis*, *Drocca*), a town of France in the department of Eure-et-Loir, on the Blaise, 21 miles north of Chartres. Noteworthy structures are the Gothic church of St Pierre; the town-house, partly in the Gothic and partly in the Renaissance style, built in the 16th century, and the remains of a castle of the 12th century, situated on the hill overlooking the town, within the inclosure of which is a chapel commenced in 1816 by the dowager duchess of Orleans, and completed and adorned at great cost by Louis Philippe. The chief industries of Dreux are dyeing and silk-weaving, and the manufacture of jewellery, serges, hosiery, candles, hats, and leather. In 1872 the population of the commune was 7418, of the town 6666.

Dreux was governed by counts in the Middle Ages. In 1188 it was taken and burnt by the English; and in 1562 Coligni and the prince of Condé were defeated in its vicinity by Montmorency. In 1593 Henry IV captured the town after a fortnight's siege. Dreux was occupied by the Germans on October 9th, 1870, was subsequently evacuated, and was again taken, on November 17th, by General Von Tresckow.

DREW, SAMUEL (1765–1833), theologian, was born in the parish of St Austell, in Cornwall, March 3, 1765. His

father was a poor farm-labourer, and could not afford to send him to school long enough even to learn to read and write. At the age of seven he lost his mother, a woman of superior mind and religious character; and he was then sent to work with the tanners. At ten he was apprenticed to a shoemaker, and at twenty he settled in the town of St Austell, first as manager for a shoemaker; and about three years later he began business on his own account. He had already gained a reputation in his narrow circle as a keen debater and a jovial companion. He was first aroused to serious thought by the preaching of Adam Clarke; and the impression thus produced was deepened by the death of his elder brother. He now joined the Methodists, was soon employed as a class leader and local preacher, and continued to preach till a few months before his death. His opportunities of gaining knowledge were very scanty, but he strenuously set himself to make the most of them. It is stated that an accidental introduction to Locke's great essay determined the ultimate direction of his studies. In 1798 the first part of Paine's *Age of Reason* was put into his hands, and in the following year he made his first appearance as an author by publishing his *Remarks* on that work. The book was favourably received, and was republished in 1820. Drew had begun to meditate a greater attempt before he wrote his *Remarks on Paine*; and the fruits of his laborious investigation were given to the world in the *Essay on the Immateriality and Immortality of the Soul*, in 1802. This work made him widely known, and for some time it held a high place in the judgment of the religious world as a powerful and conclusive argument on its subject. A fifth edition appeared in 1831. Drew continued to work at his trade till 1805, when he entered into an engagement which enabled him to devote himself entirely to literature. In 1809 he published his *Essay on the Identity and General Resurrection of the Human Body*, perhaps the most original of his works, which reached a second edition in 1822. In 1819 Drew removed to Liverpool, on being appointed editor of the *Imperial Magazine*, then newly established, and in 1821 to London, the business being then transferred to the capital. Here he filled the post of editor till his death, and had also the supervision of all works issued from the Caxton press. He was an unsuccessful competitor for a prize offered in 1811 for an essay on the existence and attributes of God. The work which he then wrote, and which in his own judgment was his best, was published in 1820, under the title of *An Attempt to demonstrate from Reason and Revelation the Necessary Existence, Essential Perfections, and Superintending Providence of an Eternal Being, who is the Creator, the Supporter, and the Governor of all Things* (2 vols 8vo). This procured him the degree of M.A. from the university of Aberdeen. Among Drew's lesser writings are a *Life of Dr Thomas Cole* (1817), a *History of Cornwall* (1824), and a work on the divinity of Christ (1813). He died at Helston, in Cornwall, March 29, 1833. A memoir of his life by his eldest son appeared in 1834.

DREYSE, JOHANN NICHOLAS VON (1787–1867), inventor of the needle-gun, was the son of a locksmith, and was born at Sommerda the 20th November 1787. He served his apprenticeship in the shop of his father, and from 1806 to 1809 followed his calling at Altenburg and Dresden. From 1809 to 1814 he was in Paris, where he succeeded in finding employment in the gun-factory of the Swiss officer Pauli, patronized by Napoleon I. Afterwards he returned to Sommerda, where, in partnership with Kronbiegel, he established a factory for the making of articles in iron by machine tools. In 1824 he patented a new percussion action for the gun, and continued thereafter to busy himself with experiments to improve in every way possible the process of shooting. In 1827 he invented

the needle-gun, but without the advantage of breech-loading; and in 1836, having been encouraged in his endeavours by the Prussian Government, he invented his first complete needle-gun. A gunnery was opened by him in 1841, which ultimately supplied weapons for the troops of all the German states, and before his death employed about 1500 persons. In 1864 he and his family had the rank of nobility conferred on them. He died 9th December 1867.

DRIFFIELD (or GREAT DRIFFIELD, to distinguish it from the neighbouring hamlet of Little Driffield), a market-town of England, in the east riding of Yorkshire, 28 miles to the east of York, and 196 miles from London by road. The town—consisting of one principal street, from which some smaller ones diverge—is agreeably situated at the foot of the Wolds, and is connected with the port of Hull by a navigable canal. It stands in the centre of a fertile agricultural district. An important corn and cattle market is held in the town every Thursday, and there are four large stock-fairs annually at Little Driffield. Besides the parish church, a fine old edifice in different styles, the principal public buildings in Great Driffield are the places of worship for Independents, Methodists, and Baptists, the corn exchange, the dispensary, the mechanics' institute, and the station of the Hull and Scarborough railway. Carpets, cotton, and chemical manure are manufactured in the town; and in the neighbourhood are numerous flour-mills and mills for bone-crushing. Population in 1871, 8364.

DROGHEDA, a seaport, market-town, and municipal and parliamentary borough of Ireland, in the province of Leinster, about 4 miles from the mouth of the Boyne, and 31½ miles north of Dublin by rail. Though situated on the borders of Louth and Meath, it belongs to neither, as the town and surrounding district constitute a county of a city, with an area of 9 square miles, or 5780 acres. It occupies both banks of the river; but the northern division is the larger of the two, and has received greater attention in modern times. The ancient fortifications, still extant in the beginning of the century, have almost completely disappeared; but of the four gateways, one named after St Lawrence remains comparatively perfect, and there are considerable ruins of another. Great improvements have been effected in the town since 1840, under the encouragement bestowed by Benjamin Whitworth, M.P., who built a town-hall at his own expense in 1865, and furnished half the funds necessary for the construction of the water-works which now supply 800,000 gals. daily. Among the public buildings are a mansion-house or mayoralty, with a suite of assembly rooms attached; the "Tholsel," a square building with a cupola; a corn-market, the old linen-hall, an infirmary, a workhouse, and a prison; five Protestant churches, five Roman Catholic chapels, three friaries, and four nunneries. St Peter's Chapel formerly served as the cathedral of the Roman Catholic archbishopric of Armagh; and in the abbey of the Dominican nuns there is still preserved the head of Oliver Plunkett, the archbishop who was executed at Tyburn in 1681 on an unfounded charge of treason. There was at one time an archiepiscopal palace in the town, built by Archbishop Hampton about 1620; and the Dominicans, the Franciscans, the Augustinians, the Carmelites, and the knights of St John had monastic establishments. Of the Dominican buildings there still exists the stately Magdalen tower; the Franciscan friary is a striking ruin; and there are traces more or less distinct of the Augustinian priory, the priory of St Lawrence, and the hospital of St Mary. At the head of the educational institutions is a classical school endowed by Erasmus Smith; and among the public charities are an almshouse for twenty-four aged widows, and a foundation providing houses and annuities for thirty-six clergymen's widows. There is also a blue-coat school, founded about

1727 for the education of freemen's sons. The present building was erected by T. P. Cairnes in 1870. The industrial establishments comprise a large cotton factory, erected by Mr Whitworth in 1864, four extensive saw-mills, three flax-mills, six flour-mills, eight tanneries, five salt-works, four soap works, two extensive breweries, two newspaper offices, chemical manure works, and a large engineering factory for the making of steam-engines, iron-bridges, &c. A brisk trade is carried on, especially with Liverpool (which is distant 133 miles due east), and with Glasgow. The harbour has been greatly improved by the commissioners, and vessels of 400 tons can discharge at the quays. In 1873, 707, with a burden of 115,673 tons, entered the port; and the harbour receipts in 1871 were £3627. The tide reaches 2½ miles above the town to Oldbridge; and barges of 50 tons burden can proceed 19 miles inland to Navan. The river is crossed by a bridge for ordinary traffic, and by a splendid railway viaduct. Assizes, quarter sessions, and petty sessions are held in the town; the parliamentary borough returns one member to Parliament; and the municipal borough is governed by a mayor, 6 aldermen, and 18 councillors. The population of the municipal borough (area, 454 acres) was 17,365 in 1831, 16,845 in 1851, 14,740 in 1861, and 13,510 in 1871. The whole population, with the exception of about 1100, are Roman Catholics. The inhabitants of the parliamentary burgh, which has an area of 5785 acres, numbers 16,165.

In the earliest notices the town of Drogheda is called Inver-Colpa or the Port of Colpa; the present name signifies "The Bridge over the Ford." In 1152 the place is mentioned as the seat of a synod convened by the papal legate, Cardinal Paparo; in 1224 it was chosen by Lucas de Netterville, archbishop of Armagh, for the foundation of a Dominican friary; and in 1228 the two divisions of the town received separate incorporation from Henry III. But there grew up a strong feeling of hostility between Drogheda *versus* Uriel, and Drogheda *versus* Midiam, in consequence of trading vessels landing their cargoes in the latter or southern town, to avoid the pontage duty levied in the former or northern town. At length, after much blood had been shed in the dispute, Philip Bennett, a monk residing in the town, succeeded by his eloquence, on the festival of Corpus Christi, 1412, in persuading the authorities of the two corporations to send to Henry IV. for a new charter sanctioning their combination.

Drogheda has always been considered by the English a place of much importance. In the reign of Edward III. it was classed along with Dublin, Waterford, and Kilkenny, as one of the four staple towns of Ireland. Richard II. received in its Dominican monastery the submissions of O'Neal, O'Donnell, and other chieftains of Ulster and Leinster. The right of coining money was bestowed on the town, and parliaments were several times held within its walls. In the reign of Edward IV. the mayor received a sword of state, and an annuity of £20, in recognition of the services rendered by the inhabitants at Malpas Bridge against O'Reilly; the still greater honour of having a university with the same privileges as that of Oxford remained a mere paper distinction, owing to the poverty of the town and the unsettled state of the country; and an attempt made by the corporation in modern times to resuscitate their rights proved unsuccessful. In 1495 Poyning's laws were enacted by a parliament held in the town. In the civil wars of 1641 the place was besieged by O'Neal and the Northern Irish forces; but it was gallantly defended by Sir Henry Tichbourne, and after a long blockade was relieved by the Marquis of Ormond. The same nobleman relieved it a second time, when it was invested by the Parliamentary army under Colonel Jones. In 1649 it was captured by Cromwell, after a short though spirited defence; and nearly every individual within its walls, without distinction of age or sex, was put to the sword. Thirty only escaped, who were afterwards transported as slaves to Barbados. In 1690 it was garrisoned by King James's army; but after the decisive battle of the Boyne,—the site of which, about 2½ miles to the west, is marked by an obelisk 150 high,—it surrendered to the conqueror without a struggle, in consequence of a threat that quarter would not be granted if the town were taken by storm. Its subsequent history is purely of local interest.

DROHOBYCZ, a town of Austria, in the Galician circle of Sambor, on the Tysminika, a right-hand affluent of the Dniester, at the junction of a branch line from Boryslaw with the main Galician railway. It possesses a castle, a

beautiful Roman Catholic church, a synagogue, and a German high school; and its inhabitants, who number upwards of 12,000, deal in cattle, grain, earthenware, leather, and salt,—the last being obtained from the local brine wells.

DROITWICH, a municipal and a parliamentary borough of England, in Worcestershire, on the Salwarpe, a left-hand tributary of the Severn, about seven miles by rail N.N.E. of Worcester. With the exception of its modern extensions, the town is built in a straggling and irregular fashion; but it numbers among its public edifices a court-chamber and market-house, two churches—St Andrew's and St Peter's—several chapels, and a hospital established by Lord Keeper Coventry, the revenues of which maintain about forty men and women, and educate about 100 young persons of both sexes. The principal occupation is the manufacture of the salt obtained from the brine springs, or *wyches*, to which the town probably owes both its name and its origin; and the annual quantity obtained is about 116,000 tons. These springs were known to the Romans, who had a station on the spot, as was shown by the remains of a villa, with some interesting and valuable relics, discovered during the formation of the Oxford and Wolverhampton railway. In Domesday-book mention is made of a tax levied on the salt, which must consequently have been manufactured in the 11th century. A charter was bestowed on Droitwich by King John. The population of the municipal borough, with its area of 1849 acres, was 3504 in 1871; that of the parliamentary borough, with its area of 27,577 acres, was 9510.

DRÔME, a department in the south-east of France, formed of parts of Dauphiné and Provence, is bounded W. by the Rhone, which separates it from Ardèche, N. and N.E. by Isère, E. by Hautes-Alpes, S.E. by Basses-Alpes, and S. by Vaucluse, and lies between 44° 8' and 45° 20' 25" N lat. and 4° 41' and 5° 55' E long. To the east it is covered by spurs of the maritime Alps, one of the largest of which forms part of its eastern boundary, and throws off ridges, mostly wooded, that run east and west with tolerable regularity. These ridges divide the department in its whole extent into three great valleys, having a general slope westwards to the Rhone, namely, that of the Isère in the north, that of the Drôme, which occupies the central portion of the province, and that of the Aygues, in the south. The Rhone and Isère are both navigable. The former receives the whole of the drainage of the department. The soil consists of clays and argillaceous sand with rolled pebbles. Irrigation canals are numerous, and are skilfully managed. The climate, except in the valleys bordering the Rhone, is rather cold, but on the whole bracing and healthy. Snow is visible on the mountain-tops during the greater part of the year. The principal forest-trees are the pine, beech, and oak. In the valleys flourish the olive, chestnut, vine, almond, mulberry, nut, and other fruit trees, and wheat and madder are grown. Black truffles are abundant. Besides agriculture the principal industries are the rearing of silk-worms and sheep, and the manufacture of wines, the best of which are the red and white Ermitage, of woollen, cotton, and dyed linen goods, spun and woven silk, paper, oil, ropes, earthenware, and leather. The wool and wood trades are considerable. The mineral products include iron, copper, lead, lignite, marble, granite, black and red potter's clay, millstones, chalk, and cement-stone. Drôme is divided into the arrondissements of Valence, Die, Montclimart, and Nyons, comprising 29 cantons and 366 communes. The capital is Valence. Of the total area of 652,155 hectares (1,610,823 acres) about 514,227 acres are arable, 415,866 under wood, 329,961 heath. 58,430 vineyards, and 49,203 meadow. The population in 1872 was 320,417.

DROMEDARY. See CAMEL, vol. iv. p. 737.

DROPSY (contracted from the old word *hydropisy*, from the Greek ὕδωρ—*hōp*, water, and ὥψ, the appearance) signifies a collection of simple serous fluid in all or any of the cavities of the body, or in the meshes of its tissues. Dropsy of the subcutaneous connective tissue is termed *œdema* when it is localized and limited in extent; when more diffuse it is termed *anasarca*; the term *œdema* is also applied to dropsies of some of the internal organs, notably to that of the lungs. *Hydrocephalus* signifies an accumulation of fluid within the ventricles of the brain or in the arachnoid cavity; *hydrothorax*, a collection of fluid in one or both pleural cavities; *hydropericardium*, in the pericardium; *ascites*, in the peritoneum; and, when *anasarca* is conjoined with the accumulation of fluid in one or more of the serous cavities, the dropsy is said to be general.

Dropsy is essentially a symptom and not a specific disease, and ought not to be confounded with inflammatory exudations of a serous character. The transudation is a mere filtrate from the blood produced by increased intravascular pressure, of local or general origin, and occurring through the walls of the capillaries or smaller venules. Its specific gravity varies from 1·008 to 1·014; it is alkaline, occasionally neutral, very rarely feebly acid; it is not the liquor sanguinis, but merely water holding in solution a varying proportion of the constituents of the blood serum, chiefly the saline constituents, and of these notably the chloride of sodium, occasionally urea, sometimes cholestrine, always more or less albumen, and a proportionate amount of fibrogenous matter. It may be colourless, greenish or reddish from the presence of blood pigment, or yellowish from the presence of bile pigment; transparent, or opalescent, or milky from the presence of fatty matter derived from the chyle. The membrane from which the dropsical fluid escapes is healthy, or at least not inflamed, and only somewhat sodden by long contact with the fluid—the morbid condition on which the transudation depends lying elsewhere. The occurrence of dropsy is favoured by a watery condition of the blood due to imperfect nutrition, the pre-occurrence of acute disease, or the long continuance of exhausting discharges, as of albumen in Bright's disease, &c. This watery condition of the blood not only predisposes to dropsy, but also lends active aid in producing it by enfeebling the heart and thus disturbing the relations of the intravascular pressure. The active agents in the production of dropsy are whatever increases the intravenous blood pressure locally or generally. Obstruction to the centripetal venous current by thrombosis of the veins, by the pressure of hyperplastic connective tissue, as in hepatic cirrhosis, by the pressure of tumours either pathological, as aneurisms, cancerous or tubercular masses, or physiological, as a gravid uterus or a mass of fæces, or by the mere weight of the body in certain positions, as the sedentary, are efficient causes in the production of local dropsies. These are also more rarely brought about by thrombosis, or compression of the lymphatics, or of the thoracic duct, and this partly directly and partly indirectly by acting on the venous blood stream. The active agents in the production of general dropsy are diseases of the heart, the lungs, and the kidneys. The natural tendency of all diseases of the heart is to transfer the blood pressure from the arteries to the veins, and, so soon as this has reached a sufficient degree, dropsy in the form of local *œdema* commences to appear at whatever may be the most depending part of the body—the instep and ankle in the upright position, the lower part of the back or the lungs if the patient be in bed—and this tends gradually to increase till all the cavities of the body are invaded by the serous accumulation. The diseases of the lungs which produce dropsy are those which obstruct the passage of the blood through them, such as emphysema and bronchitis, and thus act precisely like

disease of the heart in transferring the blood pressure from the arteries to the veins, inducing dropsy in exactly a similar manner. The diseases of the kidney which give rise to dropsy are those in which there is more or less obstruction to the secretion of the watery and saline constituents of the urine, accompanied by a more or less free escape of albumen; these are the acute congestive form of nephritis following scarlet fever, the inflammatory or intratubular form of chronic Bright's disease, and the final stage of amyloid degeneration. In the two former the dropsy is often very considerable, and in the absence of cardiac disease will be found to appear first about the loose cellular tissues surrounding the eyes, where the vessels, turgid with watery blood, have less efficient support. Dropsy, though often a terminal and always a serious symptom, is yet one which much can be done to ameliorate and in many cases to remove, and this is particularly the case in many local dropsies and in those of cardiac origin. Lung, kidney, and hepatic dropsies are less amenable to treatment; yet one case of ascites is on record in which a perfect recovery took place after the woman had been tapped 133 times, and nearly 400 gallons of fluid removed. Diuretics and purgatives are the remedies chiefly employed; but in certain cases diaphoretics and especially the use of a hot air bath are very effectual, and in a large number paracentesis or tapping is either indispensable, or at all events much expedites the cure.

It may be well to mention that there are certain affections which may be termed *spurious dropsies*, such as *ovarian dropsy*, which is only a cystic disease of the ovary; *hydrometria*, dropsy of the uterus, due to inflammatory occlusion of the os uteri; *hydronephrosis*, dropsy of the kidney, due to obstruction of the ureter, and subsequent distention of these organs by serous accumulations; other hollow organs may also be similarly affected. (C. W. D.)

DROSTE-HÜLSHOFF, ANNETTE ELIZABETH, BARONESS or (1798–1848), a German poetess, was born on the estate of Hülshoff, near Münster, and belonged to the elder branch of the Catholic Westphalian family which about the same time had its reputation increased by the juridical labours of Clemens Augustus von Droste-Hülshoff. She received an education of a more scientific character than usually fell at that time to the lot of her sex; and the delicate state of her health obliged her to lead a very quiet and secluded life, which in its turn fostered the natural sensibility of her temperament, and increased her devotion to literature and study. With the exception of a short time spent at Cologne and Bonn about 1825, she mainly resided at her mother's country seat of Rischhaus, near Münster; but in 1841 she went to the castle of Eppishausen, in Thuringia, and in 1844 became a guest at the house of her brother-in-law Von Lassberg, on the borders of the Lake of Constance. She had just purchased an estate in that neighbourhood when she died in May 1848. Besides a volume of *Gedichte* published during her lifetime (Stuttgart, 1844), we have also from her pen *Das geistliche Jahr, nebst einem Anhang religiöser Gedichte*, Stuttgart, 1852; and *Letzte Gaben*, Hanover, 1860. The popularity of the first work is shown by a third edition in 1873. The characteristics of the author are great perfection of form, delicacy of feeling, and vivid realization of external nature. A number of her poems have been rendered into English by Medwin. See Schücking, *Annette von Droste-Hülshoff, Ein Lebensbild*, 1871.

DROUAIS, JEAN GERMAIN (1763–1788), a French historical painter, was born at Paris on the 25th November 1763. His father, Henri Drouais, and his grandfather, Hubert Drouais, were well-known portrait painters; and it was from his father that he received his first artistic instruction. He was afterwards intrusted to the care of Brenet, an excellent teacher, though his own pictures did not take

high rank. In 1780 David, who had just returned from Rome, opened a school of painting in Paris, and Drouais was one of his earliest and most promising pupils. He adopted the classical style of his master, and gave his whole time to study,—painting during the day, and spending a great part of every night in designing. For weeks together it is said that he never left his studio. In 1783 he was admitted to compete for the great prize of painting offered by the Academy, the subject being the Widow of Nain. After inspecting the works of his fellow-competitors, however, he lost hope and destroyed his own canvas, but was consoled by the assurance of his master David that had he not done so he would have won the prize. Next year he was triumphantly successful, the picture of the Woman of Canaan at the Feet of Christ, with which he gained the prize, being judged by competent critics to be worthy of comparison with the works of Poussin. He was carried shoulder high by his fellow-students through the streets to his mother's house, and a place was afterwards found for his picture in the Louvre. His success making him only the more eager to perfect himself in his art, he accompanied David to Rome, where he worked even more assiduously than in Paris. He was most strongly influenced by the remains of ancient art and by the works of Raphael. Goethe, who was at Rome at the time it was finished, has recorded the deep impression made by his picture of Marius at Minturno, which he characterizes as in some respects superior to the work of David, his master. The last picture which he completed was his Philoctetus on the Island of Lemnos. He died of fever on the 15th July 1788. A monument to his memory was erected by his fellow-students in the church of Santa Maria in the Via Lata.

DROUET, JEAN BAPTISTE (1763–1824), one of the Terrorists of the first French Revolution, chiefly noted for the part he played in the arrest of Louis XVI. at Varennes, was born at Sainte-Menehould in 1763. He served for seven years in the army, and afterwards assisted his father, who was post-master of his native town. The carriages conveying the royal family on their flight to the frontier stopped at his door on the evening of June 21, 1791; and the passengers, travelling under assumed names, were recognized by Drouet, who immediately took steps which led to their arrest and detection on reaching Varennes. For this service the Assembly awarded him 30,000 francs, but he appears to have declined the reward. In September 1792 he was elected deputy to the Convention, and took his place with the most violent party. He voted the death of the king without appeal, showed implacable hostility to the Girondins, and proposed the slaughter of all English residents in France. Sent as commissioner to the army of the north, he was captured at the siege of Maubeuge and imprisoned at Spielberg till the close of 1795. He then became a member of the Council of Five Hundred, and was named secretary. Drouet was implicated in the conspiracy of Babeuf, and was imprisoned; but he made his escape into Switzerland, and thence to Teneriffe. There he took part in the successful resistance to the attempt of Nelson on the island, in 1797. The first empire found in him a docile sub-prefect of Sainte-Menehould. After the second Restoration he was compelled to quit France. Returning secretly he settled at Macon, under a false name and a guise of piety, and preserved his incognito till his death, which took place in that town April 11, 1824.

DROUET D'ERLON, JEAN BAPTISTE (1765–1844), count, marshal of France, and governor of Algeria, was born at Rheims, July 29, 1765. He entered the army in 1782, was discharged after five years' service, re-entered it in 1792, and two years later became aide-de-camp to General Lefèvre. He served at the sieges of Valenciennes, Quesnoy, and Condé, and under Hoche at the blockade of

Ehrenbreitstein. As general of brigade (1799) he fought at Zurich, at the bridge of Schaffhausen, and at the taking of Constance. In August 1800 he was promoted general of division. He distinguished himself at Ulm and Hohenlinden, and by a skilful manoeuvre decided the victory of Jena (1806). Drouet took a brilliant part in the siege of Dantzic, and signed the capitulation of the town; he fought at Mohrungen, and was severely wounded at Friedland (1807). After this battle he was made grand officer of the Legion of Honour, was created Count d'Erlon, and received a pension. He afterwards served with distinction in the Peninsular War, and defeated General Hill at the Col de Maya. After the first Restoration he was named commander of the 16th military division. He presided at the council of war, at Lille, which acquitted General Excellmans; but in March 1815 he was arrested on suspicion of treason, and suffered a short imprisonment. He was present under Napoleon at Waterloo, and was severely reproached by the emperor for not bringing his division into action. After the second Restoration he quitted France, and did not return till 1825. He was appointed governor of Algeria in 1834, was created marshal of France in 1843, and died at Paris January 25, 1844.

DROWNING is one of the various forms of death from suffocation, the asphyxiating agent being water, and, accordingly, all the appearances characteristic of death from asphyxia or apnoea are present,—varying in intensity according to the manner of the death, whether it has or has not been attended with violent struggling. In addition, owing to the medium in which the death occurs, certain other signs specially characteristic of drowning are never absent.

By older authors a peculiar form of death by drowning was described, in which the appearances of asphyxia were wanting, and also the special signs of this form of death. To this the name of syncopal asphyxia was given. Hence, in treating of drowning, descriptions of these two forms were given, and in the case of bodies recovered from the water death was said to have occurred either from asphyxia or from syncope. Now, undoubtedly it often happens when persons fall or are thrown into the water that, in consequence of fright or of the shock sustained by violent contact with the surface of the water, no effort is made to save themselves, and death rapidly ensues from syncope. In such cases none of the characteristic signs of drowning are found, and, so far as the examination of the body is concerned, it is impossible to decide upon the exact cause of death. It is quite within the bounds of possibility that in such cases death may have been effected by other means, and the body have been thrown into the water to conceal the true cause of death.

No such uncertainty, however, attends the investigation of a case of drowning by true asphyxia, as it was called. The drowned individual struggles to reach the surface of the water in his efforts to respire, as he does so he draws water into his windpipe which provokes cough. This expels the air from his lungs, and the water which threatened to suffocate him; and as he sinks, in his struggles he endeavours again to respire, but now draws water into his mouth which chokes him, and can only be got rid of by swallowing. Insensibility then comes on, and death rapidly but placidly ensues from a true asphyxia.

If the body be recovered—say within two hours—it is relaxed, and generally presents a pallid appearance. The face is slightly congested, the features placid and composed. The lips are livid, and the tongue is either protruded from the mouth, firmly grasped by the teeth, or it is applied so closely to the dental arch that the various teeth leave along its edge a distinct imprint. Here and there on the surface of the trunk may be observed patches of lividity which cannot be accounted for by the usual gravitation of blood

which takes place more or less in all forms of death. On the thighs the skin presents a roughened appearance, owing to the unusual development of the papillæ, and to this the name of *cutis anserina*, or goose-skin, has been applied. Among the external signs which we are passing in review the state of the hands and fingers merits special attention. In his dying agonies the drowned individual spasmodically clutches for help in all directions, and, should it be a pond or a canal with built retaining walls into which he has fallen, his nails may be injured, sand or mud may be found beneath them, and, firmly grasped in the hand, may be vegetable structures from the sides or the bottom of the pond; or, on the other hand, his fingers may present traces of recent injury.

Internally, the usual signs of asphyxia or apnoea are well marked. These are—(1) A distended condition of the right cavities of the heart with dark fluid blood, while the left are well contracted, and are either empty or contain only a small quantity of dark-coloured blood. (2) The lungs are developed, and highly congested. On their tissue being incised, the cut surfaces on pressure give out dark-coloured blood and frothy mucus in large quantity. (3) There is congestion of the mucous lining of the air passages; and (4) dark colour and fluidity of the blood through the body.

Among the signs specially characteristic of this form of asphyxia we have—(1) An unusual quantity of water in the stomach (amounting to one or two pints), which can only be accounted for by water having been swallowed during the last agonies of death. In many cases this cannot be determined with any degree of certainty, the fluid found in the stomach presenting no characters by which it can be positively identified as having formed a portion of the water in which the drowning occurred. In other cases, the fluid by certain characters, as its taste, can be determined to be sea-water, or from its containing some foreign substances, such as aquatic plants or insects, &c., can be identified as the water of the pond or river in which deceased was found. (2) Water in small quantity has been detected in the air-passages. But this, as we shall show, is a sign of little importance, and even in the most favourable circumstances one not easily observed. (3) A peculiar foamy froth presents itself in the throat and windpipe. The appearance of this froth is most striking. It is of a silvery whiteness, and when closely examined is seen to be composed of an infinitude of minute bullæ of air. Its origin is easily explained. In the struggle for breath, mucus is poured out along the air passages in greatly increased quantity, and this, together with any water that may have entered, is churned up along with the air which is pent up in the windpipe. Where death has been attended with violent struggling this froth is poured out in great quantity, and may occupy the mouth and nostrils. It is a sign of great importance, as showing that the person was alive while in the water. It is, however, apt to be confounded with a somewhat similar appearance in two other forms of death. When acute bronchitis proves fatal, the air-passages are filled with frothy mucus—which, however, differs in its external characters from the froth found in the drowned. It is not foamy, and the bullæ of air are much larger. In addition the special signs of an acute disease of the bronchial tubes are present. In death occurring during a fit of epilepsy, frothy mucus is also often found in the windpipe, but in comparatively small quantity as compared with death by drowning, and the bullæ are of larger size.

Of course when all the characteristic signs are present the evidence of drowning is so much the stronger, but it is quite possible, from the presence of a well-marked sign, to be certain as to the cause of death. A girl had fallen asleep during the night close to a stove in the cabin of a coal barge. Her clothes accidentally caught fire, and the

pain of the burning quickly awoke her. In her desperation she rushed up the cabin stairs and threw herself into the water. In the morning her body was recovered considerably burned and covered with the charred dress. The conduct of the parties in the barge at the time was open to suspicion, and it was of importance to determine whether the body had not been thrown into the water after death. All the signs of death by drowning were well marked. The stomach contained water in considerable quantity, and floating on the surface of this fluid were two charred fragments of the dress. These must have been swallowed. The burnt dress was very friable, and portions of it similar to those found floating in the stomach broke away on the slightest touch. The surface of the canal in the immediate neighbourhood of deceased must, during her dying agonies, have been covered with these fragments, and the water which she swallowed happened to contain two of these fragments. Their presence clearly indicated that deceased was alive after she had reached the water. Again, cases have come under our notice, and many such are on record, where in the hand of the deceased have been found firmly grasped a bunch of aquatic vegetable structures which were known to grow only at the bottom of the pond in which the body was found.

Experiments on dogs show that complete immersion produces fatal asphyxia in four minutes, and in man from one to two minutes suffices to cause death. On the other hand, a certain amount of practice enables experienced swimmers to resist asphyxia; and it is related that in 1872 the champion swimmer of England, of the name of Johnson, remained under water for three minutes and ten seconds. It is also known that recovery has followed after an immersion of twenty minutes. In such cases it is to be presumed that the immersion was not complete. As to the sensations of the drowned, after the first struggle for breath, the brain becomes loaded with venous blood, and unconsciousness to external objects ensues. Captain Marryatt tells us that his sensations as he was drowning were rather pleasant than otherwise. "The first struggle for life once over, the water closing round me assumed the appearance of waving green fields. . . . It is not a feeling of pain, but more like sinking down, overpowered by sleep, in the long soft grass of a cool meadow." (*Life*, vol. i. p. 74.) Hence drowning is a favourite death with suicides, in whom—resolutely bent, as they generally are, on self-destruction—the preliminary struggle is soon over. The presence of marks of violence is our only indication of homicide, and when these are absent the verdict of the medical jurist must be that the case is either one of suicide or of simple accident.

One circumstance, however, interferes with the recognition of the signs which we have passed in review, and that is the presence of putrefaction or decay. In consequence of death having occurred in such a medium as water, and as from the sinking of the body it is not exposed to atmospheric air, putrefaction in the colder months of the year proceeds slowly; but in summer, owing to the rapid development of gas in all the soft structures of the body, but especially in the intestines, the body quickly comes to the surface of the water, and decomposition proceeds with great rapidity. All the canals of the body are relaxed, and the pressure of gas is such as to force the froth from the air passages, the water from the stomach, and the blood from the heart. "Almost never," says Devergie, the great authority on the effects of putrefaction in the drowned, "can the signs of drowning during life be determined in summer, so quick is the gaseous putrefaction." Hence, too great caution cannot be exercised by the medical jurist in giving a positive opinion in such cases.

It is remarkable that the progress of putrefaction in persons who have died by drowning should differ widely

from that of the same process in other forms of death. In ordinary cases, the first signs of putrefaction manifest themselves in the lower parts of the abdomen. The rest of the trunk is attacked, then the extremities, and lastly the face. In drowning, on the contrary, the first part of the body to show evidence of decay is the face; and in the course of a few hours, so rapid is the advance of the putrefactive process, that it becomes utterly impossible to recognize the features. Hence it is that it has been chiefly in cases of drowning that difficulties have arisen as to identification, in consequence of that part of the body by which persons are most readily recognized undergoing alteration so rapidly. Devergie, who, from his official connection with the Morgue at Paris, enjoyed unusual facilities for watching the various stages of putrefaction in the drowned, has carefully described them, and we now proceed to give a *résumé* of his observations. The 1st stage includes a green discoloration of the skin, first noticed on the face and neck, which gradually extends over the body. The 2d is the evolution of gas, distending the abdomen, and causing those changes to which we have already adverted. The 3d is that of brown putrefaction, which affects all the parts of the body previously coloured green. The 4th is that of putrilage. The discoloured parts soften, liquefy, and disappear. Under such circumstances the body rapidly decays, and the bones fall asunder. On the other hand, in cool weather the process of liquefaction is arrested, and the soft parts become solidified, owing to their conversion into adipocere, a peculiar kind of animal soap. To this stage—the 5th—Devergie gives the name of saponification. The 6th stage is termed desiccation, or drying, from the continued removal of the fluids from the body, which, thus hardened, is liable, from the action of the elements, to undergo corrosion; and at the same time long immersion leads to the formation of various incrustations. Devergie treats of these two conditions under the heads of corrosion and incrustation. In the 9th and last stage we have the destruction of the soft parts generally. In the liquid decomposition the part of the body first attacked was the face, and the same order is observed in the later stages—the soft parts of the face, now hardened by their transformation into adipocere, fall off, and leave nothing but a grinning skeleton of a face behind, the rest of the body being comparatively perfect. This peculiar progress of the process of decomposition in the drowned explains the cases recorded of apparently decapitated heads, and of bodies consisting of headless trunks, having been found floating in the sea. These stages of the putrefactive process Devergie states do not follow any definite order or period of sequence, and each case demands careful investigation as to the condition of the body and the time of the year when the drowning occurred, but as the result of his experience he finds that the respective seasons of summer and winter make at least a month's difference in the period at which the earlier changes occur.

As to the treatment of the drowned, a complete revolution has in recent times taken place in its details. To induce a renewal of the respiration it was formerly recommended that air should be forcibly introduced into the lungs by means of a pair of bellows, and, according to the older directions of the Humane Society, the body was "to be well shaken every ten minutes in order to render the process of animation more certain." These expedients proved singularly inefficacious except in cases where the other proposals of the society, such as rubbing and the application of warmth, would of themselves have procured recovery. In 1856 Dr Marshall Hall devised his ready method or postural treatment of the asphyxiated, and by dissections, and by actual results in cases of still birth and of drowning, proved that respiration could be imitated by

simply changing the position of the body. Since then Dr R Silvester has suggested a still more simple plan of postural treatment which, along with that of Dr Marshall Hall, has been adopted by the Humane Society and also by the National Life Boat Institution, from whose published directions we give the modern treatment of the drowned by both methods, which is "in use in Her Majesty's Fleet, in the Coast-guard Service, and at all the stations of the British Army at home and abroad."

DIRECTIONS FOR RESTORING THE APPARENTLY DROWNED.

I. Send immediately for medical assistance, blankets, and dry clothing, but proceed to treat the patient *instantly* on the spot, in the open air, with the face downward, whether on shore or afloat, exposing the face, neck, and chest to the wind, except in severe weather, and removing all tight clothing from the neck and chest, especially the braces. The points to be aimed at are—first and *immediately*, the restoration of breathing, and secondly, after breathing is restored, the promotion of warmth and circulation. The efforts to restore breathing must be commenced immediately and energetically, and persevered in for one or two hours, or until a medical man has pronounced that life is extinct. Efforts to promote warmth and circulation, beyond removing the wet clothes and drying the skin, must not be made until the first appearance of natural breathing; for if circulation of the blood be induced before breathing has recommenced, the restoration to life will be endangered.

II.—TO RESTORE BREATHING.—*To clear the throat*—Place the patient on the floor or ground with the face downwards, and one of the arms under the forehead, in which position all fluids will more readily escape by the mouth, and the tongue itself will fall forward, leaving the entrance into the windpipe free. Assist this operation by wiping and cleansing the mouth. If satisfactory breathing commences, use the treatment described below to promote warmth. If there be only slight breathing—or no breathing—or if the breathing fail, then—

To excite breathing—Turn the patient well and instantly on the side, supporting the head, and excite the nostrils with snuff, harts-

FIG 1.—Inspiration (Dr Marshall Hall's method).

FIG 2.—Expiration (Dr Marshall Hall's method)

horn, and smelling salts, or tickle the throat with a feather, &c. if they are at hand. Rub the chest and face warm, and dash cold water, or cold and hot water alternately, on them. If there be no success, lose not a moment, but instantly—

To imitate breathing—Replace the patient on the face, raising and supporting the chest well on a folded coat or other article of dress. Turn the body very gently on the side and a little beyond, and then briskly on the face, back again, repeating these measures cautiously, efficiently, and perseveringly, about fifteen times in the minute, or once every four or five seconds, occasionally varying the side. (By placing the patient on the chest, the weight of the body forces the air out; when turned on the side, this pressure is removed.

and air enters the chest.) On each occasion that the body is replaced on the face, make uniform but efficient pressure with brisk movement on the back between and below the shoulder-blades or bones on each side, removing the pressure immediately before turning the body on the side. During the whole of the operations let one person attend solely to the movements of the head and of the arm placed under it. (The first measure increases the expiration—the second commences inspiration.) The result is respiration or natural breathing, and, if not too late, life.

Whilst the above operations are being proceeded with, dry the hands and feet, and as soon as dry clothing or blankets can be procured, strip the body, and cover or gradually re-clothe it, but taking care not to interfere with the efforts to restore breathing.

III. Should these efforts not prove successful in the course of from two to five minutes, proceed to imitate breathing by Dr Silvester's method, as follows:—Place the patient on the back on a flat surface, inclined a little upwards from the feet, raise and support the head and shoulders on a small firm cushion or folded article of dress placed under the shoulder-blades. Draw forward the patient's tongue, and keep it projecting beyond the lips; an elastic band over the tongue and under the chin will answer this purpose, or a piece of string or tape may be tied round them, or by raising the lower jaw, the teeth may be made to retain the tongue in that position. Remove all tight clothing from about the neck and chest, especially the braces

FIG. 3.—Inspiration (Dr Silvester's method).

FIG. 4.—Expiration (Dr Silvester's method).

To imitate the movements of breathing—Standing at the patient's head, grasp the arms just above the elbows, and draw the arms gently and steadily upwards above the head, and keep them stretched upwards for two seconds. (By this means air is drawn into the lungs.) Then turn down the patient's arms, and press them gently and firmly for two seconds against the sides of the chest. (By this means air is pressed out of the lungs.) Repeat these measures alternately, deliberately, and perseveringly, about fifteen times in a minute, until a spontaneous effort to respire is perceived, immediately upon which cease to imitate the movements of breathing, and proceed to induce circulation and warmth.

IV.—TREATMENT AFTER NATURAL BREATHING HAS BEEN RESTORED. To promote warmth and circulation—Commence rubbing the limbs upwards, with firm grasping pressure and energy, using handkerchiefs, flannels, &c. (By this measure the blood is propelled along the veins towards the heart.) The friction must be continued under the blankets or over the dry clothing. Promote the warmth of the body by the application of hot flannels, bottles, or bladders of hot water, heated bricks, &c., to the pit of the stomach, the armpits, between the thighs, and to the soles of the feet. If the patient has been carried to a house after respiration has been restored, be careful to let the air play freely about the room.

On the restoration of life, a teaspoonful of warm water should be given; and then, if the power of swallowing have returned, small quantities of wine, warm brandy-and-water, or coffee should be administered. The patient should be kept in bed, and a disposition to sleep encouraged.

GENERAL OBSERVATIONS.—The above treatment should be per-

severed in for some hours, as it is an erroneous opinion that persons are irrecoverable because life does not soon make its appearance, persons having been restored after persevering for many hours. The appearances which generally accompany death are the following:—breathing and the heart's action cease entirely; the eyelids are generally half closed, the pupils dilated; the tongue approaches to the under edges of the lips, and these, as well as the nostrils, are covered with a frothy mucus, coldness and pallor of surface increase.

The following cautions should be attended to—Prevent unnecessary crowding of persons round the body, especially if in an apartment. Avoid rough usage, and do not allow the body to remain on the back unless the tongue is secured. Under no circumstances hold the body up by the feet. On no account place the body in a warm bath unless under medical direction, and even then it should only be employed as a momentary excitant.

Dr Silvester's method is more generally practised than that of Dr M. Hall,—its special advantages being that it commences by imitating inspiration, and more completely distends the chest. But we are of opinion that the combination of the two methods as recommended above should undoubtedly be practised in every case.

It has frequently been pointed out that in fatal cases of drowning the right auricle of the heart is very much distended, and it has been plausibly urged by Professor Struthers of Aberdeen (*Edinburgh Medical Journal*, 1857, p. 418) that the movements of respiration may be successfully imitated, and air may enter the lungs, and yet the patient may not recover in consequence of the stoppage of the action of the heart. He recommends that blood should be drawn from the external jugular vein, so as to relieve the engorged auricle, which, from its distension, is paralyzed. The abstraction of a small quantity of blood is all that is required to effect this—from half to one or two table-spoonfuls. Finally, as a last resource, galvanism must be had recourse to. Both this and the blood-letting must be practised by a qualified medical man; but it is important to know that the methods of Dr Hall and Dr Silvester can easily be learned by any one, and that, if early and perseveringly applied, they are attended with a large measure of success. The treatment must be continued for at least eight hours, should there be an absence of extreme pallor, and while any heat of the body remains.

The question of the treatment of the drowned cannot be regarded as definitely settled, and the plans of Hall and Silvester have from time to time been subjected to criticism. Among the latest suggestions is that of Dr B. Howard of America, who, by means of what he terms his "direct" method, which mainly consists in pressure of the chest from above (the patient being placed on his back), claims that air is more easily introduced into the lungs, and that the expansion and contraction of the chest are more perfectly attained (see *Lancet*, August 11, 1877). At the meeting of the British Medical Association at Manchester 1877, Dr Howard practically demonstrated his plan on the living subject, and there can no doubt that involuntary respiration was readily produced. Farther evidence, however, is necessary from actual cases of suspended animation.

See the treatises on Medical Jurisprudence by Deyergie, Orfila, Caspar, Taylor, Guy, and Woodman and Tidy, article "Apnoea," by G. Harley, M.D., in vol. v. of Holmes's *Surgery*, 2d edition, pp. 889; and Report on Asphyxia by Committee of the Royal Medical and Chirurgical Society of London, in vol. xlv. of *Transactions*, 1862. (H. D. L.)

DROZ, FRANÇOIS-XAVIER JOSEPH (1773–1850), a French writer on moral and political subjects, was born on October 31, 1773, in the city of Besançon, where his family had furnished men of considerable mark to the legal profession. His own legal studies led him to Paris in 1792; he arrived on the very day after the dethronement of the king, and was present during the massacres of September; but on the declaration of war he joined the volunteer *bataillon* of the Doubs, and for the next three years served in the army

of the Rhine. Receiving his discharge on the score of ill health, he soon after obtained a much more congenial post in the newly-founded *école centrale* of his native city; and in 1799 he made his first appearance as an author by an *Essai sur l'art oratoire*, Paris, Fructidor, An VII., in which he acknowledges his indebtedness more especially to Hugh Blair. This early reference to Scottish literature is interesting in connection with the peculiarly Scottish tone of mind which is observable in his writings, and has attracted the notice of Sainte-Beuve. Removing to Paris in 1803, he became intimate not only with the like-minded Ducis, but also with the sceptical Cabanis; and it was at the philosopher's advice that, in order to catch the public ear, he produced the romance of *Lina*, which Sainte-Beuve has characterized as a mingled echo of *Florian* and *Werther*. Like several other literary men of the time, he obtained a post in the revenue office known as the *Droits réunies*, then under the control of M. François of Nantes; but from 1814 he devoted himself exclusively to literature and became a contributor to various journals. Already favourably known by his *Essai sur l'art d'être heureux*, Paris, 1806, his *Eloge de Montaigne*, 1812, and his *Essai sur le beau dans les arts*, 1815, he not only gained the Montyon prize in 1823 by his work *De la philosophie morale ou des différents systèmes sur la science de la vie*, but also in 1824 obtained admission to the Académie Française. The main doctrine inculcated in this treatise is that society will never be in a proper state till men have been educated to think of their duties and not of their rights. It was followed in 1825 by *Application de la morale à la philosophie et à la politique*, and in 1829 by *Économie politique, ou principes de la science des richesses*, a methodical and clearly written treatise, which has had the honour of being edited by Michel Chevalier in 1854. His next and greatest work was a *Histoire du règne de Louis XVI.* (3 vols. Paris, 1838–1842), the result of very careful and prolonged study, and marked by greater vigour of style and deeper powers of thought than he had previously displayed. As he advanced in life Droz had become more and more decidedly religious, and the last work of his prolific pen was *Pensées du Christianisme*, 1842. Few have left so blameless a reputation: in the words of Sainte-Beuve, he was born and he remained all his life of the race of the good and the just.

See Guizot, *Discours Académiques*; Montalembert, "Discours de Réception," in *Mémoires de l'Académie française*; Sainte-Beuve, *Causeries du lundi*, t. iii.; Michel Chevalier, Notice prefixed to the *Économie politique*.

DRUIDISM, the name usually given to the religious system of the ancient Gauls and Britons. The word Druid, one form or other of which is used in early Celtic records to designate a class of priests corresponding to the Magi or wise men of the ancient Persians, is of uncertain etymology. The derivation from the Greek *δρῦς*, an oak, though as old as the days of the elder Pliny, is probably fanciful.

We find in Cæsar the first and at the same time the most circumstantial account of the Druids to be met with in the classical writers. In the digression on the manners and customs of Gaul and Germany which occupies a portion of the sixth book of his Gallic war, he tells us that all men of any rank and dignity in Gaul were included among either the Druids or the nobles. The former were the religious guides of the people as well as the chief expounders and guardians of the law. On those who refused to submit to their decisions they had the power of inflicting severe penalties, of which excommunication from society was the most dreaded. As they were not a hereditary caste, and enjoyed exemption from service in the field as well as from payment of taxes, admission to the order was eagerly sought after by the youth of Gaul. The course of training to which a novice had to submit was protracted, extending

sometimes over twenty years. All instruction was communicated orally, but for certain purposes they had a written language in which they used the Greek characters. The president of the order, whose office was elective and who enjoyed the dignity for life, had supreme authority among them. They taught that the soul was immortal. Astrology, geography, physical science, and natural theology were their favourite studies. Britain was the head-quarters of Druidism, but once every year a general assembly of the order was held within the territories of the Carnutes in Gaul, probably in the neighbourhood of the modern Dreux. The Gauls in extreme cases offered human sacrifices, usually criminals. Their chief deity was identified by Cæsar with the Mercury of the Romans. Writing a few years later, Cicero, in his treatise on divination, introduces his brother Quintus as remarking on the existence among the Gauls of augurs or soothsayers, known by the name of Druids. With one of these, Divitiacus, an Ædnan, Quintus says he was well acquainted. Cicero's contemporary, Diodorus Siculus, informs us that there were among the ancient Gauls bards, certain philosophers and theologians named Druids, and soothsayers. He also hints at some connection between their philosophy and that of Pythagoras. The geographers, Strabo and Pomponius Mela, add little to our knowledge of the Druids. Lucan, in his *Pharsalia*, mentions, among the Gallic and other tribes that relapsed into their former ways upon Cæsar's crossing the Rhine, "the worshippers with bloody rites of Teutates, Hesus, and Taranis," and refers immediately afterwards to the bards and Druids. Something more noteworthy is told by the elder Pliny. According to him the Gallic Druids held the mistletoe in the highest veneration. Groves of oak were their chosen retreats. Whatever grew on that tree was thought to be a gift from heaven, more especially the mistletoe. When thus found the latter was cut with a golden knife by a priest clad in a white robe, two white bulls being sacrificed on the spot. The name given it by the Druids signified in their language All-Heal, and its virtues were believed to be very great. Two other herbs, called selago and samolus, were likewise greatly valued by them for their medicinal efficacy. But the most remarkable of all the Druidical charms was the anguennu, or snake's egg. It was said to be produced from the saliva and frothy sweat of a number of serpents writhing in an entangled mass, and to be tossed up into the air as soon as formed. The fortunate Druid who managed, as it fell, to catch it in his sagum, or cloak, rode off at full speed on a horse that had been in waiting for him, pursued by the serpents till they were stopped by the intervention of a running stream. A genuine specimen of this egg when thrown into the water would float against the current, even if encased in gold. Pliny declares that he had seen one. "It is," he says, "about the size of a moderately large round apple, and has a cartilaginous rind studded with cavities like those on the arms of a polypus." Tacitus, in describing the attack made on the island of Mona (Anglesea) by the Romans under Suetonius Paulinus, represents the legionaries as being awe-struck on landing by the appearance of a band of Druids who, with hands uplifted towards heaven, poured forth terrible imprecations on the heads of the invaders. The courage of the Romans, however, soon overcame such fears; the Britons were put to flight; and the groves of Mona, the scene of many a sacrifice and bloody rite, were cut down. The annalists Lampridius and Vopiscus, two of the *Scriptores Historiæ Augustæ*, introduce us, if the "Dryas" of these writers be connected, as is probable, with the "Druides" of Cæsar and others, to a new branch of the order—Druidesses, who, however, are simply prophetic women. For example, Vopiscus tells us, on the authority of his grandfather, who

had the story from the future emperor himself, that it had been foretold to Diocletian by one of these women that he would wear the purple after he had slain a wild boar. Many years afterwards, when Diocletian found himself, on the death of Numerian, unexpectedly declared emperor by the troops, he at once cut down with his sword Arrius Aper, regarding whom dark suspicions were afloat, exclaiming, "At length I have slain the fated wild boar," and thus fulfilled the prophecy delivered to him in Gaul by the weird woman. Ausonius of Bordeaux, tutor of Gratian, son of the Emperor Valentinian, in his *Professores*, or notices of the professors of his native city, apostrophizes the rhetorician Attius Pater as sprung from a race of Druids and from the priesthood of Belenns, and as deriving his name of Patera from being connected through the latter with the mysteries of Apollo. He also addresses another as keeper of the temple of Belennus, and as the offspring of the Druids. Lastly, Ammianus Marcellinus, after noticing the foundation of Marseilles by a colony of Phœceans, goes on to state that when the people in those parts had been gradually civilized, learned studies, which had been begun by the bards, the Euhages (probably a corruption of the *Odræis*, i.e., *Vates*, of Strabo), and the Druids, thrived vigorously. Of these, he says the Druids were intellectually superior to the others, and were formed into unions in accordance with the precepts of Pythagoras.

The early Christian fathers seldom mention the Druids. Origen, Clement of Alexandria, and others speak of them as philosophers or priests among the Gauls, but in a manner that shows they knew almost nothing about them. In early Irish poems and tales, however, a class of persons called by this name is frequently referred to, who also appear as Magi in certain well-known lives of Irish saints written in Latin. These Irish Druids were a kind of sorcerers. They were said to be in league with the demons of paganism, and to be able by this agency to do good to their friends and mischief to their enemies. The followers of the first missionaries of Christianity in Ireland and Scotland seem to have thought it necessary, in order to prove the superiority of the new faith, to spread the belief that its apostles also were gifted with supernatural powers, which they could use more especially for the purpose of counteracting the malice of these Druids. Thus Adamnan, in his life of Columba, represents that saint as miraculously baffling the machinations of Broichan, the Druid of the Pictish king Brude, when they met at the court of the latter near the mouth of the Ness.

To John Toland probably belongs the credit of being the first to plan, for he did little more, a connected history of the Druids, in which the scanty notices of ancient writers were to be expanded and largely supplemented by details drawn from other sources. This he did in three letters addressed to Viscount Molesworth, and first published from the author's papers in 1726, some years after his death. A little later, Pelloutier, in his *Histoire des Celtes*, carried out a portion of Toland's design by giving a lengthened account of the origin, position, and influence of Druidism among the early Celtic tribes. On the foundations thus laid others were not slow to build. It is from Cæsar and Pliny, of course, that the materials have been chiefly derived. But fragments of very doubtful value were eagerly appropriated from every quarter, and in this way an imposing structure was reared, the solidity of which till very recently few ever thought of doubting. If we may trust these writers, the ancient priesthood of Britain and Gaul, in pomp of ritual no less than in learning and influence, rivalled the hierarchies of later days. Clad in white and wearing ornaments of gold, they celebrated their mystic rites in the depths of the forest. The Hesus mentioned by Lucan was said, on the authority

of a remark by Lactantius, to be their chief deity. But they had other gods, especially Apollo, whom they worshipped under the name of Belenns, supposed to be the Phœnician Baal. They believed in metempsychosis, or the doctrine of the transmigration of souls. That their philosophy was identical with that of Pythagoras was held as certain, though whether Pythagoras was the instructor of the Druids or the Druids of Pythagoras, or whether indeed both did not derive their tenets from a common source, were moot questions. Pythagoras's friend Abaris, the mysterious Hyperborean philosopher who rode on an arrow, the gift of Apollo, must have been a British Druid. Botany, astronomy, medicine, and letters were all subjects studied by the Druids; though, in spite of their boasted civilization, many of their rites were barbarous in the extreme. In mechanics they had attained to no mean skill, since the ponderous megalithic remains of Britain and France could have been set up only by them. Stone circles like Stennis and Callernish were ancient temples, once surrounding groves sacred to Druidism. According to Stukeley, Stonehenge was the cathedral of the arch-druid of all Britain, and Avebury with its avenues had been originally constructed in the form of a circle with a serpent attached to it,—the circle being regarded as the symbol of the Supreme Being, and the serpent of the divine Son. Dolmens or cromlechs were transformed into altars, and even the menhir or stone pillar, and the rocking-stone, were pressed into the service of the druidical priesthood. In the neighbourhood of the circles, as well as on the tops of mountains, may be seen cairns surmounted each by a flat stone, on which Druid fires were lighted. Over their countrymen the authority of the Druids was almost unbounded, continuing to assert itself long after the order had passed away. With Druidism every unexplained custom and almost every relic of Celtic antiquity were held to be connected, and the superstitions that still linger in the ancient homes of the Celtic race were set down as derived from the same source. Its decadence is attributed by these writers to the hostility of the Romans. Ardent lovers of their country as well as of liberty, the Druids, it is asserted, were the uncompromising foes of Roman rule in the west. Hence sprang the orders issued for their suppression by Clandius, to which reference is made both by Pliny and Suetonius. In the end, Rome proved too strong for Druidism, and the political power of its priesthood was soon broken, especially in Gaul and South Britain. Some, among whom Herbert is prominent, maintain that, after the destruction of pagan Druidism as a system, the order was revived as a corrupt form of Christianity, in which the truths of the latter were largely mixed up with the rites of Mithras, the sun god of the Persians. This hypothesis, to which its supporters have given the name of neo-Druidism, has already been noticed in the article *CELTIC LITERATURE* (vol. v. p. 318).

These views were for a long time generally received in this country as well as on the Continent. In France, Druidism has proved an attractive subject to some writers of a high order of ability, who have discussed it, if not from a more critical, at least from a more philosophical, stand-point. Amédée Thierry, in his *Histoire des Gaulois*, while adopting in the main the opinions of Toland, Pelloutier, and their followers, finds in the accounts that have come down to us traces of two distinct systems of religion in ancient Gaul. One of these was a worship of natural phenomena and objects, akin to the polytheism of the Greeks; the other a kind of metaphysical pantheism, strikingly resembling the religious of some Eastern nations. The latter, according to him, was the foundation of Druidism, and had been brought into the country when the Cymric branch of the Gauls entered it under a leader named Hu, or Hesus,

deified after his death. The more ancient inhabitants, also a Gallic race, were the polytheists, whose religious belief, however, the Cymri did not altogether destroy but rather amalgamated with their own. Thierry further thinks that Druidism was on the decline in Gaul before the days of Cæsar. After a time the Gallic nobles on the one hand, and the people on the other, became alike jealous of a priestly authority that controlled both and had succeeded in greatly reducing their political influence. For a while the Druids retained their power as a religious and learned order, and preserved many of their privileges; but even at the date of Cæsar's invasion these had so diminished that Britain, and not Gaul, was recognized as their chief seat. But the most distinguished among the expounders of Druidism is undoubtedly Jean Reynaud, one of the chiefs of a small school of thinkers whose metaphysical speculations have exercised in France a real, if an indirect and quiet, influence. Reynaud, who was of a mystical cast of mind, began in 1836, along with Pierre Leroux, the publication of *L'Encyclopédie Nouvelle*, which, however, was never finished. For this the former wrote the article "Druidisme," which he afterwards enlarged and gave to the world separately under the title of *L'Esprit de la Gaule*, dedicated to his friend, the historian Henri Martin. It is an elaborate and in some respects able essay. Reynaud maintains that the ancient Druids were the first to teach clearly the doctrine of the soul's immortality, and that they had originally as high conceptions of the true nature of God as the Jews themselves. If they afterwards encouraged the worship of subordinate deities, it was for the purpose of reconciling to Druidism that class of uneducated minds for which the cultus of demi-gods and angels has more attraction than the worship of the Unseen One. Hæsus, radically the same word as the *Aïōa* of the Greeks, was the type of an absolute supreme Being whose symbol on earth was the oak, and was quite distinct from Hu, the leader of the Cymric Gauls. The mistletoe, when found growing on the latter, represented man, a creature entirely dependent on God for support, and yet with an individual existence of his own. Human sacrifices were a natural consequence of the idea, dominant now as in the days of the Druids, that the higher the victim the more complete the atonement offered to the Deity for the sins of man. Druidism declined and at last disappeared, because, according to Reynaud, one element was wanting in its system both of morals and of religion, necessary to the true development of man or society—charity or love. The Druids aimed indeed at the improvement of both, but failed to prescribe the true means of promoting it. Christianity supplied what was needed, and Druidism disappeared—not, however, till it had accomplished what was its special mission, the preservation in Western Europe of the idea of the unity of God. How far all this is mere theory founded on insufficient data, or an attempt, more or less successful, to prove the existence among the Gallic tribes of certain ideas regarding the true nature of God and his relation to man, which afterwards degenerated into the grossest superstition, it would be out of place to discuss here. Reynaud's views have been to a great extent accepted by Henri Martin, one of the foremost of French historical writers; and both countenance the neo-Druidical fancies of Davies and Herbert. In Germany the latest authority on Druidism seems to be Barth—*Ueber die Druiden der Kelten*—who follows closely the views long popular in this country. To judge from the article "Druiden" in the last edition (1875) of Meyer's *Conversations-Lexikon*, nothing fresher has yet found currency there.

Literature.—Toland's *Specimen of the Critical History of the Celtic Religion and Learning, containing an Account of the Druids*, in *A Collection of several Pieces of Mr John Toland, now first*

published from his original Manuscripts, 2 vols 8vo, London, 1726; Pelloutier (Simon), *Histoire des Celtes*, 2 vols. 12mo, Paris, 1740–1750, nouvelle édition par M de Chumac, 2 vols 4to, or 8 vols 8vo, Paris, 1770–1771, Stukeley's *Stonehenge, A Temple restored to the British Druids*, fol London, 1740, Stukeley's *Abury, A Temple of the British Druids*, fol London, 1743; Frick (Johann Georg), *Commentatio de Druidis occidentaliū populorum philosophis*, new edition, 4to, Ulme, 1744; Borlase's *Antiquities, Historical and Monumental, of the County of Cornwall*, second edition, fol London, 1769, Davies (Edward), *Mythology and Rites of the British Druids*, 8vo, London, 1809, Thierry's *Histoire des Gaulois*, Paris, 1828, Barth, *Ueber die Druiden der Kelten*, Erlangen, 1828, Higgins's *Celtic Druids*, London, 1829, (Herbert's) *Essay on the Neo-Druidic Heresy in Britannia*, pt 1, London, 1838, Dr J H Burton, in *Edinburgh Review*, July 1863, Reynaud, *L'Esprit de la Gaule*, Paris, 1866; Henri Martin, *Histoire de France*, vol 1, Paris (no date), Stuart's *Sculptured Stones of Scotland*, vol. II, printed for the Spalding Club, 1867. (J M'D)

DRUM, a musical instrument of percussion, which is supposed to have been introduced into Europe from the East by the Moors or after the Crusades. In certain forms, however, it was known in Europe in classical times. The Greek and Roman *tympānum* seems from descriptions and pictorial representations to have included not only tambourines but kettledrums of a small size, or at least instruments convex on one side like the kettledrum. The instrument designated in Scripture a timbrel (Heb *toph*) was undoubtedly a kind of tambourine, such as might be conveniently played by females. In India and Egypt the use of drums in a considerable variety of forms may be traced back to the earliest historic times. The tam-tam or tom-tom of India, a cylindrical drum of some size beaten with the fingers, had its counterpart in Egypt at least as early as 1600 B.C. Among savage races, whose music has not risen above the primitive or percussive stage, the drum is naturally the chief, and in many cases the sole instrument employed. Three principal forms of drum are in general use in the modern orchestra,—the common or side drum, the base or Turkish drum, and the kettledrum. The first is composed of a cylinder of wood, or, more generally, of metal, covered at each end with vellum or parchment, the tension of which is regulated by strings. As its name indicates, it is worn at the side of the performer, who beats upon the upper end with two sticks. Its distinctive though not its exclusive use is to accompany the military fife band. The base drum is a larger instrument of the same kind, the cylinder being composed of oak. It is beaten at both ends with drum-sticks furnished with leather pads. It is an important constituent of a full military band, but it is also employed in the orchestra, especially by more recent composers. The kettledrum is the most important form of the instrument in orchestral as distinct from military music. It is composed of a basin of brass or copper, almost hemispherical in shape, covered with vellum attached to an iron ring, and it is usually placed upon an iron tripod. By means of screws it is capable of being tuned within certain necessarily narrow limits. Kettledrums are always used in pairs, one being tuned to the key-note and the other to the fourth below. The music is usually written in the key of C, and the key in which it is to be played, if different, is indicated in words at the beginning of the passage. The three forms of drum just described are essential in every complete orchestra. In addition other percussive instruments, such as the gong and the tam-tam, are sometimes introduced for the sake of particular effects.

DRUMMOND, HENRY (1786–1860), an English banker, politician, and miscellaneous writer, remarkable for the versatility of his gifts and the eccentricity of his character, was born on the 5th December 1786. He was the eldest son of Henry Drummond, a prominent London banker, by a daughter of the first Lord Melville. He was educated at Harrow and at Christ Church, Oxford. His name is per-

manently connected with the university through the chair of political economy, which he founded in 1825. He entered Parliament in early life, and took an active interest from the first in nearly all departments of politics. Thoroughly independent and often eccentric in his views, he yet acted generally with the Conservative party. He was an effective speaker, clear and forcible, and on occasion caustic and severe. From 1847 until his death on the 20th February 1860 he represented West Surrey. Drummond took a deep interest in religious subjects, and published numerous books and pamphlets on such questions as the interpretation of prophecy, the circulation of the Apocrypha, the principles of Christianity, &c., which attracted considerable attention. He was intimately associated with the origin and spread of the Catholic Apostolic or "Irvingite" Church. Stated meetings of those who sympathized with Irving were held for the study of prophecy, between 1826 and 1830 at his seat of Albury Park, in Surrey; he contributed very liberally to the funds of the new church; and he became one of its leading office-bearers. The numerous works he wrote in defence of its distinctive doctrines and practice were generally clear and vigorous, if seldom convincing.

DRUMMOND, THOMAS (1797–1840), was born at Edinburgh in October 1797, and was educated at the High School there. He was appointed to a cadetship at the Royal Military Academy, Woolwich, in February 1813; and by Christmas of that year he had entered the Second Academy. He early distinguished himself by his aptitude for mathematics, and an original demonstration in conic sections, discovered by him whilst still in the junior Academy, was published in *Leybourn's Mathematical Repository*. In 1815 he entered the Royal Engineers. In 1819, when meditating the renunciation of military service for the bar, he made the acquaintance of Colonel Colby, from whom in the following year he received an appointment on the trigonometrical survey of Great Britain. During his winters in London he applied himself indefatigably to the higher branches of mathematics, and attended the chemical lectures of Brande and Faraday at the Royal Institution. The mention at one of these of the brilliant luminosity of lime when incandescent suggested to him the employment of that material instead of the Argand lamp for making surveying stations visible when far distant. In the autumn of 1824 he assisted Captain Colby in the selection of stations for the great triangulation, and the best situation as a base for the survey ordered to be made in Ireland. His lime-light apparatus (the Drummond light) and heliostat, both completed in 1825, he first put to a practical test in 1826 at the stations of the Irish survey. In the next season he brought into use an improved form of his heliostat, in which the telescope was dispensed with. Through the recommendation of Mr Bellenden Ker, Drummond was in 1831 appointed by Lord Brougham to be superintendent of the Boundary Commission. On the passing of the Reform Act he resumed his duties on the survey,—which, however, he soon finally quitted in order to become private secretary to Lord Althorp, the chancellor of the exchequer. In 1834, on the dissolution of the Government, he received a pension of £300 a year, which he drew until September 30, 1835. In July of that year he was made under-secretary of state for Ireland; and when, in 1836, the bill for municipal reform in that country was introduced into Parliament, he undertook the direction of the officers appointed to determine the boundaries of the boroughs. He was in October 1836 made head of the Irish Railway Commission, the report of which was completed in 1838. The health of Captain Drummond,—impaired originally by exposure during the Irish survey, and further injured by his unwearied exertions on the Boundary Com-

mission—had, through his last labours in connection with the railways of Ireland, received a strain from which it never recovered. His strength gradually gave way, and he died on the 15th April 1840.

See *Life* by J. F. M'Lennan, 1867, and Larcom in *Papers on the Duties of the Royal Engineers*, vol. iv., 1840.

DRUMMOND, WILLIAM (1585–1649), of Hawthornden, a Scottish poet of the Spenserian school, and descendant of an old family of noble blood, was born at Hawthornden, near Edinburgh, on the 13th December 1585. His father, John Drummond, was the first laird of Hawthornden; and his mother, Susannah Fowler, was well-connected, her brother William being private secretary to Queen Anne, and a man of literary tastes. Drummond received his early education at the Edinburgh High School, and graduated as M.A. of the recently founded (1582) metropolitan university in July 1605. The years 1607 and 1608 were spent at Bourges and Paris in the study of law; and, in 1609, Drummond was again in Scotland, where, by the death of his father in the following year, he became laird of Hawthornden at the early age of twenty-four. The list of books he read up to this time indicates a strong preference for the finer and more imaginative, as distinguished from the argumentative kinds of literature. Accordingly, on finding himself his own master, Drummond naturally abandoned law for the muses; "for," says his biographer in 1711, "the delicacy of his wit always run on the pleasantness and usefulness of history, and on the fame and softness of poetry." He was a good linguist, and read Latin, Greek, Italian, Spanish, French, and Hebrew. He had already written several poems, chiefly sonnets; and some early letters, which have been preserved, show a fine command of pure English, as well as Drummond's critical sagacity in abandoning the Scottish dialect for the language raised to literary supremacy by the illustrious Elizabethans. Drummond's first publication appeared in 1613, and was an elegy on the death of Henry, prince of Wales, called *Tears on the Death of Moliades*. As might have been expected from Spenser's influence, it is pastoral throughout. Milton, in his *Lycidas*, has at once imitated and surpassed this early poem of Drummond's. In 1614 Drummond for the first time met Sir William Alexander, known later as earl of Stirling, the author of a ponderous poem on *Doom's-day*. In the following year Drummond sustained a dreadful blow in the death of Miss Cunningham of Barns, to whom he was engaged to be married. In 1616, the year of Shakespeare's death, appeared *Poems: Amorous, Funerall, Divine, Pastorall: in Sonnets, Songs, Sektains, Madrigals*, being substantially the story of his love and loss. Drummond's next poem is entitled *Forth Feasting: A Panegyric to the King's Most Excellent Majesty*, and celebrates James's visit to Scotland in 1617. In 1618 there was an interesting correspondence between Drummond and Drayton, and, about the close of the same year, or about the beginning of 1619, Drummond was honoured with a visit of a fortnight or more from the great literary dictator of the time—Ben Jonson. Drummond, as tradition relates, sat awaiting Jonson's arrival under the shade of a fine sycamore, and exclaimed when Jonson came in sight, "Welcome, welcome, royal Ben!" Upon which the dramatist rejoined, "Thank ye, thank ye, Hawthornden." The famous account of their conversations, long supposed to be lost, was discovered in the Advocate's Library, Edinburgh, by Mr David Laing, and, after being read to the Society of Scottish Antiquaries in 1832, appeared, ten years later, as a publication of the Shakespeare Society. The conversations are full of interesting literary gossip, and embody Ben's opinion of himself and of his host, whom he frankly told that he "was too good and simple, and that oft a man's modesty made a fool of his wit."

The next few years in Drummond's life are comparatively uneventful, being marked only by correspondence with Sir William Alexander and Dryton. In 1623, the year of a great famine and consequent mortality in Scotland, appeared the poet's fourth publication, entitled *Flowers of Zion: By William Drummond of Hawthorndene: to which is adjoyned his Cypress Grove*. From 1625 till 1630 Drummond was probably for the most part engaged in travelling on the Continent. In 1627, however, he seems to have been home for a short time, as, in that year, he appears in the entirely new character of the holder of a patent for the construction of military machines, entitled "*Littera Magistri Gulielmi Drummond de Fabrica Machinarum Militarium, Anno 1627.*" The same year, 1627, is the date of Drummond's munificent gift of about 500 volumes to the library of Edinburgh University. This collection, to which Drummond afterwards made additions, is kept in a separate cabinet, and is particularly rich in the English poets. In 1630 Drummond again began to reside permanently at Hawthornden; and, in 1631, he received his last letter from Dryton, who died in London on the 23d of December. In 1632 Drummond married Elizabeth Logan, by whom he had five sons and four daughters. In 1633 Charles made his coronation-vizit to Scotland; and Drummond's pen was employed in writing congratulatory speeches and poetry. As Drummond naturally preferred Episcopacy to Presbytery, we are not surprised to learn that he approved of the main object Charles had in view in this visit, although his peace-loving nature was averse to the means employed in establishing Episcopacy. Drummond was a true Scottish gentleman in his pride of blood. Partly to please the earl of Perth, and partly to satisfy his own curiosity, the poet had studied the genealogy of the family very carefully, and had given due prominence to the fact that Annabella Drummond, daughter of Sir John Drummond of Stobhall, was the queen of Robert III. This investigation was the real secret of Drummond's interest in Scottish history, and so we find that he now began his *History of the Lives and Reigns of the Five Jameses, Kings of Scotland*—a work which did not appear till 1655, and is remarkable only for its good literary style. His next work was called forth by the king's enforced submission to the opposition of his Scottish subjects. It is entitled *Irene; or a Remonstrance for Concord, Amity, and Love amongst His Majesty's Subjects*, and embodies Drummond's political creed of submission to authority as the only logical refuge from democracy, which he hated. In 1639 Drummond had to sign the Covenant in self-protection, but was uneasy under the burden, as existing squibs by him testify. Drummond's next work *Diapixia: or a Defence of a Petition tendered to the Lords of the Council of Scotland by certain Noblemen and Gentlemen*, January, 1643, is a political pamphlet in support of those royalists in Scotland who wished to espouse the king's cause against the English Parliament. Its burden is a passionate invective on the intolerance of the then dominant Presbyterian clergy; but *Irene* fails to do justice to the substantial work they had done. Drummond's subsequent works may be described briefly as royalist pamphlets, written with more or less caution, as the times required.

After being an invalid for several months the poet died on the 4th December 1649, and was buried in the churchyard of Lasswade, a neighbouring village.

The only works of Drummond which call for special notice are the *Cypress Grove* and the poems. The *Cypress Grove*, one of the noblest prose poems in literature, exhibits great wealth of illustration, much fine thinking, and an extraordinary command of musical English. It is an essay on the folly of the fear of death, and shows how much the author was impressed with the comparative insignificance of this world.

"This globe of the earth," says he, "which seemeth huge to us, in respect of the universe, and compared with that wide pavilion of heaven, is less than little, of no sensible quantity, and but as a point" (1711 edition, p. 123). Death, he argues, from many of its accidental associations, appears to be much more dreadful than it really is. Its universality, and a correct estimate of human life, ought to nerve us against the fear of death. Further, we should remember that death is not annihilation, but the vestibule to immortality and a higher life. The essay, which is composed throughout in a strain of lofty idealism, is concluded in the form of a vision.

A noteworthy feature in Drummond's poetry is that it manifests no characteristic Scottish element, but owes its birth and inspiration rather to the English and Italian masters. This was owing partly to his anti-Presbyterian bias and his long residence abroad, but it was also natural, on other grounds, for a quiet, cultured, and meditative poet to imitate the Elizabethans and the great Italian writers. Drummond was essentially a follower of Spenser, delighting in the description of outer nature; but, amid all his sensuousness, and even in those lines most conspicuously laden with lustrous beauty, there is a dash of melancholy thoughtfulness—a tendency deepened by the death of his first love.

Drummond was so successful as a writer of sonnets that he was called "the Scottish Petrarch," and his sonnets are still ranked immediately after Shakespeare's, Milton's, and Wordsworth's. Most of his poems are steeped in the pre-Copernican ideas of astronomy, and are marked by a sense of the smallness of the visible in comparison with the infinite lying beyond. This is one of Drummond's favourite moods; and he is constantly harping upon such phrases as "the All," "this great All." Even in such of his poems as may be called more distinctively Christian, this philosophic conception is at work. Drummond's poems are distinguished by pensive beauty, sweetness of versification, and richly worded descriptions, but lack vigour and originality. Altogether this poet is to be remembered as the best representative of "sweetness and light" amid much that was dull and ephemeral in contemporary Scottish literature.

There are several editions of his works—(1) Hall's edition of the prose works, published in 1655; (2) Phillips's (a nephew of Milton) edition of the poems, which appeared in the same year; (3) Bishop Sage's, published in 1711, the only complete edition of Drummond's writings; (4) an edition of his poems by Lord Dundrennan and David Irving, issued in 1832; (5) Cunningham's edition of the poems of 1833; and (6) Turnbull's in 1857. The only collected edition of the prose writings was published in 1711. Drummond's life has been ably written by Professor Masson (1873). (T. G. I.)

DRUNKENNESS may be either an *act* or a *habit*, the latter consisting in frequent repetitions of the former. As an act it may be an accident, most usually arising from the incautious use of one or other of the commonly employed intoxicating agents, as a habit it is one of the most degrading forms of vice which can result from the enfeeblement of the moral principle by persistent self-indulgence.

Drunkenness is a mere complexity of symptoms which may arise from many different causes. To be drunk is simply to be apoplectic; and the close resemblance between the pathological and the toxic phenomena has been the cause of many untoward accidents. Cold alone may produce such peculiar effects that Captain Parry has said, in his *Journal*, "I cannot help thinking that many a man may have been punished for intoxication who was only suffering from the benumbing effects of frost; for I have more than once seen our people in a state so exactly resembling that of the most stupid intoxication, that I should certainly have charged them with that offence had I not been quite sure that no possible means were afforded them on Melville Island to procure anything stronger than snow water."

But, apart from the pathological causes of seeming drunkenness, this condition may be actually produced by a multitude of agents whose use is so wide-spread throughout the world as inevitably to lead to the belief that their moderate employment must subserve some important object in the economy of nature. Moreover, the physiological action of all these agents gradually shades into each other, all producing or being capable of producing consecutive paralysis of the various parts of the nervous system, but only in doses of a certain amount,—a dose which varies with the agent, the race, and the individual. Even the cup so often said to “cheer, but not inebriate,” cannot be regarded as altogether free from the last-named effect. Tea-sots are well known to be affected with palpitation and irregularity of the heart, as well as with more or less sleeplessness, mental irritability, and muscular tremors, which in some culminate in paralysis; while positive intoxication has been known to be the result of the excessive use of strong tea (*Third Annual Report of the Massachusetts Board of Health*, p. 129). In short, from tea to hashisch we have, through hops, alcohol, tobacco, and opium, a sort of graduated scale of intoxicants, which stimulate in small doses and narcotize in larger,—the narcotic dose having no stimulating properties whatever, and only appearing to possess them from the fact that the agent can only be gradually taken up by the blood, and the system thus comes primarily under the influence of a stimulant dose. In certain circumstances and with certain agents—as in the production of chloroform narcosis—this precursory stage is capable of being much abbreviated, if not altogether annihilated; while with other agents—as tea—the narcotic stage is by no means always or readily produced. It is well to remember, also, that there is not a shadow of proof that the moderate use of any one of these agents as a stimulant has any definite tendency to lead to its abuse; it is otherwise with their employment as narcotics, which, once indulged in, is almost certain to lead to repetition, and to a more or less rapid process of degradation, but there are many exceptions to this latter statement. In regard to this matter it is interesting to know that opium, which, used in excess, is one of the most deleterious of these stimulants, is employed by 400,000,000, or nearly one-third of the whole human race, and that among these we have the Chinese, who almost to a man are opium smokers, and who nevertheless are well known to be one of the most frugal and industrious of peoples, “powerful, muscular, and athletic, and the lower orders more intelligent, and far superior in mental acquirements, to those of corresponding rank in our own country.” It is also interesting to know that a late judge who lived to nearly ninety years of age believed he had prolonged his life and added greatly to his comfort by the moderate use of ether, which he was led to employ because neither wine nor tobacco agreed with him; while the immoderate use of the same agent has—particularly of late, and in the north of Ireland—given rise to a most deleterious form of drunkenness. And, however degrading, demoralizing, and pauperizing the vice of drunkenness may be, it is important to remember in all our thoughts concerning it, that it is the outcome of a craving innate in human nature, whether civilized or savage, and that there has been no period in the world’s history, and no nation on its surface, in which one or other, and often several simultaneously, of the many natural or artificial nerve stimulants have not been employed, and well it has been for those who have used them moderately. Two great influences have been regarded as of importance in regulating the prevalence of intemperance—temperature and race. Of these unquestionably race is by far the most influential. Within the isothermal lines of 77° Fahr. north and south of the equatorial line of 82° 4' Fahr. the wild native tribes seek

their happiness in a quiet introspective self-complacency termed *keyfi*, induced by opium or hashisch. Between the isothermal lines of 77° Fahr. and 50° Fahr. north and south lie those regions where the grape-vine grows luxuriantly, and in these riotous intemperance, though still comparatively rare, is no longer regarded as the disgraceful social crime it is looked on in the tropics; while beyond the isotherms of 50° Fahr. north and south the vine is no longer grown, and the stronger beers and distilled spirits become the wide-spread sources of a deeper intoxication, which too often terminates in crime, a result almost unknown in southern latitudes. How much of this is actually due to the more highly intoxicating qualities of the fluids imbibed, and how much to what Parry would rightly have termed the intoxicating quality of the climate, has never been fairly ascertained; but this much is known, that in these northern climes what is merely a stimulant dose in moderate weather becomes stupefying under the influence of cold;—not because cold increases the intoxicating power of any liquor, but because the previous excitement of the cerebro-spinal system produces a condition of functional exhaustion which makes it more readily succumb to the benumbing influence of cold,—renders it, as we say, more liable to become morbidly congested by the reflex action of cold applied to the surface.

But of the two great influences which regulate the prevalence of intemperance, that of race far exceeds that of temperature. A glance at the map of the world, coupled with some knowledge of its history, teaches us that, whether in temperate, subtropical, or tropical regions, wherever the Teuton is, there drunkenness prevails; and the wild orgies in which Tacitus tells us the Teuton of his day indulged in the cold climate of northern Europe are reproduced with wonderful circumstantiality irrespective of climate or temperature. It may be, as a recent speaker has said, that “a national love for strong drink is a characteristic of the nobler and more energetic populations of the world;” it may be, as he goes on to say, that it “accompanies public and private enterprise, constancy of purpose, liberality of thought, and aptitude for war; it,” as he further adds, “exhibits itself prominently in strong and nervous constitutions, and assumes in very many instances the character of a curative of itself.” In other words, in certain constitutions the moderate use of stimulants excites to action rather than to a sensual *keyfi*, and the pleasurable stimulus of action renders such individuals less likely to fall into degrading habits of excess.

The effects of intoxicants are variously modified by the temperament of the individual and the nature of the inebriant. When that is alcohol, its action on an average individual is first to fill him with a serene and perfect self-complacency. His feelings and faculties are exalted into a state of great activity and buoyancy, so that his language becomes enthusiastic, and his conversation vivacious if not brilliant. The senses gradually become hazy, a soft humming seems to fill the pauses of the conversation, and modify the tones of the speaker, a filmy haze obscures the vision, the head seems lighter than usual, the equilibrium unstable. By and by objects appear double, or flit confusedly before the eyes; judgment is abolished, secretiveness annihilated, and the drunkard pours forth all that is within him with unrestrained communicativeness; he becomes boisterous, ridiculous, and sinks at length into a mere animal. Every one around him, the very houses, trees, even the earth itself, seem drunken and unstable, he alone sober, till at last the final stage is reached, and he falls on the ground insensible—*dead drunk*—a state from which, after profound slumber, he at last awakes feverish, exhausted, sick, and giddy, with ringing ears, a throbbing heart, and a violent headache.

The *poison* primarily affects the cerebral lobes, and the other parts of cerebro-spinal system are consecutively involved, till in the state of *dead-drunkenness* the only parts not invaded by a benumbing paralysis are those automatic centres in the medulla oblongata, which regulate and maintain the circulation and respiration. But even these centres are not unaffected; the paralysis of these as of the other sections of the cerebro-spinal system varies in its incompleteness, and at times becomes complete, the coma of drunkenness terminating in death. More usually the intoxicant is gradually eliminated, and the individual restored to consciousness, a consciousness disturbed by the secondary results of the agent he has abused, and which vary with the nature of that agent. Whether, however, directly or indirectly, through the nervous system the stomach suffers in every case; thus nutrition is interfered with by the defective ingestion of food, as well as by the mal-assimilation of that which is ingested; and from this cause, as well as by the peculiar local action of the various poisons, we have the various organic degenerations induced which in most cases shorten the drunkard's days.

The primary discomforts of an act of drunkenness are readily removed for the time by a repetition of the cause. Thus what has been an act may readily become a habit, all the more readily that each repetition more and more enfeebles both the will and the judgment, till they become utterly unfit to resist the temptation to indulgence supplied by the knowledge of the temporary relief to suffering which is sure to follow, and in spite of the consciousness that each repetition of the act only forges their chains more tightly. From this condition there is no hope of relief but in enforced abstinence; any one in this condition must be regarded as temporarily insane, and ought to be placed in an inebriate asylum till he regain sufficient self-control to enable him to overcome his love for drink. The desire for stimulants is one of the strongest instincts of human nature. It cannot be annihilated, but may be regulated by reason, conscience, education, or by law when it encroaches on the rights of others or is injurious to the individual himself. By the Intoxicating Liquors Licensing Act of 1872 any one found drunk on a highway or public place or in a licensed house is liable to a fine of 10s., on a repetition of the offence within twelve months to one of 20s., and on a third offence within twelve months to one of 40s. To be drunk or riotous, or to be drunk while in charge of a horse, a carriage, or a gun is punishable with a fine of 20s. or imprisonment for one month. And by the Police and Improvement Act of Scotland, 25 and 26 Vict. c. 101, § 254, persons found drunk on the streets are subject to a fine of 40s. or 14 days' imprisonment, wherever that Act has been adopted. These Acts, properly enforced, ought to restrain the public exhibitions of drunkenness; while for those seasoned casks who ruin their own health and pauperize their families, without perhaps ever appearing in public offensively drunk, the only remedy which appears to promise hope of reform would seem to be the power of temporarily consigning them to an inebriate asylum. (G. W. B.)

DRUSES, a people of Syria remarkable for the pertinacity and success with which they have defended their independence against the encroachments of Turkish supremacy, and for the profession of a form of religious belief, which, in the words of Dean Milman, is "one of the most extraordinary aberrations which ever extensively affected the mind of man." The greater body, whom for the sake of convenience we shall distinguish as the Western Druses, occupy the mountainous region of the Lebanon and Anti-Lebanon; but there are also extensive settlements in the Hauran or Auranitis; a considerable colony exists at Safed, in Palestine proper, to the north-west of the Sea of Tiberias; and it is believed that a number of

Crypto-Druses—Druses, however, by religion only, and not by race—still maintain themselves in the neighbourhood of Cairo. The Western Druses are found as far north as Beyrout, as far south as Sur or Tyre, and as far east as Damascus; in the north they are intermingled with Maronites, and in the south with Greeks and Melchites. They form the exclusive population of about 120 towns and villages, and share with the Christians the occupation of nearly 230 more; their total number, not reckoning women and children, has been calculated at from 60,000 to 65,000 men. The chief town of the district which they occupy, though not their most populous settlement, is Deir-el-Kamar—the Convent of the Moon—situated about 15 miles south-east of Beyrout, in the district of Manaasif; it was the seat of the powerful family of the Abu Nekads, and in its vicinity is the palace of Ebteddin, formerly occupied by the emir Beshir Shehaab. Ammatam and Bakhlin in the Lebanon, and Hasbeya and Rosheya in the Anti-Lebanon, rank as sacred cities, and serve as rallying-points in time of war.

The Eastern or Hauranitic Druses are less known, and preserve their ancient customs and characteristics perhaps more perfectly than their western brethren. The date at which they first settled in the district is not ascertained; but for many generations the Hauran has been the chosen refuge of rebels and malcontents from the west, and has consequently increased its population at the expense of the Lebanon. The same process of emigration is still going on; and the Turkish Government has to be careful not to press too heavily on the defaulting Druse of the west, lest it needlessly augment the power of the more independent community. The number in the Hauran was stated by Cyril Graham at 7000 men in 1857; at present it must be much nearer 10,000. The principal town is Kunawat, the residence of the most influential of the Ockals.

In many respects the Druses are a mysterious people, and, in spite of the great additions made to our knowledge in the present century, many important questions in regard to them still await solution. Of their origin and ethnographical affinity no absolutely certain information has been obtained. Though they speak Arabic with a correctness that would do credit to the people of Mecca, and their feudal aristocracy refer to their Arab descent with feelings of pride, it is pretty generally agreed that, whatever may be true of certain families, the main body of the people does not belong to the Semitic family. Mr Cyril Graham regards them as of Indo-Teutonic race, and describes them as "fair-haired, of light complexion, strong and well-made, and often as tall as northern Europeans." Their own tradition vaguely connects them with China, where they firmly believe that to this day there exist numerous adherents of their creed, and whence they expect the advent of their promised deliverer. The mere fact that they possess a knowledge of the Celestial Empire in such contrast to the geographical ignorance of the other Syrian races is in itself remarkable enough; though it would be rash to assert that it is practically significant. According to an opinion mentioned by Sandys, and pretty often to be met with in the older accounts, they derive their name from a count of Dreux, and are mainly the descendants of a band of the crusaders who were left behind, and finally forgot their country and language and creed; but this story is disproved by the fact that allusion is made to their existence at an earlier date by Benjamin of Tudela.

A more modern theory identifies them with one or other of the tribes introduced into Northern Syria by Esarhaddon in the 7th century B.C. If its generally but not universally received derivation from Ismael Darazi be accepted, their present name, which is properly Durus, dates no further back than about the 11th century, and throws

no light on the question of affinity; and just as little is to be learned from the various explanations current among themselves—those *put in possession* (of the faith), from the Arabic verb *darasa*; those who *read* the book of Hamze, as if from *darasa*, the *clever ones*, from *Durs*; the *shields*, from *Turs*, and so on. It is well known, however, that the district which they now occupy has over and again received extraneous additions to its population; and, in the absence of more precise information, it seems at least certain that, whatever may have been the original nucleus of his race, the Druse of the present day carries in his veins the mingled blood of a various ancestry, in like manner as his religion combines the products of many different intellectual moments. The presence of a Kurdish element is undoubted, and its influence may probably be traced in the peculiar position granted to the women.¹

The rise and progress of the religion which gives unity to the race can be stated with considerable precision. As a system of thought it may be traced back in some of its leading principles to the Shiite sect of the Batenians, or Batiniya, whose main doctrine was that "every outer has its inner, and every passage in the Koran an allegorical sense," and to the Karamatians, or Karamita, who pushed this method to its furthest limits; as a creed it is somewhat more recent. In the year 386 A.H. (996 A.D.) Hakim Biamrillahi (i.e., he who judges by the command of God), the sixth of the Fatimite caliphs, began to reign; and during the next twenty-five years he indulged in a tyranny at once so terrible and so fantastic that little doubt can be entertained of his insanity. As madmen sometimes do, he believed that he held direct intercourse with the deity, or even that he was an incarnation of the divine intelligence; and in 407 A.H., or 1016 A.D., his claims were made known in the mosque at Cairo, and supported by the testimony of Ismael Darazi. The people showed such bitter hostility to the new gospel that Darazi was compelled to seek safety in flight; but even in absence he was faithful to his god, and succeeded in winning over the ignorant inhabitants of Lebanon. According to Druse authority this great conversion took place in the year 410 A.H. Meanwhile the endeavours of the caliph to get his divinity acknowledged by the people of Cairo continued. The advocacy of Hasan ben Haidara Fergani was without avail; but in 408 A.H. the new religion found a more successful apostle in the person of Hamze ben Ali ben Ahmed, a Persian mystic, feltmaker by trade, who became Hakim's vizier, gave form and substance to his creed, and by his ingenious adaptation of its various dogmas to the prejudices of existing sects finally enlisted an extensive body of adherents. In 411 the caliph was assassinated by contrivance of his sister Sitt Almulk but it was given out by Hamze that he had only withdrawn for a season, and his followers were encouraged to look forward with confidence to his triumphant return. Darazi, who had acted independently in his apostolate, was branded by Hamze as a heretic, and thus, by a curious anomaly, he is actually held in detestation by the very sect which probably bears his name. The propagation of the faith, in accordance with Hamze's initiation, was undertaken by Ismael Ben Muhammed *Temimi*, Muhammed ben *Wahab*, Abulkhair *Selama* ben Abdalwahab ben Samurri, and Moktana Bohaeddin, the last of whom was known by his writings from Constantinople to the borders of India. In two letters addressed to the emperor Constantine VIII. and Michael the Paphlagonian he endeavours to prove that the Christian Messiah reappeared in the person of Hamze.

The full exposition of the Drusean creed thus brought into existence, even in the somewhat imperfect state of

European knowledge in regard to many of its details, would require a volume of considerable size: the following is a summary of its main doctrines. The Muahhidin or Unitarians, as the Druses call themselves, believe that there is one and only one God, indefinable, incomprehensible, ineffable, passionless. He has made himself known to men by ten successive incarnations in the persons of Ali, Albar, Alya, Moill, Kaim, Moezz, Ariz, Abu Zechariah, Mansur, and Hakim. No further incarnation can take place: in Hakim a final appeal was made to mankind, and after the door of mercy had stood open to all for twenty-six years, it was finally and for ever closed. When the tribulation of the faithful has reached its height, Hakim will reappear to conquer the world and render his religion supreme. The first of the creatures of God is the Universal Intelligence, impersonated in Hamze at the time of the last incarnation; he is the creator of all subordinate beings, and he alone has immediate communion with the Deity. Next in rank to him, and along with him supporting the throne of the Almighty, are four archangels, the Soul, the Word, the Right Wing, and the Left Wing, who were embodied respectively in Ismael Darazi, Mohammed ben Wahab, Selama ben Abdalwahab, and Bohaeddin; and beneath these again are spiritual agents of various ranks. The number of human beings admits neither of increase nor of decrease, and a regular process of metempsychosis is maintained. The souls of the virtuous pass after death into the bodies of Chinese Druses; those of the wicked may be degraded to the level of camels or dogs. All previous religions are mere types of the true, and their sacred books and observances are to be interpreted allegorically. As the admission of converts is no longer permitted, the faithful are enjoined to keep their doctrines secret from the profane; and in order that their allegiance may not bring them into danger, they are allowed to make outward profession of whatever religion is dominant around them. To this latter indulgence is to be attributed the apparent indifference with which they join the Mahometan in his prayers and ablutions, or sprinkle themselves with holy water in the Maronite churches. Obedience is required to the seven great commandments of Hamze, the first—greatest of which enjoins truth in words (but only of D towards Druse); the second, watchfulness over the souls of the brethren; the third, absolute renunciation of other religion; the fourth, complete separation from who are in error; the fifth, recognition of the one "Our Lord" in all ages; the sixth, complete resignation to his will; and the seventh, complete obedience to his orders. Prayer, however, is regarded as an imperious interference with the Creator; while at the same time, freedom of the human will is distinctly maintained. It is the charge of secrecy rigidly obeyed in regard to the alien world, but full initiation into the deeper secrets of the creed is permitted only to a special class—nominated Ockals or Akals—probably from the Arabic intelligence—in contradistinction from whom all members of the Druse community, whatever may be their position or attainments, are called Djahel or Ignorant. About 15 per cent. of the adult population belong to order. Admission is granted to any Druse of either sex who expresses willingness to conform to the laws of the society, and during a year of probation gives sufficient proof of sincerity and stability of purpose. There appears to be no formal distinction of rank among the various members; and though the emir Beshir Shehaab used to appoint a sheik of the Ockals, the person thus distinguished obtained no primacy over his fellows. Exceptional influence depends on exceptional sanctity or ability. All are required to abstain from tobacco and wine; the women are

¹ Cf. Lord Carnarvon's suggestive account of the Yazidis.

to wear neither gold nor silver, nor silk, nor brocade; and although neither celibacy nor retirement from the affairs of the world is either imperative or customary, unusual respect is shown to those who voluntarily submit themselves to ascetic discipline. While the Ockals mingle frankly with the common people, and are remarkably free from what in Europe would be called clerical pretension, they are none the less careful to maintain their privileges. They are distinguished by the wearing of a white turban, emblematic of the purity of their life. Their food must be purchased with money lawfully acquired; and lest they should unwittingly partake of any that is ceremonially unclean, they require those *djahels* whose hospitality they share to supply their wants from a store set apart for their exclusive use. The ideal Ockal is grave, calm, and dignified, with an infinite capacity of keeping a secret, and a devotion that knows no limits to the interests of his creed. On Thursday evening, the commencement of the weekly day of rest, the members of the order meet together in the various districts, probably for the reading of their sacred books and consultation on matters of ecclesiastical or political importance. Their meeting-houses, *kolourés*, *halwes*, or *khalwas*, are plain, unornamented edifices, usually built in secluded spots, and not unfrequently on isolated eminences. "All have property attached to them, the revenues of which are consecrated to the relief of the poor and the demands of hospitality. In one at Necha, in the Shoof, a lamp is kept burning night and day."¹ Even while the Ockals are assembled, strangers are readily enough admitted to the *kolourés*; but as long as they are present the ordinary ceremonies are neglected, and the Koran takes the place of the Drusian scriptures. It has been frequently asserted that the image of a calf is kept in a niche, and traces of phallic and gynæcocratic worship have been vaguely suspected; but there is no authentic information in support of either statement. The calf, if calf there be, is probably a symbol of the execrable heresy of Darazi, who is frequently styled the calf by his orthodox opponents. Ignorance is the mother of suspicion as well as of devotion; and accordingly the Christian inhabitants of the Lebanon have long been persuaded that the Druses in their secret assemblies are guilty of the most nefarious practices. Of the allegation, so frequently repeated by European writers, that seems to be little evidence; and it is certain that the drunken books of the religion inculcate what is on the whole a dark-toned morality. Colonel Churchill, in his last prison, asserts that while the majority of the people follow the teaching of Bohaeddin, there still exists a party person indulges in the "dark and unscrupulous libertinism of the Darazi."

Druses, like the Arabs, have a high reputation for hospitality, and they give special welcome to the English, whom they regard as their particular friends and allies. Their *far* presents himself at their door in the quality of offensive, or passenger is sure of being entertained with hope of lodging in the most generous manner. Volney saw the lowest peasants give their last morsel of bread to a hungry traveller; and their only answer to the and of imprudence was, "God is great and liberal, and all men are brethren." Beggary at the same time is altogether unknown among the common people, and the Ockals are not a mendicant order. It would be easy to illustrate by many a striking incident the fidelity with which they keep inviolate the pledge tacitly given to the guest who has eaten of their bread and salt. Nor is their hospitality unassociated with other virtues. "There was nothing," says Lord Carnarvon, "which surprised me more than the self-possession, the delicate appreciation of wishes and feel-

ings, the social ease, and to a great extent the refinement which distinguished the conversation and manners of those amongst the Druse chiefs whom I then met, and on which no drawing-room of London or Paris could have conferred an additional polish;" and a similar testimony is borne by Mr Chasseand, who was brought up in the city of Beyrout, and had abundant opportunities of observation. There is a darker side, indeed, to the picture; though, after all, while his merits are in the main peculiarly his own, the Druse only gives additional intensity to the ruthlessness and revengefulness of so many of the Eastern nations.

Polygamy is not permitted. Among the old fædal families intermarriage is often restricted to one or two houses; and the daughter of a sheik will rather remain a virgin than bring disgrace on her blood by a *mésalliance*. The marriage of near relations is naturally the consequence; but, whatever may have been formerly the case, it no longer appears to be the custom for brother and sister to wed. All prenuptial arrangements on the part of the woman are conducted by the father, who cannot act, however, without her consent. On the wedding day a number of Ockals and a few of the bridegroom's relations go to the bride's house; the marriage contract is drawn up and read; and the bride, completely enveloped in a veil, is led off on horseback to her husband, accompanied by her friends, both male and female. As she approaches her future home, the bridegroom's party sallies forth, and a mock contest, with blank cartridge, ensues. Ultimately the bride is successful; shouts of welcome follow her into the harem, where she is received and caressed by the women of her husband's family. After a little she is left alone; the bridegroom enters, lifts her veil, takes his first glance at his wife, replaces it, and withdraws. The revels continue for several days.² Divorce is freely allowed; but when once obtained it cannot be cancelled, though either party is free to marry again. Births are rarely celebrated with any public or private jubilation. When a sheik dies, all the sheiks in the mountain are at once informed. Next day they assemble, and the dead body is borne forth in an open coffin to meet all those whom it is especially wished to honour. All day long the mourners walk up and down the medan, or tilt-yard, in parties of fifty and sixty, singing or reciting eulogy or dirge; and every now and then a number rush into the "lichroom" and kiss the dead man's hands and face and beard. A little before sunset the burial takes place. The women watch afar off, while the men follow silently to the grave. A few passages from the Koran are read by the Ockals, and the ceremony is over. The family mausoleums are built without doorways, and the wall has to be broken down to admit each new tenant. Those who die in the odour of sanctity are buried in their own houses: the tomb is in the form of an altar, and stands east and west, and the body is laid on its side with the face looking to the south.³

Education, according to Eastern ideas, receives considerable attention among the Druses; and all their ladies, in contrast to the majority of their countrywomen, can both read and write. The defence and the diffusion of their religion were originally undertaken in great measure by means of little books or treatises; and from an early period several of the wealthier sheiks have prided themselves on their collection of manuscripts. For a people so small in number, their literature, though almost purely theological, is remarkably extensive—a fact which may probably be ascribed to the influence of the Semitic element. In spite of the excessive care with which their manuscripts have been guarded (and they are enjoined if need be to kill any alien found in possession of their sacred books), a considerable

number, undoubtedly genuine, have found their way to Europe. A copy of the *Book of the Testimonies to the Mysteries of the Unity*, consisting of seventy treatises in four folio volumes, was found in the house of the chief Ockal at Bakhlin, and presented in 1700 to Louis XIV. by Nusralla Ibn Gilda, a Syrian doctor. Other manuscripts are to be found at Rome in the Vatican, at Oxford in the Bodleian, at Vienna, at Leyden, at Upsala, and at Munich; and Dr Porter got possession of the seven standard works of Druse theology while at Damascus. The Munich collection was presented to the king of Bavaria by Clotbey, the chief physician in the Egyptian army during its occupation of Syria, and for a number of the other manuscripts we are indebted to the elder Niebuhr. A history of the Druse nationality by the emir Haider Shehaab is quoted by Urquhart.

From an early period, the internal organization of the Druses has been constructed after a patriarcho-federal type, which, as usual, has placed a large amount of arbitrary power in the hands of the chiefs or sheiks, and given rise to an endless succession of petty feuds and confederations between the various clans or families. Into the picturesque confusion of the resulting history, complicated as it is by Turkish encroachments and intrigue, it would be useless to enter, and the curiosity of the reader may easily be gratified by turning to Colonel Churchill's interesting, if somewhat diffuse and desultory, volumes. The following, however, may be mentioned as among the most important of the clans, which at one period or other have acquired an influential position in the Lebanon:—The Tnoohs or Tanuchs, now extinct, who had their seat at Abeigh or Obeah, in the Shaheer, a short distance to the S. of the Bahr Beyront; the Talhook family, originally the Beni Hazamm, one branch of which has its principal residence at Heittat, and the other at Allaye, about nine and ten miles respectively S. E. of Beyrout; the Abdelmeliks with their seat at Ebtater, about four miles E. of Heittat; the Cadis of Bisoor, nearly two miles to S. of Heittat, an offshoot of the Tnoohs; the house of Raslan with its seat at Shwyfat, seven miles S. of Beyrout; Aminadins, now settled at Abeigh, remarkable for their attention to religion; the house of Jumblatt or Djembelat with its splendid mansion at Mne-tarn on the eastern bank of the Nahr-el-Awleh, the Abn-Nekads, formerly the feudal lords of Deir-el-Kamar; the house of Abu-Harmoosh, the Amads, and the Eids.

The Druses first attained to pre-eminence in the Lebanon under the presidency of the Arab family of the Tnoohs, which had adopted the doctrines of Hamze. For a long time they continued to be tolerated as serviceable allies by the orthodox Mahometans, and the Tnoohs even obtained possession of Beyrout; but about 1300, after Malek Ashraf had expelled the Christians from Syria, he turned his attention to the Lebanon and ordered the Druses to erect mosques throughout their territory. They refused, and prepared to defend themselves; but their forces were defeated at Ain-Sofar, about halfway between Beyrout and the Bekaa. A long period of peace ensued, and while acknowledging the supremacy of the Sultan of Egypt, the Druses attained considerable importance. An impetus was given to their religion by the emir Jemaladin Said Abdallah Tnoohi (d. 1480), whose shrine at Abeigh is still visited by pious pilgrims.

On the defeat of the Egyptian sultan by the Ottoman invader Selim I., in 1517, the Druses were obliged to submit to the new dynasty, which bestowed the chief power in the Lebanon on Fakaradin-Maan, a member of a Mohometan family originally known as the Beni-Rabna, who had immigrated from the Nahran about 1145. The family of the Tnoohs which had already been destroyed by internal feuds, was thrown into the shade and never recovered its position. In the early part of the 17th century, the interest of European nations was excited in the fate of the emir Fakaradin Maan II., who on the failure of his plans sought refuge for a time with the grand duke of Tuscany and the king of Naples, but ultimately perished by the bow-string in the city of the sultans. His family died out in the beginning of the 18th century, and the position of Grand Emir was bestowed on a member of the house of Shehaab, originally a branch of the Beni Koreish of Mecca. In 1713 the emir Haider Shehaab, having routed the Turkish forces at Aindara with the assistance of the sheiks of the Cadis, Abn-Nekads, Abi-el-Meliks, and Talhooks, immediately afterwards divided the whole of the southern Lebanon into territorial districts, and bestowed the administration on the chiefs to whom he had been principally indebted. Each *macaatagee* thus created had full power of taxation and punishment over the district entrusted to him by his *macaata* or contract; and the system thus instituted continued in force till its abolition by Foad Pasha in 1860. The events of the next hundred years—full as those years were of revolutions and counter-revolutions in which the Druses

had ample share—belong rather to the general history of the Lebanon than to the special history of the Druses. The latter part of the period is occupied by the life of the emir Beshir Shehaab, undoubtedly one of the most remarkable men who ever fought and intrigued in Syria. In 1799, along with many of the Druses, he accepted the advances of Sir Sidney Smith, and swore perpetual hostility against the French, who were, however, soon after driven back to Egypt without his assistance; and in 1823 his co-operation, though only supported by the half-hearted acquiescence of most of the sheiks, was of the greatest service to the cause of Ibrahim Pasha against the Turks. Not long after the restoration of the authority of the Porte, which in spite of their emir had been considerably furthered by the Druse sheiks, the peaceful relations which from time immemorial had existed between the Druses and the Maronites gradually gave place to the bitterest hostility. Under the patronage of the next emir, Beshir el Kassim (himself a proselyte to their religion), and instigated by their patriarch and priest, the Maronites began to assert their independence of the Druse sheiks under whose feudal authority they were placed. Civil war broke out in 1841, and raged for three years. In January 1842 the Turkish Government appointed Omar Pasha as administrator of the Druses and Maronites, with a council of four chiefs from each party, but the pasha attempting to effect a disarming, was in November besieged in the castle of Beit-ed-din by the Druses under Shibli-el-Arrian. At the instigation of the European powers he was recalled in December, and the Druses and Maronites were placed under separate *kaimakams* or governors. Disturbances again broke out in 1845 the Maronites flew to arms, but with the assistance of the Turks their opponents carried the day. A superficial pacification effected by Sheik Effendi, the Ottoman commissioner, lasted only till his departure; and the Porte was obliged to dispatch a force of 12,000 men to the Lebanon. Forty of the sheiks were seized and the people nominally disarmed; and in 1846 a new constitution was inaugurated by which the *kaimakam* was to be assisted by two Druses, two Maronites, four Greeks, two Turks, and one Metuali. All, however, was in vain: the conflict was continued through 1858, 1859, and 1860; the Druses plundered and massacred, and the Turkish soldiers looked on or even assisted in the bloody work. At Damascus even the Christians were slain in thousands, and the remnant was only saved by Abdel-Kader's magnanimous protection. The European powers now determined to interfere; and by a protocol of the 3d of May it was decided that the Lebanon should be occupied by a force of 20,000 men, of whom the half were to be French. A body of troops was accordingly landed on the 16th of August under General Beaufort d'Hautpoul; and Foad Pasha, who had been appointed Turkish commissioner with full powers, proceeded to bring the leaders of the massacres to justice. An international commission met at Beyrout on the 5th October; but the Turks connived at the escape of culprits, the members could not come to agreement, and the proceedings were practically stultified. The French occupation continued till 6th June 1861, and the French and English squadrons cruised on the coast for several months after. In accordance with the recommendation of the European powers the Porte determined to appoint a Christian governor not belonging to the district, and independent of the pasha of Beyrout, to hold office for three years. The choice fell on Dand Pasha, a Catholic Armenian, who was installed on 4th of July. In spite of many difficulties, and especially the ambitious conduct of the Maronite Jussuf Karam, he succeeded in restoring order; and by the formation of a military force from the inhabitants of the Lebanon he rendered unnecessary the presence of the Turkish soldiery. He was reappointed for five years at the close of his first term; and his administration seems to have effected a permanent pacification.

DRUSIUS, or VAN DEN DRIESCHE, JOHANNES (1550–1616), a learned Protestant divine, distinguished specially as an Orientalist and exegete, was born at Oudenarde, in Flanders, on the 28th June 1550. Being designed for the

church, he studied Greek and Latin at Ghent, and philosophy at Louvain; but his father having been outlawed for his religion, and deprived of his estate, retired to England, where the son followed him in 1567. He found an admirable teacher of Hebrew in Chevalier, the celebrated Orientalist, with whom he resided for some time at Cambridge. In 1572 he became professor of Oriental languages at Oxford. Upon the pacification of Ghent (1576) he returned with his father to their own country, and was appointed professor of Oriental languages at Leyden in the following year. In 1585 he removed to Friesland, and was admitted professor of Hebrew in the university of Franeker, an office which he discharged with great honour till his death, which happened in February 1616. He acquired so extended a reputation as a professor that his class was frequented by students from all the Protestant countries of Europe. His works prove him to have been well skilled in Hebrew and in Jewish antiquities; and in 1600 the States-general employed him, at a salary of 400 florins a year, to write notes on the most difficult passages in the Old Testament; but, as he was frequently interrupted in prosecuting this undertaking, it was not published until after his death. As the friend of Arminius, he was charged by the orthodox and dominant party with unfairness in the execution of this task, and the last sixteen years of his life were, therefore, somewhat embittered by controversy. He carried on an extensive correspondence with the learned in different countries: for, beside letters in Hebrew, Greek, and other languages, there were found amongst his papers upwards of 2000 written in Latin. He had a son, John, who died in England at the age of twenty-one, and was accounted a prodigy of learning. He had mastered Hebrew at the age of nine, and Scaliger said that he was a better Hebrew scholar than his father. He wrote a large number of letters in Hebrew, besides notes on the Proverbs of Solomon and other works.

Paquot states the number of the printed works and treatises of the elder Drusus at forty-eight, and of the unprinted at upwards of twenty. Of the former more than two-thirds were inserted in the collection entitled *Critici Sacri, sive Annotata doctissimorum Virorum in Vetus et Novum Testamentum* (Amsterdam, 1698, in 9 vols. folio, or London, 1660, in 10 vols. folio.) Amongst the works of Drusus not to be found in this collection may be mentioned—1. *Alphabetum Hebraicum vetus*, (1584, 4to); 2. *Tabula in Grammaticam Chaldaicam ad usum Juventutis*, (1602, 8vo); 3. An edition of *Sulpicius Severus* (Franeker, 1807, 12mo); 4. *Opuscula quæ ad Grammaticam spectant omnia*, (1609, 4to); 5. *Lacrymæ in obitum J. Scaligeri*, (1609, 4to); and 6. *Grammatica Linguae Sanctæ novæ* (1612, 4to.)

DRUSUS, MARCUS LIVIUS, a patrician of the age of the Gracchi, and a colleague of Caius Gracchus in the tribuneship, 122 B.C. He was a creature of the senatorial party, and was employed by them to outbid the measures of the popular tribune. Gracchus had proposed to found three colonies outside Italy; Drusus provided twelve in Italy. Gracchus had proposed to distribute allotments to the poorer citizens subject to a state rent-charge; Drusus promised them free of all charge. Gracchus had proposed to give the Latins the citizenship; Drusus added immunity from corporal punishment, even in the field. The bait thus offered was swallowed; the people forsook their champion, who fell an easy victim to the hired bravos of Opimius. Drusus was rewarded for his services by the consulship, which he held, 112 B.C. He received Macedonia for his province, where he distinguished himself in a campaign against the Scordisci, whom he drove across the Danube into Dacia, being the first Roman general who reached that river. It is probable that he is the Drusus mentioned by Plutarch as having died in the year of his censorship, 109 B.C.

DRUSUS, MARCUS LIVIUS, son of the preceding, and, like his father, during the first part of his career a thorough supporter of the optimates. From his earliest youth he

devoted himself to politics, was assiduous as a pleader in the law-courts, and lavished in gifts and shows the large fortune which he had inherited. By such popular acts he rose to be tribune of the people, 91 B.C. In the agitation which was then raging for the transfer of the judicial functions from the equites to the senate, he proposed as a compromise a measure which restored to the senate their office of judges, while the numbers were doubled by the admission of 300 equites. But the senate was lukewarm, and the knights whose occupation was threatened offered the most violent opposition. In order, therefore, to catch the popular votes, he coupled with this measure others for the establishment of colonies in Italy and Sicily, and the distribution of corn at a reduced rate. By help of these riders the bill was carried, but not till its most factious opponent, the consul Philippus, had been arrested by Drusus and carried off to prison. To strengthen his hands Drusus now sought a closer alliance with the Italians, promising them the long coveted boon of the Roman franchise. The senate, who had before suspected his aims, broke out into open opposition. His laws were abrogated as informal, and each party armed its adherents for the civil struggle which was now inevitable. It was only prevented, or rather postponed, by the assassination of Drusus. One evening as he was returning to his house he was struck by a dagger, and fell at the foot of his father's bust, exclaiming with his dying breath, "When will the republic find again a citizen like me?" His character is hard to decipher, and is one of the moot problems of Roman history. To some he has appeared an unscrupulous adventurer, who deserted his own order to gratify his selfish ambition; others have pronounced him the ablest and wisest of the Roman demagogues. That he was proud and ambitious there can be no question. When a quaestor in Asia he refuses to wear the robes of office, "ne quid ipso esset insignis." When summoned before the senate he bids them come to him—"they will find me in the Curia Hostilia"—and they came. No less certain is it that the reforms he advocated were, on the whole, salutary and needful. The corruption of the equites was flagrant; the claims of the Italians to the franchise were just and pressing. Drusus was the Mirabeau of the social revolution of Rome, and had his measures been carried Rome might have been spared the most terrible of her civil wars.

DRYADES, or HAMADRYADES, in Greek Mythology, were nymphs of trees and woods, each particular tree or wood being the habitation of its own special Dryad, just as each river was the abode of its own local god. From being so closely identified with trees, the Dryades came to be thought of as having been, like the trees, produced from the earth, as Hesiod says, *Theog.*, 129.

DRYANDER, JONAS (1748–1810), a Swedish naturalist of eminence, and a pupil of Linnæus, was born in 1748. By his uncle, Dr Lars Montin, to whom his education was intrusted, he was sent to the university of Gottenburg, whence he removed to Lund. After taking his degree there in 1776, he studied at Upsala, and then became for a time tutor to a young Swedish nobleman. He next visited England, and, on the death of his friend Dr Solander in 1782, he succeeded him as librarian to Sir Joseph Banks. He was librarian to the Royal Society and also to the Linnean Society. Of the latter, in 1788, he was one of the first founders, and, when it was incorporated by royal charter in 1802, he was chiefly concerned in the drawing up of its laws and regulations. He was vice-president of the society till the time of his death, which took place in October 1810.

Besides papers in the Transactions of the Linnean and other societies, Dryander published *Dissertatio gradualis Fungos Regno Vegetabili vindicans*, Lond 1776, and *Catalogus Bibliothecæ Historico-Naturalis Josephi Banks, Bart.*, Lond 1796–1800, 5 vols. He also edited the first and part of the second edition of Arton's *Hortus Ewensis*, and Roxburgh's *Plants of the Coast of Coromandel*.

DRYDEN, JOHN (1631-1700), the poet, born on the 9th of August 1631, at Aldwinkle, in Northamptonshire, was of Cumberland stock, though his family had been settled for three generations in Northamptonshire, had acquired estates and a baronetcy, and intermarried with landed families in that county. His great-grandfather, who first carried the name south, and acquired by marriage the estate of Canons Ashby, is said to have known Erasmus, and to have been so proud of the great scholar's friendship that he gave the name of Erasmus to his eldest son. The name Erasmus was borne by the poet's father, the third son of Sir Erasmus Dryden. The leanings and connections of the family were Puritan and anti-monarchical. Sir Erasmus Dryden went to prison rather than pay loan money to Charles I.: the poet's uncle, Sir John Dryden, and his father Erasmus, served on Government commissions during the Commonwealth. His mother's family, the Pickeringes, were still more prominent on the Puritan side. Sir Gilbert Pickering, his cousin, was chamberlain to the Protector, and was made a peer in 1658.

Dryden's education was such as became a scion of these respectable families of squires and rectors, among whom the chance contact with Erasmus had left a certain tradition of scholarship. His father, whose own fortune, added to his wife's, the daughter of the rector of Aldwinkle All Saints, was not large, and whose family, of whom the poet was the eldest, amounted to fourteen, procured him admission to Westminster School as a king's scholar, under the famous Dr Busby. Some elegiac verses which Dryden wrote there on the death of a young Lord Hastings, in 1649, had the distinction of being published in a volume called *Lacrymæ Musarum*, among other elegies by "divers persons of nobility and worth" in commemoration of the same event. He appeared soon after again in print, among writers of commendatory verses to a friend of his, John Hoddesdon, who published a little volume of religious poetry in 1650. Dryden's contribution is signed "John Dryden of Trinity C.," he having gone up from Westminster to Cambridge in May 1650. He was elected a scholar of Trinity on the Westminster foundation in October of the same year, and took his degree of B A in 1654. The only recorded incident of his college residence is some unexplained act of contumacy to the vice-master, for which he was "put out of commons" and "gated" for a fortnight. No inference can be built upon this as to Dryden's habits at the university. Contumacy to authorities was not a feature in his later life. His father died in 1654, leaving him master of two-thirds of a small estate near Blakesley, worth about £60 a year. The next three years he is said to have spent at Cambridge. It was then probably that he laid the foundation of that habit of learned discussion of literary methods which is so remarkable a feature in the prefaces to his plays and poems. Not content with doing a thing, like writers who are suddenly placed under the necessity of writing, Dryden must always be arguing as to how it ought to be done, pushing on argumentative justification in advance of execution. Whether or not he spent the three years before 1657 at Cambridge, there can be little doubt, judging from internal evidence, that he spent them somewhere in study; for his first considerable poem bears indisputable marks of scholarly habits, as well as of a command of verse that could not have been acquired without practice.

The middle of 1657 is given as the date of his leaving the university to take up his residence in London. In one of his many subsequent literary quarrels, it was said by Shadwell that he had been clerk to Sir Gilbert Pickering, his cousin, the favourite of Cromwell; and nothing could be more likely than that he obtained some employment under his powerful cousin when he came to London. He first

emerged from obscurity with his *Heroic Stanzas* to the memory of the Protector, who died September 3, 1658. That these stanzas should have made him a name as a poet does not appear surprising when we compare them with Waller's verses on the same occasion. Dryden took some time to consider them, and it was impossible that they should not give an impression of his intellectual strength. Donne was his model; it is obvious that both his ear and his imagination were saturated with Donne's elegiac strains when he wrote; yet when we look beneath the surface, we find unmistakable traces that the pupil was not without decided theories that ran counter to the practice of the master. It is plainly not by accident that each stanza contains one clear-cut brilliant point. The poem is an academic exercise, and it seems to be animated by an undercurrent of strong contumacious protest against the irregularities tolerated by the authorities. Dryden had studied the ancient classics for himself, and their method of uniformity and elaborate finish commended itself to his robust and orderly mind. In itself the poem is a magnificent tribute to the memory of Cromwell. Now that the glittering style of the so-called "metaphysical poets" has gone very far out of fashion, it requires an effort, a deliberate dismissal of prejudice, to enjoy such a poem. A poet writing now on such a man would present his grandeur in a much more direct and simple way. Yet judged in the spirit of its own style, Dryden's is a noble poem. The recognition of Cromwell's greatness is full and ample. The thought in each stanza, the inclosing design of each of the parts of the edifice, is massive and imposing, although the massiveness is not presented in its naked simplicity, so as to hold the foremost place in the eye—the gaze being arrested by glittering accidents, so that the essential grandeur of the mass is disguised and diminished. We are not invited to dwell upon the grand outline; we are not called upon to surrender ourselves to its simple impressiveness; but it is there, although the author does not insist upon it, and rather deprecates it, waves it off, and challenges our admiration of some artificial centre of attraction. It is the ornamental centre upon which the art of the poet has laboured, not the effect of the massive whole; still there is loftiness and nobility in the scope of the work, if our prejudices in favour of a less adorned workmanship permit us to feel it.

From a moral point of view, Dryden's next appearance as a poet is not creditable. To those who regard the poet as a seer with a sacred mission, and refuse the name altogether to a literary manufacturer to order, it comes with a certain shock to find Dryden, the hereditary Puritan, the panegyrist of Cromwell, hailing the return of King Charles in *Astræa Redux*, deploring his long absence, and proclaiming the despair with which he had seen "the rebel thrive, the loyal crost." From a literary point of view also, *Astræa Redux* is very inferior to the *Heroic Stanzas*; Dryden had need of Waller's clever excuse that it is easier to praise a bad man than a good, because the essence of poetry is fiction. And it was not merely in thus hastening to welcome the coming guest, and recant all praise of his rival, that Dryden showed a shamelessly accommodating spirit, and placed himself in such unpleasant contrast to the greater poet who was waiting his fate in all but friendless blindness. It might have been expected of one with his Puritan connections and scholarly training that, if he purposed making a living by the stage, which was restored with Charles, his literary as well as his moral conscience would have required him to make some effort to raise or at least not to lower its tone. But Dryden seems to have had no higher ambition than to make some money by his pen. He naturally first thought of tragedy,—his own genius, as he has informed us, inclining him rather to

that species of composition, and in the first year of the Restoration he wrote a tragedy on the fate of the duke of Guise. But some friends advised him that its construction was not suited to the requirements of the stage, so he put it aside, and used only one scene of the original play later on, when he again attempted the subject with a more practised hand. Having failed to write a suitable tragedy, he next turned his attention to comedy, although, as he admitted, he had little natural turn for it. He was very frank afterwards in explaining his reasons for writing comedy. "I confess," he said, in a short essay in his own defence, printed before *The Indian Emperor*, "my chief endeavours are to delight the age in which I live. If the humour of this be for low comedy, small accidents, and raillery, I will force my genius to obey it, though with more reputation I could write in verse. I know I am not so fitted by nature to write comedy; I want that gaiety of humour which is required to it. My conversation is slow and dull; my humour saturnine and reserved; in short, I am none of those who endeavour to break jests in company or make repartees. So that those who deery my comedies do me no injury, except it be in point of profit; reputation in them is the last thing to which I shall pretend." This, of course, was said by Dryden standing at bay; there was some bravado, but also a great deal of frank truth in it. He was really as well as ostentatiously a playwright; the age demanded comedies, and he endeavoured to supply the kind of comedy that the age demanded. His first attempt was unsuccessful. Bustle, intrigue, and coarsely humorous dialogue seemed to him to be part of the popular demand; and, looking about for a plot, he found something to suit him in a Spanish source, and wrote *The Wild Gallant*. The play was acted in February 1663, by Killigrew's company in Vere Street. It was not a success, although the most farcical incident received a certain interest and probability from a story which was current at the time. That a student, fresh from his library, trying to hit the taste of the groundlings with ribald farce, should make the ingredients too strong even for their palates, was but natural. Pepys showed good judgment in pronouncing the play "so poor a thing as ever I saw in my life." That such a play should be written by Dryden, and acted in by one of the daughters of Stephen Marshall, must have been a bitter thought for Puritanism at the time. Dryden never learned moderation in his humour; there is a student's clumsiness and extravagance in his indecency; the plays of Etherege, a man of the world, have not the uncouth riotousness of Dryden's. Of this he seems to have been conscious, for when the play was revived, in 1667, he complained in the epilogue of the difficulty of comic wit, and admitted the right of a common audience to judge of the wit's success. Dryden, indeed, took a lesson from the failure of *The Wild Gallant*; his next comedy, *The Rival Ladies*, also founded on a Spanish plot, produced before the end of 1663, was correctly described by Pepys as "a very innocent and most pretty witty play," though there was much in it which the taste of our time would consider indelicate. But he never quite conquered his tendency to extravagance. *The Wild Gallant* was not the only victim. *The Assignment, or Love in a Nunnery*, produced in 1673, shared the same fate; and even as late as 1680, when he had had twenty years' experience to guide him, *Limberham, or the Kind Keeper*, was prohibited, after three representations, as being too indecent for the stage. Dislike to indecency we are apt to think a somewhat ludicrous pretext to be made by Restoration playwrights, and probably there was some other reason for the sacrifice of *Limberham*; still there is a certain savageness in the spirit of Dryden's indecency which we do not find in his most licentious contemporaries. The undisciplined force

of the man carried him to an excess from which more dexterous writers held back.

After the production of *The Rival Ladies* in 1663, Dryden assisted Sir Robert Howard in the composition of a tragedy in heroic verse, *The Indian Queen*, produced with great splendour in January 1664. It was probably through this collaboration that Dryden made the acquaintance of Lady Elizabeth Howard, Sir Robert's sister, whom he married on the 1st of December 1663. Lady Elizabeth's reputation was somewhat compromised before this union, and, though she brought some small addition to the poet's income, she does not seem to have added to his happiness. *The Indian Queen* was a great success, one of the greatest since the reopening of the theatres. This was in all likelihood due much less to the heroic verse and the exclusion of comic scenes from the tragedy than to the magnificent scenic accessories—the battles and sacrifices on the stage, the aerial demons singing in the air, and the god of dreams ascending through a trap. The novelty of these Indian spectacles, as well as of the Indian characters, with the splendid Queen Zemponlla, acted by Mrs Marshall in a real Indian dress of feathers presented to her by Mrs Aphra Behn, as the centre of the play, was the chief secret of the success of *The Indian Queen*. These melodramatic properties were so marked a novelty that they could not fail to draw the town. The heroic verse formed but a small ingredient in the play; still, being also a novelty which had just been introduced by Davenant in *The Siege of Rhodes*, it interested the scholarly part of the audience, and so helped to consolidate the success of the stage carpenter. Dryden was tempted to return to tragedy—he followed up *The Indian Queen* with *The Indian Emperor*, which was acted in 1665, and also proved a success.

But Dryden was not content with writing tragedies in rhymed verse. Taking it up with enthusiasm as the only thing which the Elizabethan dramatists had left for their successors to excel in, he propounded the propriety of rhyme in serious plays as a thesis for discussion, and made it the prominent question of the day among men of letters. He took up the question immediately after the success of *The Indian Queen*, in the preface to an edition of *The Rival Ladies*. In that first statement of his case, he considered the chief objection to the use of rhyme, and urged his chief argument in its favour. Rhyme was not natural, some people had said; to which he answers that it is as natural as blank verse, and that much of its unnaturalness is not the fault of the rhyme but of the writer, who has not sufficient command of language to rhyme easily. In favour of rhyme he has to say that it at once stimulates the imagination, and prevents it from being too discursive in its flights. During the Great Plague, when the theatres were closed, and Dryden was living in the country at the house of his father-in-law, the earl of Berkshire, he occupied a considerable part of his time in thinking over the principles of dramatic composition, and threw his meditations and conclusions into the form of a dialogue, which he called an *Essay of Dramatic Poetry*, and published in 1668. One of the main topics of the essay was the admissibility of rhyme in serious plays, Dryden making Neander, the interlocutor who represents himself, repeat with fresh illustrations all that he had said in its favour. By this time, however, Sir R. Howard, his brother-in-law, whom he had joined in writing the rhymed *Indian Queen*, had changed his mind about the heroic couplet, and made some offensive comments on Dryden's essay in a hoity-toity preface to *The Duke of Lerma*. Dryden at once replied to his brother-in-law in a master-piece of sarcastic retort and vigorous reasoning, publishing his reply as a preface to *The Indian Emperor*. It is the ablest and most complete statement of his views about the employment of rhymed couplets in tragedy.

Before his return to town at the end of 1666, when the theatres were reopened, Dryden wrote a poem on the Dutch war and the Great Fire, entitled *Annus Mirabilis*. The poem is in quatrains, the metre of his *Heroic Stanzas* in praise of Cromwell, which Dryden chose, he tells us, "because he had ever judged it more noble and of greater dignity both for the sound and number than any other verse in use amongst us." The preface to the poem contains an interesting discussion of what he calls "wit-writing," introduced by the remark that "the composition of all poems is or ought to be of wit." His description of the Fire is a famous specimen of this wit-writing, much more careless and daring, and much more difficult to sympathize with, than the graver conceits in his panegyric of the Protector. In *Annus Mirabilis* the poet apostrophizes the newly founded Royal Society, of which he had been elected a member in 1662, more probably through personal connection than on the ground of scientific attainments.

From the reopening of the theatres in 1666, till November 1681, the date of his *Absalom and Achitophel*, Dryden produced nothing but plays. The stage was his chief source of income. *Secret Love, or the Maiden Queen*, a tragic-comedy, produced in March 1667, does not come up to our expectations as the first-fruit of the author's rest from composition and prolonged study of dramatic art. The prologue claims that it is written with pains and thought, by the exactest rules, with strict observance of the unities, and "a mingled chime of Jonson's humour and of Corneille's rhyme," but it owed its success chiefly to the charm of Nell Gwynne's acting in the part of Florimel. It is noticeable that only the more passionate parts of the dialogue are rhymed, Dryden's theory apparently being that rhyme is then demanded for the elevation of the style. His next play, *Sir Martin Marcell*, an adaptation from Molière's *L'Étourdi*, was produced at the Duke's Theatre, in the name of the duke of Newcastle. It was about this time that Dryden became a retained writer under contract for the King's Theatre, receiving from it £300 or £400 a year, till it was burnt down in 1672, and about £200 for six years more till the beginning of 1678. If *Sir Martin Marcell* was written but not produced before this contract was entered into, one can understand why it was announced as the duke of Newcastle's. His co-operation with Davenant in a new version of Shakespeare's *Tempest*—for his share in which Dryden can hardly be pardoned on the ground that the chief alterations were happy thoughts of Davenant's, seeing that he affirms he never worked at anything with more delight—must also be supposed to be anterior to the completion of his contract with the Theatre Royal. The existence of the contract came to light from Dryden's non-fulfilment of its terms. He was engaged to write three plays a year, and he contributed only ten plays during the ten years of his engagement, finally exhausting the patience of his partners by joining in the composition of a play for the rival house. In adapting *L'Étourdi*, Dryden did not catch Molière's lightness of touch; his alterations go towards making the comedy into a farce. Perhaps all the more on this account *Sir Martin Marcell* had a great run at the theatre in Lincoln's Inn Fields. As we have said, there is always a certain coarseness in Dryden's humour, apart from the coarseness of his age,—a certain forcible roughness of touch which belongs to the character of the man. His *An Evening's Love, or the Mock Astrologer*, an adaptation from the younger Corneille, produced at the King's Theatre in 1668, seemed to Pepys "very smutty, and nothing so good as *The Maiden Queen* or *The Indian Emperor* of Dryden's making." Evelyn thought it foolish and profane, and was grieved "to see how the stage was degenerated and polluted by the licentious times." *Ladies à la Mode*, another of Dryden's contract comedies, produced in 1668,

was "so mean a thing," Pepys says, that it was only once acted, and Dryden never published it. Of his other comedies, *Marriage à la Mode* (produced 1672), *Love in a Nunnery* (1672), *Limberham, or the Kind Keeper*, only the first was moderately successful. The failure was not due to want of ribaldry.

While Dryden met with such indifferent success in his willing efforts to supply the demand of the age for low comedy, he struck upon a really popular and profitable vein in heroic tragedy. *Tyrannic Love, or the Royal Martyr*, a Roman play, in which St Catherine is introduced, and with her some striking supernatural machinery, was produced in 1669. It is in rhymed couplets, but the author again did not trust solely for success to them; for, besides the magic incantations, the singing angels, and the view of Paradise, he made Nell Gwynne, who had stabbed herself as Valeria, start to life again as she was being carried off the stage, and speak a riotously funny epilogue, in violent contrast to the serious character of the play. *Almanzor and Almahide, or the Conquest of Granada*, a tragedy in two parts, appeared in 1670. It seems to have given the crowning touch of provocation to the wits, who had never ceased to ridicule the popular taste for these extravagant heroic plays. Dryden almost invited burlesque in his epilogue to *The Conquest of Granada*, in which he charged the comedy of the Elizabethan age with coarseness and mechanical humour, and its conceptions of love and honour with meanness, and claimed for his own time and his own plays an advance in these respects. *The Rehearsal*, written by the duke of Buckingham, with the assistance, it was said, of Clifford, Sprat, and others, and produced in 1671, was a severe and just punishment for this boast. Dryden is here unmercifully ridiculed under the name of Bayes, he having obtained the laureateship from the king (with a pension of £300 a year and a butt of canary wine) in 1670. It is said that *The Rehearsal* was begun in 1663 and ready for representation before the Plague. But this probably only means that Buckingham and his friends were so tickled with the absurdities of Davenant's operatic heroes in *The Siege of Rhodes*, and the extravagant heroics of *The Indian Queen*, that they resolved to burlesque them. Materials accumulated upon them as the fashion continued, and by the time Dryden had produced his *Tyrannic Love*, and his *Conquest of Granada*, he had so established himself as the chief offender as to naturally become the centre of the burlesque. It is commonly said that Dryden passed over the attack on himself without reply, either because he admitted its justice or because he feared to offend the king's favourite. But this is not strictly so; his reply is contained in the dedication and preface to his *Conquest of Granada*; and his prose defence of the epilogue was published in 1672, in which, so far from laughing with his censors, he addresses them from the eminence of success, saying that "with the common good fortune of prosperous gamblers he can be content to sit quietly." Heroic verse, he assures them, is so established that few tragedies are likely henceforward to be written in any other metre, and he retorts upon their exposure of improbabilities in his plays, by criticizing the ridiculous incoherent stories and mean writing of Shakespeare and Jonson. Dignified reassertion of his positions was Dryden's way of meeting the ridicule of *The Rehearsal*. In the course of a year or two, *The Conquest of Granada* being attacked also by Settle, a rival playwright who had obtained considerable success, he had an opportunity of taking revenge in a style more suited to his sharp temper and power of severe writing.

Dryden's reply to *The Rehearsal* was lofty and firm. But though he put a bold face on a practice which it is but fair to suppose that he adopted only to supply a popular

demand, he did not write many more heroic plays in rhyme. Perhaps the ridicule of *The Rehearsal* had destroyed their popularity. His next tragedy, *Amboyna*, an exhibition of certain atrocities committed by the Dutch on English merchants in the East Indies, put on the stage to inflame the public mind in view of the Dutch war, was written, with the exception of a few passages, in prose, and those passages in blank verse. An opera which he wrote in rhymed couplets, called *The State of Innocence, or the Fall of Man*, an attempt to turn part of *Paradise Lost* into rhyme, as a proof of its superiority to blank verse, was prefaced by an apology for heroic poetry and poetic licence, and published in 1674, but it was never acted. The redeeming circumstance about the performance is the admiration professed by the adapter for his original, which he pronounces "undoubtedly one of the greatest, most noble, and most sublime poems which either this age or nation has produced." Dryden is said to have had the elder poet's leave "to tag his verses." *Aurengzebe* was Dryden's last rhymed tragedy. In the prologue he confessed that he had grown weary of his long-loved mistress rhyme. But the stings of *The Rehearsal* had stimulated him to do his utmost to justify his devotion to his mistress. He claims that *Aurengzebe* is "the most correct" of his plays, and it is certainly superior, both in versification and in moderation of language, to its predecessors. It was acted in 1675, and published in the following year.

If Dryden had died in 1676, at the age of forty-five, he would have left a very inconsiderable name behind him. The fray between him and Settle might have been looked upon as a passage at arms between equals. After the production of *Aurengzebe* he seems to have rested for an interval from writing, enabled to do so, probably, by an additional pension of £100 granted to him by the king. During this interval he would seem to have reconsidered the principles of dramatic composition, and to have made a particular study of the works of Shakespeare. The fruits of this appeared in *All for Love, or the World Well Lost*, a version of the story of Antony and Cleopatra, produced in 1678, which must be regarded as a new departure in his dramatic career, a very remarkable departure for a man of his age, and a wonderful proof of undiminished openness and plasticity of mind. In his previous writings on dramatic theory, Dryden, while admiring the rhyme of the French dramatists as an advance in art, did not give the same praise to the regularity of their plots; he was disposed to give the preference to the irregular structure of the Elizabethan dramatists, as being more favourable to variety both of action and of character. But now he abandoned rhyme, and, if we might judge from *All for Love*, and the precepts laid down in his *Grounds of Criticism in Tragedy*, the chief point in which he aimed at excelling the Elizabethans was in giving greater unity to his plot. He upheld still the superiority of Shakespeare to the French dramatists in the delineation of character, but he thought that the scope of the action might be restricted, and the parts bound more closely together with advantage. *All for Love* and *Antony and Cleopatra* are two excellent plays for the comparison of the two methods. Dryden gave all his strength to *All for Love*, writing the play for himself, as he said, and not for the public. Carrying out the idea expressed in the title, he represents the two lovers as being more entirely under the dominion of love than Shakespeare's Antony and Cleopatra. Shakespeare's Antony is moved by other impulses than the passion for Cleopatra; it is his master motive, but it has to maintain a struggle for supremacy; "Roman thoughts" strike in upon him even in the very height of the enjoyment of his mistress's love, he chafes under the yoke, and breaks away from her of his own impulse at the call of spontaneously reawakened ambition. Dryden's

Antony is so deeply sunk in love that no other impulse has power to stir him; it takes much persuasion and skilful artifice to detach him from Cleopatra even in thought, and his soul returns to her violently before the rupture has been completed. On the other hand, Dryden's Cleopatra is so completely enslaved by love for Antony that she is incapable of using the calculated caprices and meretricious coqueries which Shakespeare's Cleopatra deliberately practises as the highest art of love, the surest way of maintaining her empire over her great captain's heart. It is with difficulty that Dryden's Cleopatra will agree, on the earnest solicitation of a wily counsellor, to feign a liking for Dolabella to excite Antony's jealousy, and she cannot keep up the pretence through a few sentences. The characters of the two lovers are thus very much contracted, indeed almost overwhelmed, beneath the pressure of the one ruling motive. And as Dryden thus introduces a greater regularity of character into the drama, so he also very much contracts the action, in order to give probability to this temporary subjugation of individual character. The action of Dryden's play takes place wholly in Alexandria, within the compass of a few days; it does not, like Shakespeare's, extend over several years, and present incessant changes of scene. Dryden chooses, as it were, a fragment of an historical action, a single moment during which motives play within a narrow circle, the culminating point in the relations between his two personages. He devotes his whole play, also, to those relations; only what bears upon them is admitted. In Shakespeare's play we get a certain historical perspective, in which the love of Antony and Cleopatra appears in its true proportions beneath the firmament that overhangs human affairs. In Dryden's play this love is our universe; all the other concerns of the world retire into a shadowy, indistinct background. If we rise from a comparison of the plays with an impression that the Elizabethan drama is a higher type of drama, taking Dryden's own definition of the word as "a just and lively image of human nature," we rise also with an impression of Dryden's power such as we get from nothing else that he had written since his *Heroic Stanzas*, twenty years before. ✓

It was twelve years before Dryden produced another tragedy worthy of the power shown in *All for Love*. *Don Sebastian* was acted and published in 1690. In the interval, to sum up briefly Dryden's work as a dramatist, he wrote *Edipus* (1678) and *The Duke of Guise* (1683) in conjunction with Lee; *Troilus and Cressida*, 1679; *The Spanish Friar*, 1681; *Albion and Albanus*, an opera, 1685; *Amphitryon*, 1690. In *Troilus and Cressida* he follows Shakespeare closely in the plot, but the dialogue is rewritten throughout, and not for the better. The versification and the language of the first and the third acts of *Edipus*, which with the general plan of the play were Dryden's contribution to the joint work, bear marked evidence of his recent study of Shakespeare. The plot of *Don Sebastian* is more intricate than that of *All for Love*. It has also more of the characteristics of his heroic dramas; the extravagance of sentiment and the suddenness of impulse remind us occasionally of *The Indian Emperor*; but the characters are much more elaborately studied than in Dryden's earlier plays, and the verse is sinewy and powerful. It would be difficult to say whether *Don Sebastian* or *All for Love* is his best play; they share the palm between them. Dryden's subsequent plays are not remarkable. Their titles and dates are—*King Arthur*, an opera, 1691; *Cleomenes*, 1692; *Love Triumphant*, 1694.

Soon after Dryden's abandonment of heroic couplets in tragedy, he found new and more congenial work for his favourite instrument in satire. As usual the idea was not original to Dryden, though he struck in with his majestic step and energy divine, and immediately took the lead.

His pioneer was Mulgrave's *Essay on Satire*, an attack on Rochester and the court, circulated in 1679. Dryden himself was suspected of the authorship, and cudgelled by hired ruffians as the author; but it is not likely that he attacked the king on whom he was dependent for the greater part of his income. In the same year Oldham's satire on the Jesuits had immense popularity, chiefly owing to the excitement about the Popish plot. Dryden took the field as a satirist towards the close of 1681, on the side of the court, at the moment when Shaftesbury, baffled in his efforts to exclude the duke of York from the throne as a papist, and secure the succession of the duke of Monmouth, was waiting his trial for high treason. *Absalom and Achitophel* produced a great stir. Nine editions were sold in rapid succession in the course of a year. It was a new thing for the public to have the leading men of the day held up to laughter, contempt, and indignation under disguises which a little trouble enabled them to penetrate. There was no compunction in Dryden's ridicule and invective. Delicate wit was not one of Dryden's gifts; the motions of his weapon were sweeping, and the blows hard and trenchant. The advantage he had gained by his recent studies of character was fully used in his portraits of Shaftesbury and Buckingham, Achitophel and Zimri. In these portraits he shows considerable art in the introduction of redeeming traits to the general outline of malignity and depravity. Against Buckingham Dryden had old scores to pay off, but he was too practised in the language of eulogy and invective to need any personal stimulus. "Glorious John" had a mind superior to petty hatreds, as well as, it must be admitted, to petty friendships, and it is not impossible that the fact that his pension had not been paid since the beginning of 1680 weighed with him in writing this satire to gain the favour of the court. In a play produced in 1681, *The Spanish Friar*, he had written on the other side, gratifying the popular feeling by attacking the Papists. Three other satires, with which he followed up *Absalom and Achitophel*, dealt with smaller game than this master-piece, though one of them was hardly inferior in point of literary power. *The Medal* was written in ridicule of the medal struck to commemorate Shaftesbury's acquittal. Then Dryden had to take vengeance on the literary champions of the Whig party, who had opened upon him with all their artillery. Their leader, Shadwell, he essayed to demolish under the nickname of "MacFlecknoe." Besides a separate poem under that title, he contributed a long passage to a second part of *Absalom and Achitophel*, written chiefly by Nahum Tate, in which Ferguson, Forbes, Settle, and Shadwell were victims of his strident lash. *Religio Laici*, which came immediately after, in November 1682, though nominally an exposition of a layman's creed, and deservedly admired as such, was not without a political purpose. It attacked the Papists, but declared the "fanatics" to be still more dangerous, which fitted in with Charles's policy of conciliating the church by persecuting the Nonconformists.

Dryden's next poem in heroic couplets was in a different strain. On the accession of James, in 1685, he became a Roman Catholic. There has been much discussion as to whether this conversion was or was not sincere. It can only be said that the coincidence between his change of faith and his change of patron was suspicious, and that Dryden's character for consistency is certainly not of a kind to quench suspicion. The force of the coincidence cannot be removed by such pleas as that his wife had been a Roman Catholic for several years, or that he was converted by his son, who was converted at Cambridge, even if there were any evidence for these statements. Scott defended Dryden's conversion, as Macaulay denounced it, from party motives; on any other grounds, it is not worth discussing. Nothing can be

clearer than that Dryden all his life through regard literary powers as a means of subsistence, and had only once scruple about accepting a brief on any side. *The Love in a and Panther*, published in 1687, is an ingenious and only the hind, immortal and unchanged." There is no beauty in the picture of this tender creature, and its in the forest are not spared. One can understand admiration that the poem received when such allegories in fashion. It was the chief cause of the veneration which Dryden was regarded by Pope, who, himself educated in the Roman Catholic faith, was taken as a boy of two to see the veteran poet in his chair of honour and authority at Will's coffee-house. It was also very open to ridicule and was treated in this spirit by Prior and Montagu, the future earl of Halifax. Dryden's other literary services to James were a savage reply to Stillingfleet—who had attacked two papers published by the king immediately after his accession, one said to have been written by his late brother in advocacy of the Church of Rome, the other by his late wife explaining the reasons for her conversion—and a translation of a life of Xavier in prose. He had written also a panegyric of Charles, and a eulogy of James under the title of *Britannia Rediviva*, which it is interesting to compare with his other productions of the same kind.

Dryden did not abjure his new faith on the Revolution, and so lost his office and pension as laureate and historiographer royal. For this act of constancy he deserves credit, if the new powers would have considered his services worth having after his frequent apostasies. His rival Shadwell reigned in his stead. Dryden was once more thrown mainly upon his pen for support. He turned again to the stage and wrote the plays which we have enumerated. A great feature in the last decade of his life was his translations from the classics. A volume of miscellanies published in 1685 had contained some translations from Virgil, Horace, Lucretius, and Theocritus. He now produced translations more deliberately as a saleable commodity. A volume of miscellanies, which appeared in 1693, contained translations from Homer and Ovid. In the same year he published a translation of the satires of Juvenal and Persius, written with the assistance of his two elder sons. Johnson passes on this work the just criticism that "though, like all other productions of Dryden, it may have shining parts, it seems to have been written merely for wages, in an uniform mediocrity." When Dryden took his farewell of the stage in 1694, he announced his intention of devoting himself to a translation of the whole of Virgil. On this he seems really to have laboured, and great expectations were formed of it. It was published in 1697, and proved a great success. To judge it by its fidelity as a reproduction of the original would be to apply too high a standard, but it is an interesting rendering of Virgil into the style of Dryden, and as a poem was read with delight in its own age. Soon after its publication, Dryden wrote one of his master-pieces, the second Ode on St Cecilia's day. His next work was to render some of Chaucer's and Boccaccio's tales and Ovid's metamorphoses into his own verse. These translations appeared a few months before his death, and are known by the title of *Fables*. Thus a large portion of the closing years of Dryden's life were spent in translating for bread. He had a windfall of 500 guineas from Lord Abingdon for a poem on the death of his wife in 1691, but generally he was in considerable pecuniary straits. He is supposed to have received occasional presents from rich and powerful friends, but he never received anything from the court, and he was too proud to make advances. Besides, his three sons held various posts in the service of the Pope at Rome, and he could

not well be on good terms with both courts. However, he was not molested in London by the Government, and in private he was treated with the respect due to his old age and his admitted position as the greatest of living English poets. His death took place on the 1st of May 1700.

Dryden's conversion to Catholicism had a great indirect influence on the preservation of his fame. It was this which gained him the discipleship and loving imitation of Pope. He thus became by accident, as it were, the literary father and chief model of the greatest poet of the next generation. If his fame had stood simply upon his merits as a poet, he would in all likelihood have been a much less imposing figure in literary history than he is now. The splendid force of his satire must always be admired, but there is surprisingly little of the vast mass of his writings that can be considered worthy of lasting remembrance. He showed little inventive genius. He was simply a masterly *littérateur* of immense intellectual energy, whose one lucky hit was the first splendid application of heroic couplets to satire and religious, moral, and political argument. Upon this lucky hit supervened another, the accidental discipleship of Pope. Dryden lent his gift of verse to the service of politics, and his fame profited by the connection. It would be unjust to say that his fame was due to this, but it was helped by this; apart from the attachment of Pope, he owed to party also something of the favour of Johnson and the personal championship and editorial zeal of Scott.

The standard edition of Dryden is Scott's. There is an admirable edition of his poetical works in the Globe series, by Mr W. D. Christie, enriched with an elaborately accurate memoir and painstaking notes. His two best plays, *All for Love* and *Don Sebastian*, have recently been republished by Mr. J. L. Seton. (W. M.)

DRY ROT, a disease in timber, apparently infectious, which occasions the destruction of its fibres, and reduces it eventually to a mass of dry dust. It is produced most readily in a warm, moist, stagnant atmosphere, while common or wet rot is the result of the exposure of wood to repeated changes of climatic conditions. In both diseases, however, a kind of spontaneous combustion or decomposition goes on in the wood; water, carbonic acid gas, and probably carburetted hydrogen are evolved, and a pulverulent substance, or humus, remains. Though the growth of fungi undoubtedly accelerates the progress of dry rot, it would seem that the true origin of the disease is the incipient decomposition of the sap in wood, and that by virtue of this decomposition the fungi obtain a nidus for their growth. The most formidable of the dry rot fungi is the species *Merulius lacrymans*, which is particularly destructive of coniferous wood; other species are *Polyporus hybridus*, which thrives in oak-built ships, and *P. destructor* and *Thelephora puteana*, found in a variety of wooden structures. The nature of ships' cargoes has a considerable influence on the duration of their timbers,—hemp, pepper, and cotton being highly favourable, and lime and coal unfavourable, to the development of dry rot. The commonest precaution against the occurrence of that disease is to deprive the wood of its moisture by exposure to the open air, or, in other words, to season it. Charring, steaming, boiling, and smoke-curing are other modes of desiccation which have been resorted to. At one time a Mr Lukin attempted the rapid seasoning of logs of green oak at Woolwich dockyard by heating them in pulverized charcoal; but the process, though it lessened the weight and dimensions of the wood, started its fibres from one another. He then sought to replace the moisture of heated wood by the products of the distillation of pitch-pine saw-dust; before, however, the operation was judged to be complete, an explosion took place, which proved fatal to eight workmen,

and wounded twelve; the experiment, therefore, was not repeated. Davison and Symington's patent process of artificial drying, which has been found to yield good results, consists in exposing the wood to a current of air moving at the rate of about 48 miles an hour, and having a temperature of 110° to 112° Fahr.

The felling of trees when void of fresh sap, as a means of obviating the rotting of timber, is a practice of very ancient origin. Vitruvius directs (ii. cap. 9) that, to secure good timber, trees should be cut to the pith, so as to allow of the escape of their sap, which by dying in the wood would injure its quality; also that felling should take place only from early autumn until the end of winter. The supposed superior quality of wood cut in winter, and the early practice in England of felling oak timber at that season, may be inferred from a statute of James I., which enacted "that no person or persons shall fell, or cause to be felled, any oaken trees meet to be barked, when bark is worth 2s. a cart-load (timber for the needful building and reparation of houses, ships, or mills only excepted), but between the first day of April and last day of June, not even for the king's use, out of barking time, except for building or repairing his Majesty's houses or ships." In giving testimony before a committee of the House of Commons in March 1771, Mr Barnard of Deptford expressed it as his opinion that to secure durable timber for ship-building, trees should be barked in spring and not felled till the succeeding winter. In France, so long ago as 1669, a royal decree limited the felling of timber from the 1st October to the 15th April; and, in an order issued to the commissioners of forests, Napoleon I. directed that the felling of naval timber should take place only from November 1 to March 15, and during the decrease of the moon, on account of the rapid decay of timber, through the fermentation of its sap, if cut at other seasons. The burying of wood in water, which dissolves out or alters its putrescible constituents, has long been practised as a means of seasoning. The old "Resistance" frigate, which went down in Malta harbour, remained under water for some months, and on being raised was found to be entirely freed from the dry rot fungus that had previously covered her; similarly, in the ship "Eden," the progress of rot was completely arrested by 18 months' submergence in Plymouth Sound, so that after remaining a year at home in excellent condition she was sent out to the East Indies. It was an ancient practice in England to place timber for thrashing-floors and oak planks for wainscoting in running water to season them. Whale and other oils have been recommended for the preservation of wood; and in 1737 a patent for the employment of hot oil was taken out by a Mr Emerson. Common salt, but for the attraction of its impurities for moisture, might be advantageously used; indeed the Dutch ship-builders, having observed that the busses in which herrings were stowed away in pickle lasted longer than any other craft, adopted the practice of filling up with salt, not only the vacant spaces between the planks, but also holes bored for its reception in the large timbers.

Among the many processes for the prevention of dry and wet rot in wood by impregnating it with material capable of precipitating its coagulable constituents in a permanently insoluble and impntrescible form, the following may be enumerated.—Kyan's (1832), in which, according to Sir Humphry Davy's suggestion, a solution of corrosive sublimate is employed, Sir W. Burnett's (1836), M. Breant's (1837), Margary's (1837), and Payne's (1841), which consist respectively in the use of zinc chloride, copperas, copper sulphate, and copperas followed by sodium carbonate; and Bethell's (1838), for the treatment of the wood with crude creasote or oil of tar. The application of a solution of copper sulphate, containing about a quarter of a

pound of the salt to each gallon of water, according to Margary's patent, has been found very efficacious in the case of timber not liable to the solvent action of water; but of all processes the most satisfactory is Bethell's. In this the wood is injected with heavy tar-oil in cylinders 6 feet in diameter and 20 to 50 feet in length, at a temperature of 120° Fahr., and under a pressure of 150 lb to the square inch, so that ordinary fir timber absorbs on the average 8 to 10 lb of the liquid per cubic foot. Timber thus prepared has been found not only durable, but also exempt from the attacks of insects and other pests.

J. Papworth, *An Essay on the cause of the Dry Rot in Buildings*, 1806; Bowden, *A Treatise on the Dry Rot*, 1815; Wade, *A Treatise on the Dry Rot in Timber*, 1815; Chapman, *On the Prevention of Timber from Premature Decay*, 1817; McWilliams, *Essay on the Origin and Operation of the Dry Rot*, 1818; Burnell in *Journal of the Society of Arts*, June 1, 1860, vol. viii.

DU BARRY GOMARD DE VAUBERNIER, MARIE JEANNE, COUNTESS (1746–1793), mistress of Louis XV., was the daughter of Vaubernier, a clerk of the customs at Vaucouleurs, and was born there on the 19th August 1746. She received little or no education, and, coming to Paris while yet very young, she entered the house of a "marchande de modes." She soon fell a victim to the temptations which there beset her, and lived as a courtesan under the name of *Mdlle. Lange*. Her great and peculiar personal charms led Jean Count Du Barry to form the design of receiving her into his house, in order to make it more attractive to the dupes from whom by gambling he won money to furnish him with the means of dissipation. Her success surpassing his expectations, his hopes took a higher flight, and he presented her to Lebel, valet de chambre of Louis XV., with the intention that she should become the mistress of the king. In this she succeeded; but as the favour shown by Louis to a courtesan roused murmurs in the court and remonstrances from his ministers and the members of the royal family, Louis, who was too infatuated to remove her, met their wishes half-way by securing for her a nominal husband. Count Jean Du Barry was married himself, but his brother William offered himself for the ceremony, and after its performance the Countess Du Barry was presented at court on the 22d April 1769. Her influence over the monarch was absolute until his death, and courtiers and ministers were in favour or disgrace with him in exact accordance with her wishes. The Duc de Choiseul, who refused to acknowledge her, was disgraced in 1771; and the Duc d'Aiguillon, who had the reputation of being her lover, took his place, and in concert with her governed the monarch. The favour of Louis for the Countess Du Barry continued to estrange him from his children and from the most of the royal family, and this isolation induced him to build for her the magnificent mansion of *Luciennes*. At his death in 1774 an order of his successor banished her to *L'Abbaye-du-Pont-aux-Dames*, near Meaux, but the queen interceding for her, the king in the following year gave her permission to reside at *Luciennes* with a pension. Having gone to England in 1792 to endeavour to raise money on her jewels, she was on her return accused before the Revolutionary tribunal of having dissipated the treasures of the state, conspired against the republic, and worn, in London, "mourning for the tyrant." She was condemned to death December 7, 1793, and beheaded the same evening.

DUBLIN, a maritime county of Ireland, situated in the province of Leinster, and containing the Irish metropolis. It is bounded on the N. by the county Meath, E. by the Irish Sea, S. by Wicklow, and W. by Kildare and Meath. With the exception of Louth and Carlow, Dublin is the smallest county in Ireland. Its greatest length is 32 miles, its greatest breadth 18; and the area is 354 square miles, or 226,895 acres.

Geology.—The greater part of the county rests on the eastern extremity of the great bed of flötz limestone that extends over the middle of the island, widening as it spreads westward. It rises in its southern part into a range of mountains, which forms the verge of an elevated district, extending thence for more than thirty miles to the south through the county of Wicklow. Through this tract a large body of granite passes in a south-western direction, commencing at Blackrock and passing by Dundrum and Rathfarnham, and forming the loftiest summit in the county, bounded on its eastern and western sides by incumbent rocks of great variety of structure and relations; micaceous schist exists at Killiney and Rathfarnham, and argillaceous schist, on both sides of the granite and quartz rock, in the eastern side alone, forming the promontory of Bray Head, and reappearing in the more northern part of the county, where it forms the picturesque peninsula of Howth, and rises to the height of 567 feet above the level of the sea. The country near Bray presents, within a small space, an instructive series of rocks; and at Killiney schistose beds are to be seen, of considerable extent, reposing on granite. Near Booterstown, a mass of compact limestone is visible within a few fathoms of the granite. Calp, or "black quarry stone," a variety of limestone, is the prevailing rock in the immediate vicinity of Dublin, and is much used for building; and the granite of Dalkey and the neighbourhood is also much used for architectural purposes in the city and environs; quantities of it are exported to England. Petrifications abound in many parts of the limestone country. In the peninsula of Howth gray ore of manganese, brown ironstone, and brown iron-ore occur in abundance.

Surface—The northern portion of the county is flat, and the soil good, particularly on the borders of Meath; but on the southern side the land rises into elevations of considerable height. The mountains are chiefly covered with heath, except where a subsidence in the ground affords a nucleus for the formation of bog, with which about 2000 acres are covered. There are also a few small tracts of bog in the northern part of the county. The mountain district is well adapted for timber, to the growth of which some attention has lately been paid.

Coast.—The northern coast of the county from Balbriggan to Howth has generally a sandy shore, and affords only the small harbours of Balbriggan and Skerries. In the promontory of Howth, the coast suddenly assumes a bolder aspect; and between the town of Howth and the picturesque rocky islet of Ireland's Eye an artificial harbour has been constructed, at an expense of above one-third of a million sterling, which is useful only to vessels of small burthen, and those engaged in the fisheries. Soon after the harbour was finished it was discovered that a shifting sand-bank was likely to render the refuge quite useless; and the slow but certain filling up of the harbour is made apparent at low tide. Kingstown harbour, on the south side of Dublin Bay, is by far the best in the county. It was commenced in 1816, and was not quite finished until 1859,—at a total expenditure of £825,000. A quay runs out into the harbour to a distance of 500 feet, at which vessels drawing 24 feet of water may unload at any state of the tide. The petty harbours of Ballock and Coolmore are on this coast, the former being quite dry save at high tide, and the mouth of the latter being much higher than the bed. Balbriggan is little better, and that at Skerries is hardly to be mentioned. Opposite Coolmore harbour lies Dalkey Island, and the sound between the island and the shore is held to be dangerous in certain conditions of weather. The island is 22 acres in extent, and stands about midway between Kingstown harbour and the beautiful bay of Killiney. North of Howth lies Lambay Island,

about 600 acres in area, the property of Lord Talbot de Malahide. Shell-fish, especially lobsters, are caught here in abundance. Small islets lie not far off, the most interesting of which is that known as Inispatrick, noted as the spot upon which St Patrick first landed in Ireland, and where he built his first church. Ireland's Eye, off Howth, is a very picturesque rock standing on about 54 acres of grass land. It has afforded great room for geological disquisition.

The fishery districts are Dublin and Howth. The chief stations are Howth and Skerries, the former of which is much used by the Manx and Cornish fishermen, who resort in considerable numbers to the harbour during the fishing season. Dublin Bay haddocks and herrings have long been esteemed, and justly, for their superior quality and flavour.

Rivers and Mountains.—The chief river in the county is the Liffey, which rises in the Wicklow Mountains about twelve miles south-west of Dublin, and, after running about 50 miles, empties itself into Dublin Bay. The course of the river is so tortuous that 40 miles may be traversed and only 10 gained in direction. The scenery along the banks of the Liffey is remarkable for its beauty. The mountains which occupy the southern border of the county are the extremities of the great group guarding the adjacent county of Wicklow. The principal summits are the Three Rock Mountain and Garry Castle, the former having an elevation of 1586 feet, and the latter of 1869; and the group formed by Kippure and the Seefin range, Kippure being 2527, and Seefin 2150 feet high. But the grandest features of these hills are the great natural ravines which open in them, the most extraordinary being the Scalp, through which the traveller passes from Dublin to Wicklow.

Agriculture.—Of the 226,895 acres which form the area of the county, 100,236 acres were returned in 1871 as under tillage, 91,503 as pasture, 4716 wood, 15,700 in towns, and 14,470 waste, bog, mountain, and water. The face of the county has indeed changed but little during the century, and the statistics as to the treatment of the soil exhibit an almost stationary result. The growth of the towns suburban to the city has made the only appreciable change, and that change has been not inconsiderable. The farms are in general small. Near Dublin, particularly on the southern side of the city, a very considerable portion of the county consists of ornamental grounds, and the rents are proportionately high.

The produce of the crops is generally greater than in any other county,—not so much on account of any natural superiority in the soil, as by reason of the facilities afforded by the neighbourhood of a large city, and the greater expenditure of capital on the land. Of cereals the principal crops are oats and wheat; and of green crops, potatoes. In live stock the county is particularly rich in proportion to its extent. The following tables give the acreage of crops and numbers of stock in 1873 and 1876:—

	Oats.	Wheat.	Potatoes.	Other Green Crops.	Meadow and Clover	
1873 ...	16,723	6392	10,107	6826	45,574	
1876 ...	16,009	5646	9,863	6566	49,789	
	Horses and Mules.	Cattle.	Sheep.	Pigs.	Goats.	Poultry
1873 ...	21,098	54,502	83,604	20,032	6245	194,880
1876 ...	20,015	52,770	64,263	17,273	5878	213,531

As regards the division of the land, the number of holdings in the county has somewhat diminished within recent years. In 1853, there were 9016 separate holdings, while in 1876 there were only 8792. According to the Owners' Returns of 1876, the county was divided in 1874 among 4100 proprietors, of whom 2526, or 61½ per cent., owned less than one acre of ground, a proportion almost identical with the average of Leinster. From the same

authority it appears that the total area held amounted to 217,457 acres, giving an average of 53 acres per property (that of the province being 187), and the total valuation amounted to £686,794, giving an average of £3, 3s. 2d per acre, as against 18s. 11½d. for the whole province. Fourteen proprietors owned more than 2000 acres each, and 57,969 acres in all, or 26½ per cent. of the area, viz:—Charles Cobbe, 9662 acres; Earl of Howth, 7377; Sir C. C. W. Domville, 6252; George Woods, 4141; Sir Roger Palmer, 3991; Lord Langford, 3659; Ion Trant Hamilton, 3647; Mrs White, 3422; W. W. Hackett, 3198; Eyre Coote's representatives, 3107; R. Q. Alexander, 2973; Earl of Pembroke, 2269; Lord Annaly, 2139; Marquis of Lansdowne, 2132.

The manufactures of the county are mainly confined to the city of Dublin and its neighbourhood. There is, however, a manufactory of cotton hosiery at Balbriggan of some importance.

Administration, &c.—There are nine baronies in the county:—1 and 2 Balrothery East and West, containing Rush and Lusk (population 1800), Skerries (2236), and Balbriggan (2332); 3. Coolock, containing Clontarf (3442), and several minor villages; 4. Nethercross, containing the ancient parliamentary borough of Swords (1008), and the village of Glasnevin; 5. Newcastle, containing the village of Lucan, and Newcastle, which was represented in the Irish Parliament by two members; 6. Uppercross; 7. Rathdown, containing the towns of Dundrum (540), Blackrock (8089), Kingstown (16,378), Dalkey (2584), and Killiney (2290); 8. Castleknock, in which is situated the Phoenix Park; and 9. Dublin, containing the city and many outlying villages. The village of Donnybrook, famous for its fair and accompanying riotous pleasure, is now part of Pembroke township, one of the richest and most beautiful suburbs of the city.

The nine baronies, including the city, are divided into 99 parishes, all within the archdiocese of Dublin. The county proper, excluding the capital, contains 222,709 acres; the rateable property is valued at £700,854; the population at the last census (1871) was 158,936; and the number of houses, 28,803. Between 1841 and 1871 the increase of population was nearly 13·5 per cent., although between May 1851 and December 1871 there emigrated from the county 58,774 persons. In 1871, 70½ per cent. of the total population were Roman Catholics. In the city that denomination forms 79 per cent. The numbers of the last religious census were—Catholics, 111,964; Episcopalians, 39,289; Presbyterians, 2995; and various, 4688. There are two poor-law unions, Balrothery and Rathdown, but portions of the county are in unions situated in adjacent counties. The average daily number of paupers in the county workhouses in 1875 was 674.

Dublin is the head-quarters of the military district, and of the general commanding-in-chief and staff of Ireland.

The total number of children receiving education in 1824–26 was reported in a parliamentary return to be 23,008. In 1853, there were 159 national schools in operation, attended by 28,799 children, and in 1876 there were 52,127 children attending the national schools.

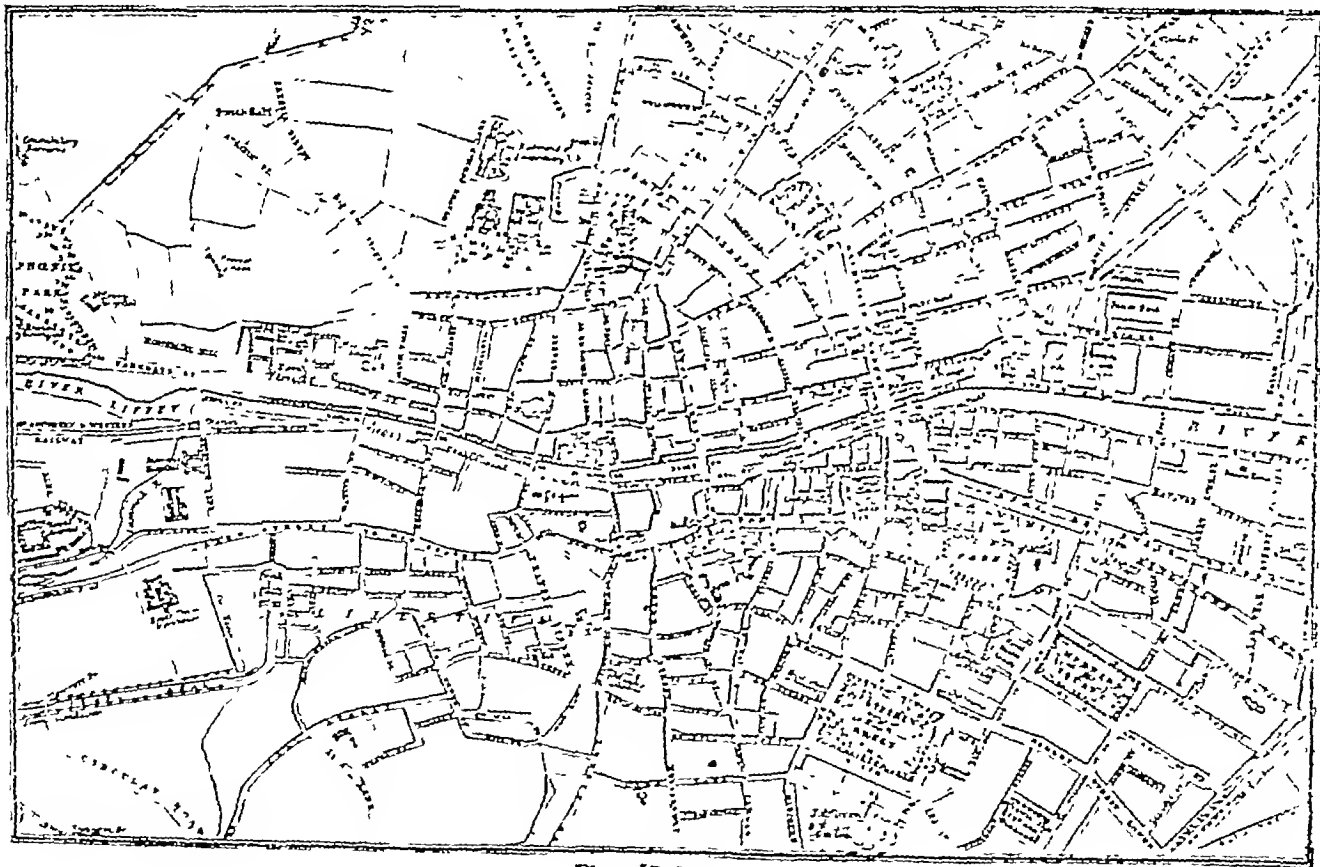

Previous to the union with Great Britain, this county returned ten representatives to the Irish Parliament,—two for the county, two for the city, two for the university, and two for each of the boroughs of Swords and Newcastle. The number of representatives was reduced to five by the Act of Union, one member being withdrawn from the university, and the boroughs of Swords and Newcastle disfranchised. The Reform Act of 1832 restored the second member to the university, leaving the representation in other respects unchanged.

History.—It is stated by Ptolemy that the county Dublin was inhabited by the tribe of the Eblani, who dwelt for the most part in Meath county, but on their settling in Dublin founded the city Eblana, now presumed to be Dublin. Later writers affirm that the Eblani were driven out by the Danes, who held sway until the battle of Clontarf (1014) resulted in the overturn of their power. When the English landed, the people to the north of the Liffey were known among the Irish as *Fingall*, or white foreigners, and those living south of the river were called *Dubhgall*, or black foreigners. The Rev. Cæsar Otway professed to be able to discern signs of the different races even as late as his day; but the modern observer will fail to catch any marks whereby different portions of the community may be distinguished.

In 1210, King John formed this district into a county, comprising the chief portion of country within the English pale. The limits of the county were, however, uncertain, and underwent many changes before they were fixed. Although so near the seat of government, 67,142 acres of profitable land were forfeited in the Rebellion of 1641, and 34,536 acres in the Revolution of 1688. In 1603 the boundaries were definitely marked, the country inhabited by the O'Tooles and the O'Byrnes being formed into the county of Wicklow. The absence of any considerable towns decreases the interest in Dublin county, and it has no historic fields to boast of. In 1867 the most formidable of the Fenian risings took place near the village of Tallaght, about seven miles from the city. The rebels, who numbered from 500 to 700, were found wandering at dawn, some by a small force of constabulary who, having in vain called upon them to yield, fired and wounded five of them; but the great bulk of them were overtaken by the troops under Lord Strathnairn, who captured them with ease and marched them into the city.

Sir John Forbes, a distinguished Scotch physician, who visited Ireland in 1852, speaks thus of the county in his *Memoranda*:—"Without leaving the county of Dublin, the antiquary would have no difficulty in finding numerous objects of interest and instruction, casting light upon the early history of the country. Among the ancient raths, duns, or forts constructed by the native Irish or the Danes, and more probably by both people, for defence or security in positions of natural strength, improved by art and labour, several remain in this county. One at Raheny, although much reduced in its proportions, is still traceable; several yet more imperfect are faintly visible at Coolock; one near Lucan is furnished with the subterranean vaults and passages not unusually found in connection with the larger specimens; and another at Shankhill or Rathmichael, near the remarkable natural pass through the mountain called the Scalp, is of greater extent than the others, more commanding in position, and in close proximity to the ancient church, and supposed fragment of a round tower. Numerous sepulchral mounds of the same period also exist scattered throughout the county, occasionally somewhat similar in appearance to the raths, but generally smaller in extent, altogether artificial, and of conical form. Among its most interesting antiquities this county reckons three of the ancient round towers almost peculiar to Ireland,—one at Swords, another at Lusk, forming one of the angles of the church steeple, and a third in the highest state of preservation at Clonsillaun."

DUBLIN, the metropolis of Ireland, in the county of Dublin and province of Leinster, is a county in itself, and a municipal and parliamentary borough; the area of the former is 3808 acres. It is distant 292 miles W.N.W. from

Plan of Dublin.

London, 138 miles W from Liverpool, and 60 miles W. from Holyhead, in 53° 20' 38" N. lat and 6° 17' 13" W. long, and is situated in the great central limestone district which stretches across the island from the Irish Sea to the Atlantic Ocean, on the River Liffey, extending to the junction of that river with the Bay of Dublin, the waters of which wash its south suburban shores.

In the reign of James II. the population of Dublin was 64,483; in 1728 it had more than doubled; in 1753 it was 161,000; in 1798 Whitelaw estimated it at 182,000; according to the first census (taken in 1821) it was 185,881; it was 232,726 in 1841, 254,808 in 1861, and 246,326 in 1871. This last decrease is due to the recent

increase in wealth and the consequent extra-city residence of the traders and merchants. The suburbs of Dublin have wonderfully improved within the past twenty years, and constitute at present the chief of the many attractions which the stranger is wont to admire. The outlying townships of Rathmines and Rathgar, Kingstown and Pembroke, Clontarf and Dalkey, are all inhabited by persons engaged in the commerce of the city. If we include these populations, the city may be said to contain about 330,000 souls. The parliamentary borough, whose limits are more extensive than those of the municipal borough, covers an area of 5501 acres, and contained in 1871 a population of 267,717 persons. It returns two members to the imperial parliament.

The rainfall is nearly 33 inches; rain or snow falls on 200 days per annum; and the wind blows from the N. or E. for 120 days. The average death-rate is 27 per 1000.

The plan of the city is singularly simple. The Liffey flows almost through the centre from west to east, and the bridges connect long lines of streets running north and south. The communications between the two sides of the city are ample, there being 9 bridges in a distance of about a mile and a half, and ferries for the two miles of shipping between the last bridge and the mouth of the river. Sackville Street is the finest avenue in Dublin; the houses, however, are not uniform, and the street is not long enough for its width, while the Nelson Pillar, itself a beautiful object, blocks the view and interrupts the traffic. The memorial consists of a fluted Doric column 120 feet high, raised on a massive pedestal, the four sides of which show The Nile, Copenhagen, St Vincent, and Trafalgar. On the summit is a colossal statue of Nelson, surrounded by a balustrade, to which there is an ascent by a spiral stair. The O'Connell monument, almost completed by Foley before his decease, is destined for the southern end of Sackville Street; it will cost about £12,000. On the other side of the Liffey, across Carlisle Bridge, is Westmoreland Street,

Environs of Dublin.

with the Bank of Ireland and Trinity College at its southern end. At right angles to Westmoreland Street is Dame Street, unquestionably the best street in the city. The houses are lofty and massive, and more than one of them colossal. At one end is Dublin Castle, and at the other the great front of the Bank and of Trinity college. The chief drawback to Dublin as a city is the sudden transition from magnificence to meanness, and in no part of it is there freedom from this displeasing contrast. Close by its every splendid edifice is a purlieu, with its unpleasant characteristics. In addition to this, the soil is so oozy that, after even a slight shower it is melted into far-spreading mud-lakes, justifying the conjecture that Dublin was in old times the "Town of the Ford of Hurdles on the Black-water." The River Liffey, too, which ought to be a source of beauty, is rendered offensive by receiving the drainage of the city. There are numerous elegant houses in the suburbs, surrounded by well-kept gardens. The slighter rivers, the Tolka, the Dodder, and the Tougue, meander through a well-cultivated country; there is a noble supply of water for domestic purposes; and lines of tramway run from the heart of the city to every outlying district. Formerly Dublin was said to be bounded by the circular road, which is nine miles in extent; but the growth of the

city has far outrun that limit. There are about 820 miles of streets in the borough under the control of the corporation; the valuation of the borough in 1871 (excluding exemptions, Government buildings, religious houses, &c.) amounted to £596,000; the number of houses inhabited was 23,896, uninhabited 1059, and building 87. The want of a Building Act in Dublin has resulted in the absence in many places of anything like uniformity in the frontage, height, or character of its buildings.

The condition of the various orders of the community is perhaps best shown by citing the census returns as to the number of families occupying the four different classes of houses. There were 5035 families in houses of the 1st class, 10,523 families in the 2d class, 16,819 in the 3d class, and 25,733 in the 4th class. The 53,110 families thus hold 23,896 houses. Another way of estimating Dublin society is by taking the occupations of the people. In 1871 there were 331 clergymen in Dublin, 286 barristers, 370 attorneys, 49 architects, 215 accountants, 4000 bootmakers, 1660 tailors, 19,500 domestic servants, 83 photographers, 1000 coachmen and cabmen, 1600 drapers and mercers, 1280 carmen and carriers, 936 cabinetmakers, 3500 clerks, 177 civil engineers, 394 fishmongers, 38 glovemakers, 1867 grocers, 11,530 labourers, 4590 milliners, 1477 printers, 81 sculptors, 223 watch and clock makers, 458 wine and spirit merchants

Judges, lawyers, and doctors may be said to constitute the higher society of Dublin; of the 182 peers of Ireland only two have residences in the capital.

The lord lieutenant lives in Dublin Castle in winter, and in the Viceregal Lodge, Phoenix Park, in summer. He is assisted in the executive by a privy council, nominated by the Crown, and his chief secretary, who must have a seat in the House of Commons. Lords justices govern in the temporary absence of the lord-lieutenant—the lord chancellor, the commander-in-chief, and another privy councillor usually being appointed. Prior to the Act of 1869 disendowing and disestablishing the Irish branch of the Established Church, the archbishop of Dublin was invariably named a lord justice; but in future the archbishop may or may not have a seat at the Council Board.

Dublin is the seat of the Irish courts of law and equity, from which appeal lies only to the House of Lords. The judicial functions are exercised by the lord chancellor, a lord justice of appeal, a vice chancellor, the master of the rolls, and four judges in each of the courts of Queen's bench, common pleas, and exchequer. There are also judges (1) in the court of admiralty, (2) in the bankruptcy court, and (3) in the landed estates court for the sale and transfer of estates in Ireland. The recorder's court determines civil bills and city criminal cases.

Local Government—The municipality is under the government of the lord mayor and corporation. Previous to the Municipal Reform Act of 1840 the corporation consisted of the lord mayor, 2 sheriffs, 24 aldermen, 124 common councilmen, 28 sheriffmen, and 96 representatives of the 25 civic guilds. At present the corporation consists of 15 aldermen and 45 councillors, there being one alderman and 3 councillors for each of the 15 wards into which the city is divided. An alderman or councillor is annually elected lord mayor. The income of the body arises from rents on property, customs, and taxes. The yield in 1875 was £236,804, the expenditure £255,944, and the debt £337,476. Under an Act passed in 1875 the corporation have the right to forward every year three names of persons suitable for the office of high sheriff to the viceroy, one of which shall be selected by him. The lord mayor holds a weekly court for debts above 40s. and under £10, and for the settlement of cases between masters and servants. He is also clerk of the markets, and supervises weights and measures and deals with cases of adulteration. A court of conscience determines debts under 40s and is presided over by the last ex-mayor. A competent fire-brigade is maintained by the corporation. The average number of fires per annum is between 50 and 60; 15 lives have been lost in ten years; and property to the value of £485,800 saved in the same period. The city coroner is a corporate officer. There were 292 inquests in 1875. Under an Act applicable only to Dublin the local rates are collected by a collector-general, and are distributed by him to the different authorities concerned.

Police.—The Dublin metropolitan police is a force peculiar to the city. The remainder of Ireland is protected civilly by the Royal

Trinity College is set down as about £65,000 a year. The average number of students on the books is about 1300. By an Act passed in 1873, known as Fawcett's Act, all tests were abolished, and the prizes and honours of all grades hitherto reserved for Protestants of the Established Church were thrown open to all. Examinations for women are now held under the direction of the College.

The Queen's University, founded in 1850, has quarters in Dublin Castle; but the three colleges are in Cork, Belfast, and Galway. Dublin has no share in the advantages of the university, which are considerable.

The Roman Catholic University derives its entire support from voluntary contributions. There is an annual collection on a certain Sunday in November, and this realizes about £8000. The management is in the hands of the Catholic bishops. The medical school in connection with the university has attained great repute in Ireland.

The Royal College of Science, controlled by the Science and Art Department, is conducted by ten professors. The number of students is seldom greater than 30, amongst whom four royal scholarships and nine royal exhibitions (value £50 for two and three years respectively) are divided. The Parliamentary grant is £6902 per annum. The Royal Dublin Society and the Royal Irish Academy are devoted to science and art. The one receives £7500 a year, and the other £2480. The Royal Hibernian Academy has £300, and the National Gallery £2340 a year. The Zoological Society, having its gardens in the Phoenix Park, has £500 a year.

Schools.—In 1871 there were in the city 336 schools—257 primary and 79 superior. In attendance at the primary were 19,782 Roman Catholics, 4602 Episcopalians, and 842 Presbyterians and others, in attendance at the superior are 1491 Roman Catholics, 2334 Protestants, and 566 Presbyterians and others. This gives a general total of 29,617.

The education of all classes in Dublin is shown in the following figures.—In 1871, 150,581 of seven years and upwards could read and write, 24,224 could read but could not write, and 35,638 were illiterate.

Charities.—Dublin can boast a goodly number of charities. There are 113 charitable institutions, some for the deaf and dumb, the blind, the destitute, the distressed, the unemployed; some for the education of the reduced, and for the sons and daughters of clergymen; and some for orphans, for idiots, for convalescent patients. The Drummond Institution, for the orphan daughters of soldiers, was established in 1864 by a Scotch gentleman named Drummond, who left £20,000 to found the asylum. The Hospital and Free School of King Charles I., commonly called the Blue Coat School, was founded 1670. The school buildings are very handsome, and cost £21,060. The annual income is £4000 a year. The education afforded to 120 boys is of a very superior character. Before the Irish Parliament Houses were erected the parliament met in the school building. Molyneux Asylum for the blind, a splendid building near the city boundary, affords refuge and instruction to 70 females. There are 30 hospitals, of which the chief are—The Westmoreland Lock, parliamentary grant £2600; Stevens, parliamentary grant £1300, donations, &c., £4177; the Meath, parliamentary grant £600, city grant £750, donations £1913; Cork Street Fever, parliamentary grant £2500, donations £1298; House of Industry Hospitals (3), parliamentary grant £7472, donations £693; Rotundo Lying-in, parliamentary grant, £700, city £300, donations £2342; Coombe Lying-in, parliamentary grant £200, city £260, donations £2167; Incurables, parliamentary grant £250, city £150, donations £6000; St Mark's Eye and Ear, parliamentary grant £100, city £100, donations £735. These 11 hospitals in 1875 admitted 9645 patients, and received from Parliament £15,722, from the city authorities £1560, from subscriptions £19,353. Total income of all £36,635. Of the houses supported by voluntary contributions the Adelaide (Protestant), the Mater Misericordie, St Vincent's, and the City of Dublin hospitals are the most important. Lunatics are maintained in St Patrick's Hospital, founded in 1745, pursuant to the will of Dean Swift, and conducted by governors appointed under the charter of incorporation. The Richmond Lunatic Asylum, erected near the House of Industry, and placed under the care of officers appointed by Government, receives patients from a district consisting of the counties of Dublin, Louth, Meath, and Wicklow, each of these contributing towards its expenses in proportion to the number of patients sent in. Besides these public establishments for the recovery and safe custody of innates, there are in the vicinity of Dublin various private asylums.

The principal institution for the blind is Simpson's Hospital, founded by a merchant of Dublin. The income is upwards of £2500 per annum, by which fifty patients are maintained in a large plain edifice situate in Great Britain Street. The apartment can accommodate a hundred inmates. The Richmond National Institution in Sackville Street was founded in order to instruct the blind in some of the more useful handicraft occupations. The principal branches taught are weaving, netting, and basket-making. An institution for the maintenance and education of children born deaf and dumb is maintained at Claremont, near Glasnevin. The plan of the Royal Hospital, for decayed and maimed soldiers, was first suggested by the earl of Essex, when lord lieutenant, and carried into effect through the repeated applications of the duke of Ormond to Charles II. The site chosen for it was that of the ancient priory of Kilmalsham, founded by Strongbow for Knights Templars. The building, completed in 1684, according to a plan of Sir Christopher Wren, is an oblong 308 feet by 238, three sides of which are dwelling-rooms, connected by covered corridors. The fourth contains the chapel, the dining hall, and the apartments of the master, who is always the commander of the forces for the time being. The Roman Catholic Church has charge of a number of special charities, some of them educational and some of them for the relief of suffering.

Libraries, &c.—The principal library in Dublin, for the number and value of its books, is that of Trinity College. It is open of right only to graduates of that university, but admission is obtainable by others by special favour. It contains about 190,000 printed volumes, and 1500 manuscripts. The King's Inns Library is next in value. The right of reading in it is confined to the members of the King's Inns Society,—that is, to barristers, attorneys, and law students. Marsh's Library, attached to St Patrick's Cathedral by the munificent bequest of Primate Marsh, archbishop of Armagh, and incorporated in 1707, contains a good collection of theological works, and is open to the public, but, from the very small portion of its funds appropriated to purchase, it is very deficient in modern publications. It possesses some valuable manuscripts. The want of a library easily accessible, and provided with the works most in request, was attempted to be supplied by a society formed in 1791 (the Dublin Library Society), which collected a large number of books in a handsome and well-arranged building in D'Olier Street. Attached to the library is a fine reading-room, well supplied with newspapers. The Library of the Royal Dublin Society contains upwards of 12,000 volumes. It is particularly rich in works on botany, and in those relating to Ireland. It has likewise a gallery of statuary, in which are casts from the Elgin marbles. The library, museum, and gallery are open to the public,—in happy contravention of the rules, which have been strained in the landable direction of popularizing self-instruction. The Royal Irish Academy's Library is valuable of its kind. It contains many ancient manuscripts, and works dealing with science and antiquities.

Public Buildings.—Dublin has several noble edifices. The first and greatest is the Bank of Ireland, formerly the House of Parliament, which occupies five acres. There are three fronts. The principal, towards College Green, a colonnade of the Ionic order, formed of a façade and two projecting wings, is much admired for the noble simplicity of its elevation. The western front, a portico of four Ionic columns, is connected with the other by a colonnade of the same order, forming the quadrant of a circle. The eastern front, which was the entrance of the House of Lords, was, by their special wish, a colonnade of the Corinthian order, which the architect found great difficulty in uniting with the other parts. The apartment for the lords, a fine room, is hung with tapestry. That of the commons, having been burned in 1792, was reconstructed after a more elegant design, in the form of a circle surrounded by pillars, between which was a gallery for hearers. This fine hall was taken down by the bank directors, and converted into a square room, now the cash-office. The House of Lords remains in its original condition, and is but seldom used.

Trinity College is in itself a source of legitimate pride to the city. The front is plain and massive. The inner courts are large and well proportioned. On the left is the examination hall, containing full length portraits of the queen founder, of Molyneux, of Edmund Burke, Bishop Berkeley, and other celebrities. On the right stand the chapel and the dining hall, side by side, the former having a very handsome interior, and the latter having portraits of

Grattan, Flood, Yelverton, Lord Ross, Lord Kilwarden, and other famous Irishmen. In the centre of the court stands a beautiful campanile. The library contains a gallery 210 feet in length, 41 in breadth, and 40 in height. There are also new buildings in the inner court, in character with the general splendour of the place. The provost's house close by is one of the finest in the city.

Dublin Castle presents a rather motley appearance. The greater portion of it is dingy, being built of brick; but the chapel and tower are very handsome. The castle stands on ten acres, but the apartments are small, with the exception of St Patrick's Hall, which is used on the occasion of investing knights of the order of St Patrick.

The custom-house is considered one of the chief ornaments of the city. It was erected at a cost of about £400,000, and opened in 1791. It stands on the north side of the river below Carlisle Bridge, and presents four fronts, three of which may be seen to advantage. The south front, facing the river, 375 feet in length, is built of Portland stone, finished in the Doric order, with an entablature and bold projecting cornice. The other three fronts are composed of granite, and from the centre rises a dome to the height of 125 feet, surmounted by a figure of Hope.

The Four Courts, in which the superior courts are held, stands on the site of the ancient Dominican monastery of St Saviour, on King's Inn Quay. It is an extensive and imposing structure, erected between the years 1786 and 1800, at a cost of £200,000.

The city hall, formerly the royal exchange, is a handsome building. It is in possession of the corporation, and is used for municipal purposes. The centre hall contains statues of George III., of Grattan by Chantrey (a superb work), of O'Connell by Hogan, of Lucas, and of Drummond.

The post-office stands in Sackville Street. It is built of granite, and is about 120 feet high, 225 in length, and 150 in depth. The centre of the front consists of a boldly projecting portico of six fluted Ionic columns, supporting an entablature and cornice; on the apex is a figure of Hibernia, and Mercury and Fidelity at the sides. The first stone was laid in 1815, and the cost of the pile was £50,000.

Churches—St Patrick's Cathedral, a noble edifice, was restored by the late Sir Benjamin L. Guinness, Bart., at a cost of £130,000; Christ Church Cathedral is now in course of restoration by Mr Henry Roe, and the estimated cost is much over £100,000; Mr Roe has also presented a synod house to the Church of Ireland at a cost of £27,000; the late Mr Findlater gave the Presbyterian body a beautiful church which he erected at a cost of £16,000, the Roman Catholics have raised about 16 magnificent edifices in the last twenty years; most of the Protestant parish churches have been either rebuilt or restored; the Unitarians have two houses, one of them of noble aspect; and the Methodists, the Moravians, the Friends, the Baptists, and the Jews have all provided themselves with suitable places of worship. There are no less than 93 churches of all denominations and a synagogue in Dublin, and at least 70 of these are beautiful modern buildings.

The two cathedral churches of St Patrick and Christ Church are superior to all other edifices in character and interest. The foundation of Christ Church, the older building of the two, is attributed to the Danes in 1038; but it dates its elevation to a deanery and chapter from 1541. The entire length of the nave and choir is 260 feet, that of the transept 110 feet, and the extreme breadth of either 80 feet. Christ Church does not contain many monuments. Among the most interesting is that of Strongbow, the invader of Ireland, whose tomb was long the place at which the tenants of the church lands were accustomed to pay their rents. The monument was injured by the fall of one of the cathedral

walls, but it was afterwards repaired, and is still to be seen in good preservation, with a smaller tomb by its side, supposed to be that of Strongbow's son, who was killed by his father. Synods were occasionally held in this church, and parliaments also, before the Commons' Hall was destroyed in 1566 by the accidental explosion of 114 barrels of gunpowder in a neighbouring street. Here also the impostor Lambert Simnel was crowned.

The cathedral of St Patrick was founded in 1190 by John Comyn, archbishop of Dublin. It was burnt about a hundred years after its first erection, but was again raised from its ruins in increased splendour. At the Reformation it was dissolved, and the building was used for some of the purposes of the courts of justice. Edward VI. contemplated its change into a university, but the project was defeated and a university established elsewhere. In the succeeding reign of Mary, St Patrick's Cathedral was restored to its primary destination. The installations of the knights of St Patrick, the first of which took place in 1783, were originally held here. This cathedral contains the monuments of several illustrious persons, among which the most celebrated are those of Dean Swift; of Mrs Hester Johnson, immortalized under the name of "Stella;" of Archbishop Marsh; of the first earl of Cork; and of Duke Schomberg, who fell at the battle of the Boyne. The tablet over Schomberg's grave contains what Lord Macaulay calls a "furious libel." In the cathedral may be seen the chain ball which killed St Ruth at the battle of Aughrim, and the spurs which he wore when shot. A fine statue of Sir Benjamin Lee Guinness, Bart., the restorer of the cathedral, stands in the aisle.

The Roman Catholic churches are for the most part old and in poor localities. The new churches are, however, of greater proportions and of considerable beauty. The principal is the church of the Augustinians in Thomas Street. This is perhaps the loftiest building in the city. The pro-cathedral in Marlborough Street is a building of great dimensions, highly ornamented internally in the Grecian style, and having a fine Doric portico forming the principal front. The building was commenced in 1816, at an estimated cost of £52,000. St Paul's, on Arran Quay, is an elegant building in the Ionic style. The church of St Francis Xavier was erected at a cost of £18,000, from a Roman Ionic design.

Places of Amusement, &c.—Dublin has a winter palace, on the plan of the London Crystal Palace. The scheme advancing public entertainment failed, and Sir Arthur Guinness, Bart., purchased it from the shareholders for £13,000. It is used now for various purposes. There are three theatres—the Royal (second in size only to Drury Lane and Covent Garden), the Gaiety, and the Queen's Theatre. There are two or three musical societies, which are supported by the middle classes; but very little music of a superior character is afforded to the citizens at large.

The Phoenix Park, just touching the north-west boundary, is seven miles in circumference, and includes an area of 1759 acres. The park is in itself beautiful, and the nearness of the Dublin and Wicklow mountains adds greatly to its attractions. The Viceregal Lodge and the Chief Secretary's Lodge are the only buildings inside the gates. They have little pretension beyond their size.

Monuments.—There are nine of Foley's best statues in Dublin—the Prince Consort, Grattan, Burke, Goldsmith, Guinness, Stokes, Corrigan, and Lord Carlisle; and that to O'Connell may be added. Three of the Georges have memorials; Wellington's monument stands in the Phoenix Park, an obelisk 200 feet high, bearing on the sides the names of his victories, and scenes in relief from the greater battles on the pedestal. There are statues to King William,

to Smith O'Brien, to Lord Eglinton, to William Dargan, to Nolson (already noticed), and to Thomas Moore.

Commerce.—Dublin has little of the bustle which should mark so large a city, and as a matter of fact Belfast is said to transact a greater general trade. There is, too, a spirit of foolish pride which seeks to disown trade; and the tendency to be poor and genteel in the civil service, at the bar, in the constabulary, in the army, in professional life, rather than prosperous in business, is one of the most unfortunate and strongly marked characteristics of Dublin society. That this is attributable to the lingering yet potent influence of an unhappy past is held by some; while others attribute the weakness to the viceregal office and the effects of a sham court. About the time of the Revolution, the woollen trade flourished in Dublin, and the produce attained a great celebrity. The cheapness of labour attracted capitalists, who started extensive factories in that quarter of the town known even now as the Liberties. This quarter was inhabited altogether by workers in wool, and, as the city was small, the aristocracy lived close by in noble mansions which are now miserable memorials of past prosperity. About 1700 the English legislature prevailed on William III. to assent to laws which directly crushed the Irish trade. All exportation except to England was peremptorily forbidden, and the woollen manufacture soon decayed. But even 100 years ago there were 5000 persons at work in the looms of the Liberties, where now there are not a score. About 1715 Parliament favoured the manufacture of linen, and the Linen Hall, now an empty wreck, was built. The cotton trade was soon after introduced; and silk manufacture was begun by the Huguenots, who had settled in Dublin in considerable numbers after the revocation of the Edict of Nantes. Acts favourable to these enterprises were passed, and they flourished apace. But the old jealousy arose in the reign of George I., and in the reign of George III. an Act was passed which tended directly to the ruin of the manufacture. The linen trade shared the same fate. Commerce has increased during the past few generations; but Dublin produces nothing for exportation save whisky and porter. The whisky trade has been greatly extended. Of the 22 distillers and 43 rectifiers in Ireland, the principal are in Dublin; the three houses of Jameson and Roe and Power may be specially mentioned. In 1874, when the duty was at 10s per gallon, £322,950 was received by the customs. The porter trade is also very large. The exports in 1875 were 361,465 hogsheads.

The docks in the river have been improved considerably within the last quarter of a century. The river has been deepened, wharves have been built, new docks have been constructed; and a basin now almost completed, at a cost of £276,000, will add greatly to the accommodation. The two great lines of railway, the Midland and the Great Southern, have extended their ways to the river's edge, so that traffic is much easier and swifter between the provinces and the boats for England than in former times. In 1875, 544 British and foreign vessels entered, and 213 cleared the port of Dublin; while 6850 vessels engaged in the coasting trade entered. The customs dues received in the same year amounted to £1,030,000; these have remained almost stationary for ten years.

The total value of all exported articles from Dublin in 1875 was £44,157; while the exports from Belfast were valued at £253,340. The exports of grain from the city need not be set down, inasmuch as they are intended for other parts of Ireland, and are sent by water. In the following returns for 1868 and 1875, a very remarkable decline in the exports of provisions will be observed, while the exportation of live stock has remained pretty stationary:—

	1868	1875
Butter, firkins	245,419	25,481
Bacon, bales, and boxes	2,893	1,016
Hams, hogsheads, &c.	976	175
Beef, do	2,174	1,540
Pork, barrels	4,265	914
Lard, do	9,542	1,940
Cattle	191,981	192,055
Sheep	166,307	313,000
Calves	1,606	1,665
Pigs	210,263	138,046

The exports in wool and in horses have declined in recent years.

History.—The early history of Dublin is, like the early history of Ireland generally, made up chiefly of legends. It is recorded that the inhabitants of Leinster were defeated by the people of Dublin in the year 291; but what so bare a fact can signify is not easy to discover. Christianity was introduced by St Patrick, about 450. We may pass on to the 9th century, when we find the Danes attacking Dublin and taking it. When Tor-Magnus, the Danish king, was slain by Malachy the king of Ireland, the Danes were swept out of Dublin by the Irish from Meath. Then the Danes regained their power, and the contests were incessant until, in 1014, Brian Boroihme, king of Munster, attacked the enemy and fought the battle of Clontarf, in which he and his son and 11,000 of his followers fell. The Irish, however, won the battle, but the Danes re-occupied the city and held footing in Ireland until 1170. Then came the Anglo-Normans. In 1172 Henry II. landed at Waterford, and came to Dublin and held his court there in a pavilion of wicker-work made "after the country manner," where the Irish chiefs were entertained with great pomp, and alliances entered into with them,—“the plenty of the English table and the goodly courtesy of the attendants” having done much to reconcile them to their new allies. Previous to his departure for England, Henry bestowed the government on Hugh de Lacy, having granted by charter “to his subjects of Bristol his city of Dublin to inhabit, and to hold of him and his heirs for ever, with all the liberties and free customs which his subjects of Bristol then enjoyed at Bristol and through all England.” In 1177 Strongbow, earl of Pembroke, and the chief leader of the Anglo-Norman forces, died in Dublin of a mortification in one of his feet, and was buried in Christ Church Cathedral, where his monument still remains well preserved. A fresh charter was granted in 1207 by King John to the inhabitants of Dublin, who had not yet made their peace with the neighbourhood, but, like the settlers in other towns, were at constant feud with the native Irish, so that two years after the date of this charter, whilst the citizens of Dublin were celebrating Easter at Cullenswood, they were set upon by the Irish of the neighbouring mountains, and 500 of them killed. The scene of slaughter is still called the Bloody Fields, and Easter Monday denominated Black Munday. On each succeeding anniversary of that day, with the desire unfortunately so prevalent of perpetuating a feud, the citizens marched out to Cullenswood with banners displayed—“a terror to the native Irish.” In 1216 Magna Charta, a copy of which is to be found in the Red Book of the Exchequer, was granted to the Irish by Henry III. In 1217 the fee farm of the city was granted to the citizens at a rent of 200 marks per annum; and about this period many monastic buildings were founded. In 1227 the same monarch confirmed the charter of John fixing the city boundaries and the jurisdiction of its magistrates.

During the invasion of Ireland by Edward Bruce, who landed at Carrickfergus with 6000 men, in the commencement of the reign of Edward II., some of the suburbs were burnt to prevent them from falling into his hand. The inroad of Bruce had been countenanced by the native Irish ecclesiastics, whose sentiments were recorded in a statement addressed to Pope John XXII. Some notion of the defence made against Bruce's invasion may be gained from the fact that the churches were torn down to supply stones for the building of the city walls. Bruce had seized Greencastle on his march, but the natives re-took the town, and brought to Dublin the governor who had yielded to Bruce. He was starved to death.

Richard II. erected Dublin into a marquessate in favour of Robert de Vere, whom he also created duke of Ireland. The same monarch entered Dublin in 1394 with 30,000 bowmen and 4000 cavalry, bringing with him the crown jewels, but after holding a parliament and making much courtly display before the native chieftains, on several of whom he conferred knighthood, he returned to England. Five years later, enriched with the spoils of his uncle, John of Gaunt, Richard returned to Ireland, landing at Waterford, whence he marched through the counties of Kilkenny and Wicklow, and subsequently arrived in Dublin, where he remained a fortnight, sumptuously entertained by the provost, as the chief magistrate of the city was then called, till intelligence of the invasion of his kingdom by Bolingbroke recalled him to England.

In 1534 Lord Thomas Fitzgerald, better known as Silken Thomas (so called because of a fantastic fringe worn in the helmet of his followers), a young man of rash courage and good abilities, son of the Lord Deputy Kildare, believing his father, who was imprisoned in the Tower of London, to have been beheaded, organized a rebellion against the English Government, and marched with his followers from the mansion of the earls of Kildare in Thomas Court, through Dame's Gate to St Mary's Abbey, where, in the council chamber, he proclaimed himself a rebel. On his appearing before the wall with a powerful force, the citizens were induced through fear to give admission to a detachment of his troops to besiege the castle; but, on hearing that he had met with a reverse in another quarter, they suddenly closed their gates and detained his men as prisoners. He then attacked the city itself; but, finding it too strong to be seized by a *coup de main*, he raised the siege on condition of having his captured soldiers exchanged for the children of some of the principal citizens who had fallen into his hands. After much vicissitude of fortune, Lord Thomas and others concerned in this rebellion were executed at Tyburn in 1536.

At the breaking out of the civil war in 1641, a conspiracy of the Irish septs, under the direction of Roger Moore, to seize Dublin Castle, was disclosed by one Owen Connolly on the eve of the day on which the attempt was to have been made, and the city was thus preserved for the king's party; but the Irish without commenced an indiscriminate extermination of the Protestant population. In 1646 Dublin was besieged, but without success, by the Irish army of 16,000 foot and 1600 horse, under the guidance of the Pope's nuncio Rinuccini and others, banded together "to restore and establish in Ireland the exercise of the Roman Catholic religion." The city had been put in an efficient state of defence by the marquis of Ormond, then lord-lieutenant; but in the following year, to prevent it falling into the hands of the Irish, he surrendered it on conditions to Colonel Jones, commander of the Parliamentary forces. In 1649 Ormond was totally defeated at the battle of Baginbally, near Old Rathmines, in an attempt to recover possession. The same year Cromwell landed in Dublin, as commander-in-chief under the Parliament, with 9000 foot and 4000 horse, and proceeded thence on his career of conquest.

When James II. landed in Ireland in 1689, to assert his right to the British throne, he held a parliament in Dublin, which passed acts of attainer against upwards of 3000 Protestants. The governor of the city, Colonel Luttrell, at the same time issued a proclamation ordering all Protestants not housekeepers, excepting those following some trade, to depart from the city within 24 hours, under pain of death or imprisonment, and restricting those who were allowed to remain in various ways. In the hope of relieving his financial difficulties, the king erected a mint, where money was coined of the "worst kind of old brass, gun, and the refuse of metals, melted down together," of the nominal value of £1,586,800, with which his troops were paid, and tradesmen were compelled to receive it under penalty of being hanged in case of refusal. Under these regulations the entire coinage was put into circulation. After his defeat at the battle of the Boyne, James returned to Dublin, but left it again before daybreak the next day; and William III. advancing by slow marches, on his arrival encamped at Finglas, with upwards of 30,000 men, and the following day proceeded in state to St Patrick's Cathedral to return thanks for his victory.

In 1783 a convention of delegates from all the volunteer corps in Ireland assembled in Dublin for the purpose of procuring a reform in parliament; but the House of Commons refused to entertain the proposition, and the convention separated without coming to any practical result. In May 1798 the breaking out of a conspiracy planned by the United Irishmen to seize the city was prevented by the capture of Lord Edward Fitzgerald, son of the duke of Leinster and husband of the celebrated "Pamela." Lord Edward died in prison of the wounds received in the encounter which preceded his capture.

In 1800 the Act of Union between Great Britain and Ireland was passed in both parliaments, and on the 1st January following the imperial standard of the United Kingdom was hoisted on Dublin Castle.

In 1803 an insurrection, headed by Robert Emmett, a young barrister of much promise, broke out, but was immediately quelled, with the loss of some lives in the tumult, and the death of its leaders on the scaffold. In 1848 William Smith O'Brien, M.P. for Limerick, raised a rebellion in Tipperary, and the lower classes in Dublin were greatly agitated. Owing, however, to timely and judicious disposition of the military and police forces the city was saved from much bloodshed. In 1867 the most serious of modern conspiracies, that known as the Fenian organization, came to light. The reality of it was proved by a ship being found laden with gunpowder in the Liverpool docks, and another with £5000 and 2000 pike heads in Dublin. The Habeas Corpus Act was suspended at one sitting by both Houses of Parliament and about 960 arrests were made in Dublin in a few hours. Dublin castle was fortified; and the citizens lived in a state of terror for several weeks together.

DUBNO, a town in European Russia, at the head of a department in the government of Volhynia, 154 miles west of Zhitomir, in 50° 25' N. lat. and 25° 44' E. long. Occupying a peninsula formed by the River Ivka, it is almost surrounded by water and marsh; and in its eastern corner it is defended by a somewhat dilapidated citadel separated by dry ditches from the rest of the town. It also possesses five Greek churches, of which two—the Transfiguration and the Exaltation of the Holy Rood—were formerly monasteries; it has also a Roman Catholic church and convent, a Jewish synagogue, a hospital for poor Jews, and various other Jewish institutions. Beer, mead, tobacco, bricks, and leather are all manufactured in the town; but a large number of the inhabitants, who are mainly of Jewish blood, obtain their living in other places.

Dubno is first mentioned in the chronicles under the name of Duben in 1100, when it formed one of the towns offered to David of Vladimir in compensation for the loss of his principality. In 1498 it received a charter from the grand duke of Lithuania, which was afterwards changed about 1507 for the Magdeburg rights. The Tatars, against whose attacks it had been fortified in the beginning of the century, laid waste the neighbourhood in 1577, but were gallantly repulsed from the town by Yanush of Ostrog. In 1793 it passed into the possession of the Linbomir family, to whom the most of the ground-rent is still due; in 1795 it was incorporated with Russia, and in 1796 it received its present rank. Population, 7600.

DUBOFKA, a burgh in European Russia, in the government of Saratoff, about 32½ miles to the N.N.W. of Tsaritzin, on the right bank of the Volga, near its reception of the river Dubofka, and on the post-road to Astrakhan. With the exception of about 200, all its houses are built of wood; but among its public buildings it numbers four Greek churches, a prison, a large public school, and a hospital capable of containing several hundred patients. Besides leather, tallow, soap, and tobacco, its inhabitants manufacture mustard on a large scale, obtaining the seed partly from their own fields and partly from other districts. They had formerly a very extensive share in the transport trade between the Volga and the Don, which was largely carried on by means of oxen, and supported a number of auxiliary crafts; but the opening of the railway about 1860 struck a sudden and fatal blow at the whole traffic. A great fair, lasting for a whole month, is held in the town every year, and produces a circulation of about 1,000,000 rubles, or upwards of £141,000. Dubofka, already in existence at an earlier date, was colonized by Cossacks in 1743, and became their chief settlement on the Volga, the residence of their ataman, and the seat of their military chancery. In 1770 it was fortified with wooden ramparts by Falk. Having given its support to the insurrection of Pugacheff, it was punished by the removal of 517 of its inhabitants to the Caucasus, where they formed a separate *polk*, or regiment. Their place was supplied by immigrants from the neighbouring governments and the country of the Little Russians, who were soon led by the advantages of their position to devote themselves exclusively to trade. Population in 1873, 12,737.

DUBOIS, GUILLAUME (1656-1723), cardinal, archbishop of Cambray, and first minister of France, was born at Brives-la-Gaillarde, in Limousin, September 6, 1656. He was the son of an apothecary, and at twelve years of age was sent to Paris to study in the college of St Michael, where he at the same time served in the household of the principal. He then engaged himself as a private tutor, and at length was appointed preceptor to the young duke of Chartres, afterwards the regent duke of Orleans. Astute, ambitious, and unrestrained by conscience, Dubois ingratiated himself with his pupil, and, while he gave him

formal school lessons, at the same time pandered to his evil passions, and encouraged him in their indulgence. He gained the favour of Louis XIV. by bringing about the marriage of his pupil with Mademoiselle de Blois, a natural but legitimated daughter of the king; and for this service he was rewarded with the gift of the abbey of St Just in Picardy. He was present with his pupil at the battle of Steinkirk, and "faced fire," says Marshal Luxembourg, "like a grenadier." Sent to join the French embassy in London, he made himself so active that by the request of the ambassador he was recalled. When the duke of Orleans became regent (1715), Dubois, who had for some years acted as his secretary, was made councillor of state, and the chief power passed gradually into his hands. His ambition grew with what it fed on. To counteract the intrigues of Cardinal Alberoni, first minister of Spain, he suggested an alliance with England, and succeeded in negotiating the Triple Alliance (1717). He was now made minister of foreign affairs. But he coveted the chief dignities of the church no less than political offices; and he impudently prayed the regent to give him the archbishopric of Cambrai, the richest in France. His demand was supported by George I, and the regent yielded. In one day all the usual orders were conferred on him, and even the great preacher Massillon consented to take part in the ceremonies. His next aim was the cardinalate, and, after long opposition on the part of the Pope, Clement XI., the red hat was given to him by Innocent XIII. (1721). In the following year he was named first minister of France (August). He was soon after received at the French Academy; and, to the disgrace of the French clergy, he was named president of their assembly. While the projects of Law were bringing financial ruin upon the kingdom, Dubois was accumulating from various sources an immense private fortune. In addition to his see he possessed the revenues of seven abbeys. He was, however, a prey to the most terrible pains of body and agony of mind. His health was ruined by his debaucheries, and a surgical operation became necessary. This was almost immediately followed by his death, at Versailles, August 10, 1723. His portrait was thus drawn by the duke of St Simon:—"He was a little, pitiful, wizened, herring-gutted man, in a flaxen wig, with a weasel's face, brightened by some intellect. All the vices—perfidy, avarice, debauchery, ambition, flattery—fought within him for the mastery. He was so consummated a liar that, when taken in the fact, he could brazenly deny it. Even his wit and knowledge of the world were spoiled, and his affected gaiety was touched with sadness, by the odour of falsehood which escaped through every pore of his body." In 1789 appeared *Vie privée du Cardinal Dubois*, attributed to one of his secretaries, and in 1815 his *Mémoires secrets et correspondance inédite*, edited by L. de Sevelinges.

DUBOS, JEAN BAPTISTE (1670–1742), an eminent French author, was born at Beauvais in December 1670. After studying for the church he renounced theology for the study of public law and politics. He was employed by M. de Torcy, minister of foreign affairs, and by the regent and Cardinal Dubois in several secret missions, in which he acquitted himself with great success. He was rewarded with a pension and several benefices. Having obtained these, he retired from political life, and devoted himself to history and literature. He gained such distinction as an author that in 1720 he was elected a member of the French Academy, of which, in 1722, he was appointed perpetual secretary in the room of M. Dacier. He died at Paris on the 23d of March 1742, at the age of seventy-two, repeating as he expired the well-known remark of an ancient, "Death is a law, not a punishment." His first work was *L'Histoire des quatre Gordiens prouvée et illustrée par des*

Médailles (Paris, 1695, 12mo), which, in spite of its ingenuity, did not succeed in altering the common opinion, which only admits three emperors of this name. About the commencement of the war of 1701, being charged with different negotiations both in Holland and in England, with the design to engage these powers if possible to adopt a pacific line of policy, he, in order to promote the objects of his mission, published a work entitled *Les Intérêts de l'Angleterre mal entendus dans la Guerre présente*, Amsterdam, 1703, 12mo. But as this work contained indiscreet disclosures, of which the enemy took advantage, and predictions which were not fulfilled, a wag took occasion to remark that the title ought to be read thus: *Les Intérêts de l'Angleterre mal entendus par l'Abbé Dubos*. It is remarkable as containing a distinct prophecy of the revolt of the American colonies from Great Britain. His next work was *L'Histoire de la Ligue de Cambray* (Paris, 1709, 1728, and 1785, 2 vols. 12mo), a full, clear, and interesting history, which obtained the commendation of Voltaire. In 1734 he published his *Histoire Critique de l'établissement de la Monarchie Française dans les Gaules*, 3 vols. 4to,—a work the object of which was to prove that the Franks had entered Gaul, not as conquerors, but at the request of the nation, which, according to him, had called them in to govern it. But this system, though unfolded with a degree of skill and ability which at first procured it many zealous partisans, was victoriously refuted by Montesquieu at the end of the thirtieth book of the *Esprit des Loix*. His *Réflexions critiques sur la Poésie et sur la Peinture*, published for the first time in 1719, 2 vols. 12mo, but often reprinted in three volumes, constitute one of the works in which the theory of the arts is explained with the utmost sagacity and discrimination. Like his history of the League of Cambray, it was highly praised by Voltaire. The work was rendered more remarkable by the fact that its author had no practical acquaintance with any one of the arts whose principles he discussed. Besides the works above enumerated, a manifesto of Maximilian, elector of Bavaria, against the emperor Leopold, relative to the succession in Spain, has been attributed to Dubos, chiefly, it appears, from the excellence of the style.

DUBOSSARI, or NOVIE DUBOSSARI, a town of European Russia, in the government of Kherson, on the left bank of the Dniester, 101 miles from Odessa, in 47° 16' N. lat. and 29° 9' E. long. It occupies a picturesque position, is surrounded by fertile fields and gardens, has two churches, a synagogue, and a public hospital, and contains from 7000 to 8000 inhabitants—Moldavians, Malo-Russians, and Jews—who are mainly dependant on the trade in the local wine and tobacco, though they also deal in timber, cattle, and grain. Dubossari was founded in keeping with the terms of the Russian peace of 1795, and received the epithet Novie, or Now, to distinguish it from the old town of Dubossar (Tombasari, or Tymbashan), on the right bank of the Dniester, in Bessarabia, which had been of considerable importance under the Tatar domination.

DUBROVNA, a town of European Russia, in the government of Mogileff, 11 miles east of Orsha, on the highway to Smolensk, in 54° 34' N. lat. and 30° 41' 9" E. long. Its wooden houses are ranged for the most part along the left bank of the Dnieper, and in the neighbourhood of the two streams Dubrovonka and Svinka; and among its public buildings are six orthodox churches, a Roman Catholic chapel, a synagogue, a hospital, and a Jewish high school supported by Government. The town is mentioned at a pretty early date, and frequently appears in the history of the 16th century. In 1514 it requested to be received into allegiance by Vasili Ivanovitch of Moscow; but after his defeat near Orsha it returned to Lithuania. In 1535 it was burned by Vasili Shuiski;

and in 1562, 1563, and 1580 it suffered a similar fate. The population, which is predominantly Jewish, amounts to 7600.

DUBUQUE, a city of the United States, capital of a county of the same name in Iowa, situated on the right bank of the Mississippi, 155 miles west of Chicago. The business portion occupies a terrace at no great height above the river, and the rest of the city is picturesquely arranged on the bluffs behind. Several of its fourteen churches, besides a so-called cathedral, are edifices of considerable pretensions; and the building erected by the United States for the custom-house, post-office, and other Government purposes is constructed of marble. The principal educational institutions are the high school and a theological seminary for German Presbyterians. As a port of delivery, a railway junction, and the centre of the lead region of Iowa, Dubuque has an extensive and varied trade, and engages in a large number of manufacturing industries; of lead alone it exports from 10,000,000 to 20,000,000 lb annually. The name of the city is derived from a French Canadian, who received permission from the Spanish Government to carry on mining in the vicinity, and settled on the spot in 1788. The first real settlement was in 1833; incorporation as a town was obtained in 1837, and a city charter in 1840. Population in 1850, 3108; in 1873, 22,151.

DUCANGE, CHARLES DUFRESNE, SEIGNEUR (1610–1688), a most learned historical and philological writer, was born at Amiens, December 18, 1610. His father, who was royal provost of Beauquesne, sent him at an early age to the Jesuits' College in Amiens, where he soon distinguished himself. Having completed the usual course at this seminary, he applied himself to the study of law at Orleans, and afterwards went to Paris, where he was received as advocate before the parliament in August 1631. Meeting with little success as a barrister, he returned to his native district, where he applied himself to the study of history. After the death of his father, Ducange married at Amiens, on 19th July 1638, Catherine Du Bois, daughter of a treasurer of France; and, in 1647, he purchased the office of his father-in-law, the duties of which in no degree interfered with the great literary works in which he had engaged. The plague, which in 1668 desolated Amiens, forced him to leave that city. He established himself at Paris, where he continued to reside until his death, which occurred on the 23d October 1688. In the archives of Paris he was enabled to consult charters, diplomas, titles, manuscripts, and a multitude of printed documents, which were not to be met with elsewhere. His industry was exemplary and unremitting; and the number of his literary works would be incredible, if the originals, all written in his own hand, were not still extant. He was distinguished above nearly all the writers of his time by his linguistic acquirements, his accurate and varied knowledge, and his critical sagacity. Of his numerous published works noted below the most important are the *Glossarium ad Scriptores mediæ et infimæ Latinitatis* and his *Glossarium ad Scriptores mediæ et infimæ Græcitatibus*, which are indispensable aids to the student of the history and literature of the Middle Ages. To the three volumes of Ducange's Latin glossary three supplementary volumes were added by the Benedictines of St Maur (1733), and a further addition of four volumes was made by Carpentier, a Benedictine, in 1766. The edition published at Paris in that year accordingly consisted of ten volumes. The edition by G. A. L. Henschel (8 vols., Paris, 1840–46) includes those supplements and further additions by the editor

1666, 4to. 3. Histoire de S. Louis, Roi de France, écrite par Jean, sire de Joinville. Paris, 1668, folio. 4. Joannis Cinnami Historiarum de rebus gestis a Joanne et Manuele Comnenis libri VI., Græce et Latine, cum Notis historicis et philologicis. Paris, 1670, folio. 5. Mémoire sur le projet d'un nouveau Recueil des Historiens de France, avec le plan général de ce Recueil, inserted in the *Bibliothèque Historique de la France*, by Père Lelong. 6. *Glossarium ad Scriptores mediæ et infimæ Latinitatis*. Paris, 1678, 3 vols. fol. 7. Lettre du Sieur N., Conseiller du Roi, à son ami M. Ant. Wion d'Herouval, au sujet des Labelles qui de temps en temps se publient en Flandres contre les R.R. P.P. Henschenius et Papebroch, Jésuites. Paris, 1682, 4to. 8. *Historia Byzantina duplici Commentario illustrata*. Paris, 1680, fol. 9. Joannis Zonaræ Annales ab exordio Mundi ad mortem Alexii Comneni, Græce et Latine, cum Notis. Paris, 1686, 2 vols. fol. 10. *Glossarium ad Scriptores mediæ et infimæ Græcitatibus*. Paris, 2 vols. fol. 11. *Chronicon Paschale a Mundo condito ad Heracli Imperatoris annum vigesimum*. Paris, 1682, fol. The last work was passing through the press when Ducange died; and, on his decease, it was edited by Baluze, and published with an eulogy of the author prefixed. His autograph manuscripts, and his extensive and valuable library, passed to his eldest son, Philippe Dufresne, who died unmarried, four years after François Dufresne, the second son, and two sisters, then received the succession and sold the library, when the greater part of the manuscripts was purchased by the Abbé Du Champ, who handed them over to a bookseller called Marquette, who re-sold part of them to Baron Hohenlof. The remaining part was acquired by D'Hozier, the genealogist. But the French Government, aware of the importance of all the writings of Ducange, succeeded, after much trouble, in collecting the greater portion of these manuscripts, which were preserved in the Imperial library of Paris. Among these manuscripts was one entitled *Gallia*, a work of great erudition, being a history of France, divided into seven epochs, with a number of dissertations.

See Feugère's *Essai sur la vie et les ouvrages de Ducange* (Paris, 1852).

DUCAS, MICHAEL, a Greek historian who flourished under Constantine XII., about 1450. The dates of his birth and death are unknown. He belonged to the illustrious family of his name that gave several emperors to Constantinople, and he is supposed to have held a high office at the court of Constantine XII. After the fall of Constantinople, he was employed in various diplomatic missions by the princes of Lesbos, where he had taken refuge. He was successful in securing a semi-independence for Lesbos until 1462, when it was taken and annexed to Turkey by Sultan Mahomet II. It is known that Ducas survived this event, but there is no record of his subsequent life. He is the author of a history beginning with the death of John Palæologus I., and extending as far as the capture of Lesbos in 1462. There is a preliminary chapter of chronology from Adam to John Palæologus I., which is almost certainly by a later hand. Although barbarous in style, the history of Ducas is both judicious and trustworthy, and it is the most valuable source for the close of the Greek empire. The author seems to have possessed an intimate knowledge of the Turkish language.

The *editio princeps* was issued by Bullialdus at Paris in 1649 with a Latin version and notes. This edition was reprinted at Venice in 1729. The work was edited by Bekker for the Bonn series of the Byzantine historians (Bonn, 1834). A French translation was incorporated by President Cousin in his *Histoire de Constantinople* (Paris, 1672). An early Italian translation, discovered by Von Ranke at Venice, is appended to the Bonn edition.

DUCHESNE, ANDRÉ (Latin, DUCHENIUS or QUERCETANUS) (1584–1640), a French geographer and historian, generally styled the father of French history, was born at Ile-Bouchard, in the province of Touraine, in May 1584. He was educated at Loudun and afterwards at Paris, where he studied under Julius Caesar Boulanger. From his earliest years he devoted himself to historical and geographical research, and his first work, *Egregiarum seu Selectarum Lectionum et Antiquitatum Liber*, dedicated to Boulanger, and published in his eighteenth year, displayed great erudition. He enjoyed the patronage of Cardinal Richelieu, a native of the same district with himself, through whose influence he was appointed historiographer and geographer to the king. He died in 1640, in consequence of having

Ducange published the following works — 1. Histoire de l'Empire de Constantinople sous les Empereurs François. Paris, 1657, folio. 2. *Traité Historique du Chef de S. Jean-Baptiste*. Paris,

been run over by a carriage when on his way from Paris to his country house at Verrière. Duchesne's works were very numerous and varied, and some idea of his industry may be gathered from the fact that, in addition to what he published, he left behind him more than 100 folio volumes of manuscript extracts. Several of his larger works were continued by his only son François Duchesne (1616–1693), who succeeded him in the office of historiographer to the king. The principal works of Andre Duchesne are—*Les Antiquités et Recherches de la Grandeur et Majesté des Rois de France* (Paris, 1608), *Les Antiquités et Recherches des Villes, Châteaux, &c., de toute la France* (Paris, 1610), *Histoire d'Angleterre, d'Écosse, et d'Irlande* (Paris, 1614), *Histoire des Papes jusqu'à Paul V.* (Paris, 1619), *Histoire des Rois, Ducs, et Comtes de Bourgogne* (1634, 2 vols. fol.), *Historiæ Normanorum Scriptores Antiqui* (1619, fol.), and *Historiæ Francorum Scriptores* (5 vols. fol., 1636–49). Besides these Duchesne published a great number of genealogical histories of illustrious French families, of which the best is said to be that of the house of Montmorency. His *Lives of the French Cardinals and of the Saints of France* have been published by the Bollandists, Mabillon, and others. He published a translation of the *Satires of Juvenal*, and editions of the works of Abelard, Alain Chartier, and Étienne Pasquier.

DUCIS, JEAN FRANÇOIS (August 22, 1733–March 31, 1816), a French dramatic poet, famous more especially for his adaptations of Shakespeare to the Parisian stage of the 18th century. He was born and brought up at Versailles, where his father, originally from Savoy, held the position of a respectable linen-draper; and all through life he retained the simple tastes and straightforward independence fostered by his bourgeois education. The friendship of Marshal Belleisle procured him an appointment as clerk, and even after he ceased to discharge the duties of his post secured the continuance of his salary. In 1768 the passion for the theatre which had been growing within him during the previous years found vent in the tragedy of *Amélie*; and the failure of this first attempt was fully compensated by the success of his *Hamlet* in 1767, and of *Romeo and Juliette* in 1772. *Œdipe chez Admète*, imitated partly from Euripides and partly from Sophocles, appeared in 1778, and secured him in the following year the chair in the Academy left vacant by the death of Voltaire. Equally successful was *Le Roi Lear* in 1783, at the representation of which the author received what was then the rare honour of being called before the curtain. *Macbeth* in 1783 did not take so well, and *Jean sans Peur* in 1791 was almost a failure; but *Othello* in 1792, supported by the acting of Talma, obtained immense applause. The next appearance of the author was no longer as an adapter or imitator of foreign models, but as a dramatist with a plot and characters of his own contrivance and invention; and though his contrivance produced nothing more original than the old story of unlawful love between brother and sister ultimately obtaining sanction by their supposed kinship being disproved, the poetic charm of the verse and its vivid picturing of desert life secured for *Abufar, ou la famille arabe*, a flattering reception. On the failure of a similar piece, *Phédon et Waldemar, ou la famille de Sibérie*, Ducis ceased to write for the stage; and the rest of his life was spent in quiet retirement at Versailles. He had been named a member of the Council of the Ancients in 1798, but he never discharged the functions of the office; and, when at a later date Napoleon wished him to accept some post of honour under the empire, he escaped from his solicitations by a happy brusquerie,—“General, do you like wild duck shooting? I am something of a wild duck myself.” Amiable, religious, and bucolic, he had little sympathy with the fierce, sceptical, and tragic times in which his lot was cast. “Alas!” he

said in the midst of the Revolution, “tragedy is abroad in the streets; if I step outside of my door, I have blood to my very ankles. I have too often seen Atreus in clogs, to venture to bring an Atreus on the stage.” Though actuated by what seems to have been an honest and ardent admiration of the great English dramatist, Ducis is not in any deep sense of the word Shakespearian. His ignorance of the English language left him at the mercy of such translators as Letourneur and La Place, and even this modified Shakespeare had still to undergo a process of purification and correction before he could be presented to the fastidious criticism of French taste. That such was the case was not, however, the fault of Ducis; and his works, defective as they were, did good service in modifying the judgment of his fellow countrymen. He did not pretend to reproduce, but to excerpt and refashion; and consequently the French play sometimes differs from its English namesake in everything almost but the name. The plot is different, the characters are different, the *motif* different, and the scenic arrangement different. The result is really a new play, and a new play, be it said, with undoubted merits of its own. *Le banquet de l'amitié*, a poem in four cantos, 1771, *Au Roi de Sardaigne*, 1775, *Discours de réception à l'Académie française*, 1779, *Épître à l'amitié*, 1786, and a *Recueil de Poésies*, 1809, complete the list of Ducis's publications. An edition of his works in three volumes appeared in 1813; *Œuvres posthumes* were edited by Campenon in 1826; and *Hamlet, Œdipe chez Admète, Macbeth, and Abufar* are reprinted in vol. ii. of Didot's *Chefs d'œuvre tragiques*.

See Campenon, *Essai de mémoires sur Ducis*, 1824, Onésime Leroy, *Étude sur la personne et les écrits de Ducis*, 1832, based on Ducis's own memoirs preserved in the library at Versailles; Sainte-Beuve, *Causeries du lundi*, t. vi., and *Nouveaux lundis*, t. iv.; Villemain, *Tableau de la litt. au XVIIIe. siècle*.

DUCK, a word cognate with the Dutch *Duycker* (Germ. *Tauch-ente*—and in Bavaria *Duck-antl*), the general English name for a large number of birds forming the greater part of the Family *Anatidæ* of modern ornithologists. Technically the term Duck is restricted to the female, the male being called Drake, and in one species Mallard (Fr. *Mallard*).

The *Anatidæ* may be at once divided into six more or less well marked subfamilies—(1) the *Cygninæ* or Swans, (2) the *Anserinæ* or Geese—which are each very distinct, (3) the *Anatinæ* or Freshwater-Ducks, (4) those commonly called *Fuligininæ* or Sea-Ducks, (5) the *Erismaturinæ* or Spiny-tailed Ducks, and (6) the *Merginæ* or Mergansers. Of the *Anatinæ*, which may be considered the typical group, we propose to treat here only, and especially of the *Anas boschas* of Linnæus, the common Wild Duck, which from every point of view is by far the most important species, as it is the most plentiful, the most widely distributed, and the best known—being indeed the origin of all our domestic breeds. It inhabits the greater part of the northern hemisphere, reaching in winter so far as the Isthmus of Panama in the New World, and in the Old being abundant at the same season in Egypt and India, while in summer it ranges throughout the Fur-Countries, Greenland, Iceland, Lapland, and Siberia. Most of those which fill our markets are no doubt bred in more northern climes, but a considerable proportion of them are yet produced in the British Islands, though not in anything like the numbers that used to be supplied before the draining of the great Fen-country and other marshy places. The Wild Duck pairs very early in the year—the period being somewhat delayed by hard weather, and the ceremonies of courtship, which require some little time. Soon after these are performed, the respective couples separate in search of suitable nesting-places, which are generally found, by those that remain with us, about the middle of March. The spot chosen is sometimes near

a river or pond, but often very far removed from water, and it may be under a furze-bush, on a dry heath, at the bottom of a thick hedge-row, or even in any convenient hole in a tree. A little dry grass is generally collected, and on it the eggs, from 9 to 11 in number, are laid. So soon as incubation commences the mother begins to divest herself of the down which grows thickly beneath her breast-feathers, and adds it to the nest-furniture, so that the eggs are deeply imbedded in this heat-retaining substance—a portion of which she is always careful to pull, as a coverlet, over her treasures when she quits them for food. She is seldom absent from the nest, however, but once, or at most twice, a day, and then she dares not leave it until her mate after several circling flights of observation has assured her she may do so unobserved. Joining him the pair betake themselves to some quiet spot where she may bathe and otherwise refresh herself. Then they return to the nest, and after cautiously reconnoitring the neighbourhood, she loses no time in reseatting herself on her eggs, while he, when she is settled, repairs again to the waters, and passes his day listlessly in the company of his brethren, who have the same duties, hopes, and cares. Short and infrequent as are the absences of the Duck when incubation begins, they become shorter and more infrequent towards its close, and for the last day or two of the 28 necessary to develop the young it is probable that she will not stir from the nest at all. When all the fertile eggs are hatched her next care is to get the brood safely to the water. This, when the distance is great, necessarily demands great caution, and so cunningly is it done that but few persons have encountered the mother and offspring as they make the dangerous journey.¹ If disturbed the young instantly hide as they best can, while the mother quacks loudly, feigns lameness, and flutters off to divert the attention of the intruder from her brood, who lie motionless at her warning notes. Once arrived at the water they are comparatively free from harm, though other perils present themselves from its inmates in the form of Pike and other voracious fishes, which seize the Ducklings as they disport in quest of insects on the surface or dive beneath it. Throughout the summer the Duck continues her care unremittingly, until the young are full grown and feathered; but it is no part of the Mallard's duty to look after his offspring, and indeed he speedily becomes incapable of helping them, for towards the end of May he begins to undergo that extraordinary additional moult which has already been mentioned (BIRDS, vol. iii. p. 776), loses the power of flight, and does not regain his full plumage till autumn. About harvest-time the young are well able to shift for themselves, and then resort to the corn-fields at evening, where they fatten on the scattered grain. Towards the end of September or beginning of October both old and young unite in large flocks and betake themselves to the larger waters, many of which are fitted with the ingenious appliances for catching them known as Decoys. These are worked on all favourable occasions during the winter, but the numbers taken vary greatly—success depending so much on the state of the weather. If long-continued frost prevail, most of the Ducks resort to the estuaries and tidal rivers, or even leave these islands almost entirely. Soon after Christmas the return-flight commences, and then begins anew the course of life already described.

The domestication of the Duck is doubtless very ancient, but evidence on this head is exceedingly imperfect. Several distinct breeds have been established, of which the most esteemed from an economical point of view are those known as the Rouen and Aylesbury; but perhaps the most

¹ When Ducks breed in trees, the precise way in which the young get to the ground is still a matter of uncertainty. The mother is supposed to convey them in her bill, and most likely does so, but further observation on this point is required.

remarkable deviation from the normal form is the so-called Penguin-Duck, in which the bird assumes an upright attitude and its wings are much diminished in size. A remarkable breed also is that often named (though quite fancifully) the "Buenos-Ayres" Duck, wherein the whole plumage is of a deep black, beautifully glossed or bronzed. But this saturation, so to speak, of colour only lasts in the individual for a few years, and as the birds grow older they become mottled with white, though as long as their reproductive power lasts they "breed true." The amount of variation in domestic Ducks, however, is not comparable to that found among Pigeons, no doubt from the absence of the competition which Pigeon-fanciers have so long exercised. One of the most curious effects of domestication in the Duck, however, is, that whereas the wild Mallard is not only strictly monogamous, but, as Waterton believed, a most faithful husband—remaining paired for life, the civilized Drake is notoriously polygamous.

Very nearly allied to the common Wild Duck are a considerable number of species found in various parts of the world in which there is little difference of plumage between the sexes—both being of a dusky hue—such as *Anas obscura* of North America, *A. superciliosa* of Australia, *A. pæcilorhyncha* of India, *A. melleri* of Madagascar, *A. xanthorhyncha* of South Africa, and some others.

It would be impossible here to enter upon the other genera of *Anatina*. We must content ourselves by saying that both in Europe and in North America there are the groups represented by the Shoveller, Garganey, Gadwall, Teal, Pintail, and Widgeon—each of which, according to some systematists, is the type of a distinct genus. Then there is the group *Aix* with its beautiful representatives the Wood-Duck (*A. sponsa*) in America and the Mandarin-Duck (*A. galeculata*) in Eastern Asia. Besides there are the Sheldrakes (*Tadorna*), confined to the Old World and remarkably developed in the Australian Region; the Musk-Duck (*Cairina*) of South America, which is often domesticated and in that condition will produce fertile hybrids with the common Duck; and finally the Tree-Ducks (*Dendrocygna*), which are almost limited to the Tropics. (A. N. Duck)

DUCKWORTH, SIR JOHN THOMAS (1748–1817) was an admiral, was born at Leatherhead, in Surrey, on the 28th of February 1748. He entered the navy in 1759, and obtained his commission as lieutenant in June 1770, when he was appointed to the "Princess Royal," the flagship of Admiral Byron, in which he sailed to the West Indies. While serving on board this vessel he took part in the engagement with the French fleet under Count D'Estaing. In July 1779 he became commander, and was appointed to the "Rover" sloop; in June of the following year he attained the rank of post-captain. Soon afterwards he returned to England in charge of a convoy. The outbreak of the war with France gave him his first opportunity of obtaining marked distinction. Appointed first to the "Orion" and then to the "Queen" in the Channel Fleet, under the command of Lord Howe, he took part in the three days' naval engagement with the Brest fleet, which terminated in a glorious victory on the 1st June 1794. For his conduct on this occasion he received a gold medal and the thanks of Parliament. He next proceeded to the West Indies, where he was stationed for some time at St Domingo. In 1798 he commanded the "Leviathan" in the Mediterranean, and had charge of the naval detachment which, in conjunction with a military force, captured Minorca. Early in 1799 he was raised to the rank of rear-admiral, and sent to the West Indies to succeed Lord Hugh Seymour. During the voyage on he captured a valuable Spanish convoy of eleven merchantmen. In March 1801 he was the naval commander of the combined force which reduced the islands of St Bartholomew and St Martin, a

service for which he was rewarded with the order of the Bath and a pension of £1000 a year. Promoted to be vice-admiral of the blue, he was appointed in 1804 to the Jamaica station. Two years later, while cruising off Cadiz with Lord Collingwood, he was detached with his squadron to pursue a French fleet that had been sent to the relief of St Domingo. He came up with the enemy on the 6th February 1806, and, after two hours' fighting, inflicted a signal defeat upon them, capturing three of their five vessels and stranding the other two. For this, the most distinguished service of his life, he received the thanks of the Jamaica Assembly, with a sword of the value of a thousand guineas, the thanks of the English Parliament, and the freedom of the city of London. In 1807 he was again sent to the Mediterranean to watch the movements of the Turks. In command of the "Royal George" he forced the passage of the Dardanelles, but sustained considerable loss in effecting his return, the Turks having strengthened their position. He held the command of the Newfoundland fleet for four years from 1810, and at the close of that period he was made a baronet. In 1815 he was appointed to the chief command at Plymouth, which he held until his death on the 14th April 1817. Sir John Duckworth sat in Parliament for some time as member for New Romney.
